MILL WORKINGS.—In the report of the Superintendent of the Navajo mine for the fiscal year, is the following statement: The mill run covers a period of 229½ days, of which the actual running time was 227½ days, showing a loss of 2½ days, including all stoppages of every nature incidental to a mill run. Milled 2243 1-10 tons of Navajo ore, and 121 1-20 tons of custom ore. The average battery pulp assay of the ore from the Navajo mine was $104 03 per ton, and was worked to 91 93 per cent of the battery assay. Custom ore averaged $122 81 per ton, and was worked to 91 per cent. The ore milled the past year was not of that character that would permit of the same quantity being crushed per stamp, and of being worked to quite as high a percentage, as the ore that is to be milled the coming year. At the commencement of the fiscal year just ended, the mill was undergoing repairs and improvements, necessitated by the long run made the year previous. The same was completed and milling resumed in November. Since which time, in view of the large amount of work for it in sight, it is hardly necessary to say that it has been kept in a good state of repair, and that its present condition guarantees the usual excellent results that had been attained in the previous years.

NEW SHAKING TABLE.—The *Salt Lake Tribune* says: Mr. Dyer, of Park City, was in town Wednesday evening. He says the tramway of the Crescent, the concentrating and sampling mills, will all be finished in the next thirty or forty days. Although it is not considered good policy for Superintendent Ferry to crowd the mine during the depression in lead, fifty or sixty tons a day are being shipped from the mine, and every ton taken out, paradoxical as it may seem, appears to disclose two additional tons not visible before. The ore concentrates finely. Some of it has been taken to Bingham and tried. It is said, by the way, that they have perfected a shaking table at Bingham that works cheaper and cleaner than the jig; that is cheaper in first cost, and that separates the lead from the pyrites. It comes to us rather indefinitely, but if true, it is of vast importance to Bingham, to the smelting and other incidental business interests of this city and valley.

ANCIENT GEOGRAPHY.—The bibliography of Ptolemy's geography, which Mr. Justin Winsor has been printing by instalments in the Harvard University *Bulletin*, has been issued separately, in advance of its completion in the *Bulletin*, and forms an interesting contribution (forty-two pages) to historical geography. It is particularly valuable for the information it gives regarding the early cartography of America, and the ante-Columbian views of the coast west of Europe. Such collateral matter seems to elucidate the subject. The name 'America' appears for the first time on a Ptolemaic scale in 1522; but reasons are given for believers that it occurred in print or in manuscript as early as 1513-15. It appears that copies from 1478 edition have been sold at eighty, ninety and a hundred pounds.

Bradstreet's says that times of industrial depression are prolific in discoveries and economic improvements that revolutionize almost the conditions of industry. Although there is no depression to complain of in our mining industry, there are signs that the problem of working millions of tons of low grade Bingham ores at a profit may be solved within a twelve-month.—*Salt Lake Tribune.*

THE new concentrator at the head of Carr Fork, Bingham, Utah, has been started up, on ore from the Frisco. The first run was a success, and fully justifies the owners in their enterprise.

JAPAN has a fishing population of 1,601,406. At their last National Fisheries Exhibition the Japanese showed 3,967 articles connected with fishing, and 6,474 kinds of goods made from fish aquatic plants.

MECHANICAL PROGRESS.

Improved Method of Generating Steam Power.

Much interest is felt among experts and others who are concerned in the manufacture and use of steam-power apparatus in the successful working of the new method of developing steam power, which is being introduced by the New England Motive Power Company of this city. The apparatus is in constant use at the works of the Hollowell Granite Company on Medford street, in the Charlestown district. It has been in use there some ten weeks, and gives entire satisfaction in respect both to the economical development of power and the saving of fuel, i. e. about 50 per cent of coal is saved, and the same amount of power is now developed by the use of one boiler of fifty-horse power that formerly was produced by this boiler and another one of thirty-horse power. The new method is not, however, wholly a matter of improved apparatus. The chief factor in this gain that is made, consists in the mingling of a certain proportion of methylic spirits of pure wood alchohol with the water for the boiler. The proportion has been varied in different experiments, but the engineer of the Granite Company has derived results most satisfactory on the whole by using 10 per cent of the spirits. The gain comes from the element of alcohol. There is no special virtue in this particular kind of alcohol, and the ordinary alcohol of commerce would serve as well, and might be preferred if it were as cheap. The advantage is that the admixture of alcohol permits the water to be vaporized considerably lower degree of temperature, namely, at 106 degrees of Fahrenheit, instead of, in case of water simply, 212 degrees. The apparatus does not require any different boiler construction, but it is an outside attachment which may be adjusted to any boiler. By means of it the compound of water and alcohol may be used over and over again during a period of weeks, so that the cost for alcohol after the first layout is very slight. The apparatus consists mainly of a condenser in combination with a three-cylinder pump. One cylinder forces the exhaust steam into the coils of the condenser, and another carries outside of the coils a volume of salt water drawn directly from the dock alongside the engine-house. The third is the vacuum cylinder, which is of service in returning the condensed vapor to the boiler. This vacuum cylinder serves also in another way by relieving the direct internal pressure of the boiler, so that while under the former method pressure as indicated by the steam gauge, of sixty-five pounds was employed, forty-five pounds are now found to be sufficient. Another advantage appears in the use of the alcoholic combination, in the gain of time required for getting up steam, but about half the time formerly required being now needed. A series of practical tests of this invention—which has been patented here and abroad—is now for progress at the navy yard in Washington, and a report giving results measured with scientific accuracy, will probably appear at an early date. The inventor of this process is Mr. William L. Lowrey, of Boston. Mr. W. S. Chamberlain, formerly general agent of the Hartford Steam Boiler Insurance Company, is the manager, with an office at 66 State street in this city.—*Boston Transcript.*

Journal Friction.

A paper was read before the Am. Soc. of C. E. by Mr. A. M. Wellington, giving the details and results of experiments with a new apparatus upon the friction of car journals at low velocities. These experiments were undertaken to test the correctness of a series of tests described in a previous paper, which are made by starting cars from a state of rest down a known grade and deducing the resistance from the velocity required. The present experiments were made by an apparatus in which the axle to be tested is placed in an ordinary latbe having a great variety of speeds, the resistance of the axle being measured by the levers connected with a yoke encircling the axle and transmitting the pressures to a suitable weighing apparatus. It was found important that this weighing apparatus should be direct, as, for instance, a platform scale rather than a spring scale. The result of these experiments as to initial friction were that friction at very low journal speed is abnormally great and more nearly constant than any other element of friction. This abnormal increase of friction is due solely to the velocity of revolution. At velocities slightly greater, but still very slow, the friction is still large, the co-efficient failing very slowly and regularly as velocity is increased, but being constantly more and more effected by differences of lubrication, load and temperature. A very slight excess of initial friction would generally be observed. There is no such thing in journal friction as a friction of rest in distinction from a friction of motion. The fact that friction of rest appears to exist is solely due to the fact that no journal or other solid body can be instantly set into rapid motion by any force however great. At ordinary operating velocities the character and completeness of lubrication seems to be much more important than the kind of oil used, or even the pressure or temperature.

Comparisons were made of experiments by Prof. Thurston and by Mr. Power and the experiments of the author. The rolling friction proper in railroad service seems to be very small indeed, not exceeding one pound per ton. As to the resistance of freight trains in starting, it is believed that the resistance at the beginning of motion in each journal is about 20 pounds per ton. A velocity of from one-half to three miles an hour must be obtained before the journal friction falls to ten pounds per ton. At six miles per hour the journal friction is at least one pound per ton higher than at usual working speeds. Temperature exerts a very marked adverse influence upon friction at low velocities. The velocity of lowest journal friction is from ten to fifteen miles per hour. With bath or other very perfect lubrication, as with pad or syphon, greater velocity is apt to decrease as to increase the co-efficient. The latter being more like the ordinary lubrication in railroad service, we may say without sensible error that the co-efficient of journal friction is approximately constant for velocities of fifteen to fifty miles per hour.

SOLDERING ALUMINIUM.—The use of aluminium in the arts has been much restricted by our ignorance of any method of soldering it, either to itself or other metals. Now, however, a French engineer, M. Bourbouze, has discovered a way of effecting both classes of the operation with ease. The process consists in plating both surfaces to be soldered, not with pure tin, but alloys of tin and zinc, tin bismuth, and aluminium, etc. Good results are obtained with all such alloys, but those containing tin and aluminium are the best. They should contain different proportions, according to the work the soldered parts have to do. For parts to be fashioned after soldering, the alloy should be composed of 45 parts of tin and 10 of aluminium, as it is sufficiently malleable to resist the hammer. Pieces thus united can also be turned. Parts which have not to be worked after being soldered may be united with a softer solder of tin containing less aluminium. This last solder can be applied with a hot soldering-iron, as one solders white iron, or even with a flame. Neither of these solders requires any prior preparation of the pieces to be soldered. It suffices to apply the solder, and extend it by help of the iron over the parts to be joined. When, however, it is desired to solder certain metals with aluminium, it is best to plate the part of the metals to be soldered with pure tin. It is sufficient then to apply to the part the aluminium plated with alloy, and to finish the operation in the usual manner.—*Engineering.*

SUGGESTION IN THE MANUFACTURE OF RAILROAD IRON.—Some one has suggested an improvement in the manufacture of steel rails for railroad iron, by running it off when in the molten or plastic state, something as lead pipe is made. A cotemporary referring to the above says: Some of the operations connected with the manufacture and working of metals are of such a nature as to suggest the reasons for this man's view. Castings are made of any length by running liquid metal into a mold. Lead pipe is made by causing the metal to "flow" through a suitable die by the intense effort of a hydraulic press, some of the points of the flow being almost identical with those to be noted in the use of a liquid metal. Mr. Bessemer nearly a generation ago made an excellent quality of sheet metal by pouring liquid steel between revolving rolls, by which the metal, as it cooled, was delivered on the other side in a quite perfect sheet. Other similar continuously flowing processes could be named, so that it will be seen that the railroad manager may have reasons as closely in his thought upon the subject, as any man could from the note which he had made of what he supposed were similar things.

AN IMPROVED ANVIL.—C. Fisher, of Trenton, N. J., claims to have devised a new method of covering anvil faces with steel, by which the steel is more intimately connected to the body of cast metal. Heretofore, in making anvils of this class, the bottom steel plate was first placed in the mold and the horn steel plate was placed upon it, the two plates partially overlapping one another in such a manner that the metal, when poured in, did not enter between the overlapping ends of the steel plates, and thus an insecure and imperfect connection was formed. To avoid this difficulty the inventor does not place one steel plate upon the other, but leaves a narrow space between them in the mold. In this way the molten metal is enabled to enter between the steel plates and to form a perfect joint. The metal is prevented from running through the open space between the plates by a dam of metal or sand core or similar device.

MALLEABLE IRON COOKING POTS.—The manufacture of malleable iron cooking vessels by a local stove manufacturing company is promised. Quite a number of straight stove pots have been turned out already, and they are satisfactory in every respect. Unlike cast iron pots, those made of malleable iron are practically indestructible, as the severest blows delivered against them and test actions of heat show.

SCIENTIFIC PROGRESS.

Animal Remains in Coal.

Professor Miall, F.G.S., in a lecture on "Animals of the Coal Period," recently delivered at York, England, said that there were to be found associated with seams of coal, and especially with beds of shale even below coal seams, the flattened impressions of various creatures which once had life. There had been seen shells and other fossils, and the squeezed impressions of the bodies of crustaceans or insects. These remains were, however, extremely fragmentary, and were as black as the shale in which they were embedded; it was, therefore, a matter of considerable difficulty to put them together, in order to find out their original shape or to what sort of animal they belonged. But during the last 100 years, a number of naturalists had engaged themselves in this task, and had brought to light a variety of results. Naturalists, indeed, believed that our common pond mussel was represented by an ally in that very remote period. It was found that the fresh water animals of the coal period were very much more like recent animals than were the marine forms of the earlier times like those of the present day. Many of the common shells of Europe were represented in extremely remote antiquity. But marine shells and other productions of the sea were not mixed up with the beds in which had been discovered land shells and the remains of land animals. All the marine productions kept, as it were, to themselves, and they were found in special beds or layers; but the marine beds seemed to mark the time when some low barrier which kept the sea at a distance was suddenly broken down, and the water of the ocean made an incursion upon either a fresh water area or a land area, and left behind it some marine shells.

Fossil centipeds, such as might now be commonly seen in our gardens and fields, had been discovered in coal measures. Scorpions, too, had been traced by their fossil remains, and thus proved to be closely akin to the scorpion of our own day. Cockroaches resembling in all essential features those with which most of us are familiar, had been discovered in considerable numbers, and those of the present time formed, perhaps, one of the most ancient types of animal life now to be found upon our planet. Then there came the crayfish, which could be tolerably matched nowadays. But there had been animals which had disappeared from the earth altogether, without having left behind them any animal very similar to themselves.

Science in the Workshops.

The Seth Thomas Clock Company has undertaken, under the advice and guidance of Mr. L. Waldo, the construction of clocks of a high grade of excellence for scientific purposes, which they propose to call clocks of precision. They have already made considerable progress as to the best form of pendulum suspension, and dimensions of the steel-jar mercurial pendulum and, as soon as the small physical laboratory they are now building for this purpose is completed, they propose to investigate some of the questions which make good clock-making such a difficult art; such as, the permanency of length of pendulum-rods of various materials, the effect of air mechanically contained in the ordinary mercurial pendulums, the effect of mercuric oxide and other impurities of the mercury, and the effect of temperature changes on various forms of pendulum suspension. This is another instance of the tendency shown by American artisans to avail themselves of the most recent knowledge to be derived from scientific research.

Some time since, we noticed that the Pratt & Whitney Company of Hartford were spending many thousands of dollars in their efforts to produce screws and other measuring-engines, which would accurately correspond to the established yard and metre. In this work they availed themselves of the assistance of Professor Rogers of Cambridge; and the results they attained must be gratifying to every student of physical science interested in having accurate screws and gauges for use independently or in connection with other pieces of apparatus.—*Science.*

CHEAP ALUMINIUM. Referring once more to the subject of cheap aluminium, which somewhat over a year ago formed so general a topic of conversation, it may be of interest to recall the fact that Mr. William Frischmuth, a German chemist of Philadelphia, some time since secured basic patents in different countries for a process that now produces aluminium in a commercial way at a comparatively low price, with almost a certainty of being reduced to $1 25 per pound avoirdupois when worked in a large plant with proper technical and practical management, ample capital and perfected mechanical and chemical means. Instead of using metallic sodium he uses a vapor produced or generated in a suitable vessel from a mixture of carbonate of sodium or other suitable compound of sodium, and carbon or other reducing agent; and this sodium vapor, not metallic sodium, as used in the De Ville process, is made to react in various ways upon the aluminous materials to produce aluminium. Both De Ville and Frischmuth have to use the double chloride of aluminium and sodium, although Frischmuth has a patent for his successful use of the double fluoride of aluminium and sodium in making aluminium. This is another great item of cost in making this metal. But Frischmuth has made improvements in making the double chloride of aluminium and sodium, that reduces its cost to a few cents per pound, and consequently that of the metal. It has been tested in New York, London and Paris in a commercial way, and can be sold at the market price. All manufacture has been in the experimental and developing way, and Frischmuth is said to have sold metal thus made to the extent of many thousands of ounces.

PRACTICAL SCIENCE.—European naturalists regard the attention paid in this country to economic entomology, and the aid that has been given it by various States and by the general Government, as one sign of "a practical people." With all the specialization in instruction in the foreign universities, we are not aware that there is more than one which supports a professorship of entomology. This is Oxford, where the venerable Professor Westwood honors the Hope foundation. In this country Harvard and Cornell each have their full professorship of this science; and to the latter a summer school, having special reference to agricultural entomology, has now been attached. This seems more appropriate than many of the summer schools now so much in vogue, inasmuch as the objects of study are at this season in the light of their investigations into the power of crops to sustain insect life. To further the interests of the school, the trustees of Cornell University have relieved Professor Comstock of his duties during the winter *semester;* and an unusually good opportunity is thus afforded to teachers, as well as others, to familiarize themselves with the principles of this branch of economic science.—*Science.*

STEEL VS. IRON FOR TIN-PLATE.—The great reduction in the cost of steel is encouraging the use of that metal, instead of iron, in the manufacture of tin-plate. The advantage of mild steel over iron for such works must be obvious to everyone, and all new works now starting in England for that manufacture are working on steel plates. The American market in particular is calling for steel. There is but little, if any, difference in the price. Buyers of perishable food in tin cans are beginning to display much caution in the purchase of said goods, in regard to the character of the cans; and those canning firms will possess a decided advantage who can satisfy the market that the plates of which their cans are made are of an unimpeachable quality. It is said that poison from the taint of fish, in particular, affected by the presence of air after tinning, is not generally due to faulty soldering of the can, but to the inferior quality of the plates out of which the cans have been manufactured. There is much less danger of faulty steel plate tin than where iron plate is used.

A CURIOUS EXPERIMENT.—A Parisian, M. Treves, has made the following curious mechanical experiment. Two steel tuning-forks brought to the same pitch were topped with small mirrors, and placed opposite to each other in two vertical planes at right angles. One of them, No. 1, was, moreover, surrounded with a strong coil of wire receiving an electric current from a nitric acid pile, composed of four elements. A fiddlestick being now drawn across each of the tuning-forks, the vibrations commenced, and immediately a perfectly motionless luminous circle was produced in the mirror of No. 2. But no sooner was No. 1 magnetized by the admission of the current, than the circle became an ellipse, and swayed to and fro, denoting the action of a new vibratory motion. As soon as the current ceased, the figure became a fixed circle again. This experiment may serve to investigate the vibratory powers of iron and steel, according to their composition and physical state.

POSTURES IN SITTING.—M. Delaunay, of Paris, has been making extensive investigations upon the subject of postures in sitting as regards the extremities. He finds that the Chinese cross the left arm over the right, while Europeans cross the right over the left. Robust children cross the right over the left. Those who cannot work or are idiotic do the contrary. A great many women cross the left leg over the right. Among opera dancers some always cross the right leg over the left, but not one crosses the left over the right habitually. Infants under three years cross the left arm over the right, and when older reverse the position. Men generally cross the right leg over the left, and he cites statements of tailors that trousers are more worn on the left side, which bears most of the weight. The inference remains that the left brain develops before the right, but finally the right predominates.

A POLICE FORCE OF ANTS.—A queer way of employing ants is reported by an English gentleman who has been traveling through one of the provinces of China. It appears that in many parts of the province of Canton the orange trees are infested by worms, and to rid themselves of these pests the natives bring ants into the orangeries from the neighboring hills. The ants are trapped by holding the mouth of a lard bladder to their nests. They are then placed among the branches of the orange trees, where they form colonies, and bamboo rods are laid from tree to tree to enable the ants to move throughout the orangery.

Staurday Morning, Aug. 30, 1884.

TABLE OF CONTENTS.

EDITORIALS.—The Frue Concentrator; A New Cable Grip, 129. Passing Events; Mining Appliances at the Fair; The Oregon Mechanics' Fair; Date of Location and Mining Surveys; Roasting Lead Ores, 132. Iron and Concrete Construction, 133.
ILLUSTRATIONS.—Taylor's Endless-Chain Grip for Cable Cars; The Frue Ore Concentrator, 129. Plans of Iron and Concrete Construction, 133-4.
MECHANICAL PROGRESS.—Improved Method of Generating Steam Power; Journal Friction; Soldering Aluminum; Suggestions in the Manufacture of Railroad Iron; An Improved Anvil; Malleable Iron Cooking Pots, 131.
SCIENTIFIC PROGRESS.—Animal Remains in Coal; Science in the Workshops; Cheap Aluminum; Practical Science; Steel vs. Iron for Tin-Plate; A Curious Experiment; Postures in Sitting; A Police Force of Ants, 131.
USEFUL INFORMATION.—To Stain Bone and Ivory; To Avoid the Shrinkage of Wool; Wire Rope and Hemp Rope; Chimneys in Olden Time; Milk vs. Ink; An Electrical Need, 135.
GOOD HEALTH.—Cholera; Stockings and Health, 135.
MISCELLANEOUS.—The Scrap Iron Trade; Gold Mining; The Art of Fusion, 130. The Strike at Bodie; Oil on the Waters, 135.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 136-7.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 140.

Passing Events.

The announcemeut of the defeat of the French in Tonquin by the Chinese has been the chief topic of conversation for a few days past. It is conceded that this war will be beneficial to San Francisco from a commercial point of view.

Just now we are in the midst of the season of fairs. The Mechanics' Fair in this city is drawing to a close after a successful exhibition. The fair at Sacramento will soon open, and then the Portland Mechanics' Fair will be inaugurated. The county agricultural fairs in this State are going on, and more are to come.

Mining news is somewhat quiet. Up at Coeur d'Alene work has been discontinued on the big ditch to bring in water to prominent claims; but, from what we could glean from the dispatch, this result is due more to lack of ready money to pay men than lack of faith in the claims.

THE Michigan copper mines no longer have the field exclusively. The Copper Queen and Old Dominion of Arizona are producing a good article of copper, for which ready sale is found in New York. The Colorado copper mines have for some years been contributing a fair quantity to the domestic supply. Montana has recently developed a copper mine that promises to eclipse all others. This is the Anaconda, and is largely owned by Haggin & Tevis of this city. This mine is already turning out large quantities, and shipments are being made direct to Swansea, at a profit of one-half cent over the best price that can be obtained in this country.

THE Alice mine, Montana, has declared another dividend, and the stockholders are happy. It is considered likely that the sinking of the main shaft will shortly be resumed from the 700-foot station, where it stopped four years ago. To accomplish this great work successfully, a Cornish pump has been ordered, which will be the only one in the Territory, with the exception of that on the Moulton, the sister bonanza of the Alice.

Mining Appliances at the Fair.

The display of mining appliances at the Mechanics' Institute Fair this year is not very large. There was a limited space in which to exhibit them. Moreover, much of the standard machinery has been placed on exhibition for San Francisco sight-seers before, and the manufacturers did not care to go to the expense this season. There are several articles, however, which attract attention.

Ore Mills and Breakers.

There are two ore mills in operatiou, one the Redstone patent and the other the Hill. The latter, which is called the "Triumph," we described and illustrated iu the PRESS a short time since. The machine has a capacity of from 12 to 15 tons of quartz per day with six horse-power. Mr. Hill is enabled to increase the crushing capacity of the machine by simply adding weight to the upper casting, which gives motion to the crushing rollers, which are V shaped. This mill attracts considerable attention, and is kept crushing quartz during the working hours.

The "Planet quartz mill," as Redstone's is called, has been on the market several years. He has a large and small mill on exhibition. The stamps are arranged in a circle, and strike every part of the dies at each revolution, and grind the entire circle. The cam moves backwards while the stamps are carried forward. The No. 1 mill weighs about 1,300 pounds.

The Radovich rock breaker is a comparatively new bidder for popular favor. It has a new mechanism for imparting motion to the jaws of the breaker. The jaws are arranged so as to be set close, for crushing quartz very fine, and the adjusting mechanism is of a new form. It is claimed to be a rock breaker and pulverizer in one. Mr. Radovich, makes, too, a prospecting breaker and assayer's pulverizer, which is exhibited also. It is of the same form as the large one, and will reduce ore to a fine pulp. It is made to work by hand or steam. It can be packed on a mule, being small and light, though strong.

Concentrator and Ore Feeder.

The only ore concentrator on exhibition is a new one, invented by L. Radovich. It is called the "Horse-shoe and Pan Concentrator." This concentrator is, as its name indicates, constructed in the form of a horse-shoe, with copper pan in center. The concentrator is wholly lined with copper, and it works on a new principle, different from any other concentrator now in use. It has no tranks, cog-wheels, joints or pinions. Its motion is intended to imitate that of the miner's pan, washing out gold. The machine is quite simple in appearance, and can be adjusted to different grades of sulphurets, free gold and other metals. They can be used like a rocker for saving fine gold in gravel or black sand, as well as in ores containing sulphurets. The inventor says it acts as a good amalgamator also.

The only ore feeder on exhibition is the Challenge, exhibited by the Joshua Hendy Machine Works. There is a standard machine well known wherever there are quartz mills, and of recognized effectiveness. The same may be said of the nozzle for hydraulic mining exhibited by the same firm.

Rock Drills and Pumps.

Mr. E. A. Rix has in operation one of the large National air-compressors, and also the Pacific rock drill. In this latter Mr. Rix has applied a mechanism of his own invention, which largely reduces the amount of air necessary to drive the drill. It can be applied to drills of the various types, and economizes their operation. The invention is a highly important one, and one we shall shortly give a more detailed description.

Mr. Dow exhibits among the pumps in his display a special sinking pump for mines, which has some new features. We shall also give a more complete description of this in a short time.

Silver-plated Amalgamating Plates.

Among the mining appliances on exhibition is a large silver-plated amalgamating plate, made in this city by E. G. Denniston. It is five feet by eight—40 square feet—the largest ever made in the world, though the works are fitted to make one eight by twelve feet, or 96 square feet.

The constantly increasing demand for these plates has created an important industry on the Pacific coast. Nothing has yet been found or invented, or probably ever will be, to take the place of these plates in saving gold. The great affinity existing between silver, copper and quicksilver forming an electric and chemical action to attract and save gold, cannot be supplied by any other process. These plates were first manufactured here, about sixteen years ago by E. G. Denniston, proprietor of the San Francisco Plating Works, 653 and 655 Mission street. Since then the demand has constantly increased. His works are the most extensive in the United States, in fact in the world, for this class of work. The reputation of his silver-plated amalgamating plates is world-wide, the manufacturer having sent them to every known mining country. Almost every quartz mill on the Pacific coast is using his plates with great success. A large number are in use in the Rocky Mountain mining States. To meet that trade he has an agency in Denver, Colorado, the Hendrie & Bolthoff Manufacturing Company, extensive manufacturers of mill and mining machinery.

Mr. Denniston has been very busy lately filling some large orders; but just now, is engaged on the largest order ever received, consisting of 1,500 square feet of silver-plated amalgamating plates for Alaska, amounting to about $5,000.

The extensive facilities, and first-class reputation of his amalgamating plates, has enabled him to secure this order from other competitors. The San Francisco Plating Works, has all the latest improvements, known to the business. The plating is done by a large Mather Dynamo Electric Machine. Every description of metal goods is plated here, with gold, silver, nickel, platina, bronze, etc. and finished in the highest style of the art. Visitors who care to see it will at any time be shown the interesting process of depositing metals by electricity.

Roasting Lead Ores.

By roasting an ore we wish to expel its sulphur, arsenic or antimony, and convert the metals in it into oxides, in which form they are best adapted either to be carried into the slag or into the metallic state during subsequent smelting. The roasting is carried out by exposing the ore to the action of heat and air, in consequence of which sulphur, arsenic and antimony are volatilized as sulphurous, arsenious and antimonious anhydrides, respectively, while the metals remain in the oxidized state. According to the apparatus in which the operation is performed, the result will be more or less complete. The roasting of arsenical and antimonial ores is rendered more difficult by the simultaneous formation of arsenic and antimonic acids, which combine with the metal to form arseniates and antimoniates. These compounds can only be decomposed by repeated additions of carbon and access of air, whereby the arsenic and antimoniac acids are reduced to their arsenious and antimonious anhydrides, and thus gradually volatilized.

Ores containing sulphide of zinc (zinchloride, spahlerite), are also difficult to desulphurize by roasting, inasmuch as zincic sulphate is always forming, which is only decomposed in a white heat. Mr. Stetefeldt found that sulphate of zinc is the most constant compound in the fire next to sulphate of manganese. While during the first two hours of roasting nearly all the sulphate of iron had been decomposed, there was still a large percentage of zincic sulphate undecomposed at the ninth hour. The behavior of zinc makes zinciferous ores hard to work. In the blast furnace any sulphate of zinc remaining undecomposed after roasting will be reduced again to sulphide. The substance goes partially into the matte, if any is forming, partially into the slag, which makes it thick and stiff. It also carries silver along, and thus gives rise to losses above and beyond those inherent to all metallurgical processes.

TWENTY years ago the price of bar copper in New York was 55c per pound. To-day 14c is the outside asking price, and last week there were sales of Lake copper at 13½c, equally good Arizona copper at 13¼c, and Colorado copper smelted at Taunton, Mass., at 12½c. These prices show a decline of 75 per cent in this article in the last two decades. The rates at present are the lowest ever known in the trade in this country. There is still a duty of 4c per pound on ingot copper, but it has failed to stem the downward tendency. The local product has been increased much more rapidly than the home demand.

Date of Location and Mining Surveys.

A case has recently been brought before the Secretary of the Interior on appeal from a decision by the Commissioner of the General Land Office, which involves the question as to whether the date of location shall be indicated on the approved plats of survey or not. The Ohio and Queen of the Hills lodes, in Uintah district, Utah, came in conflict. On October 25, 1882, the Queen of the Hills made application for survey, and on the 30th of the same month the Ohio did the same. On January 10, 1883, the Ohio filed application for purchase; on the 26th of the same month the Queen of the Hills applied for purchase, and the Register denied the application on the ground of conflict with the Ohio. The Land Office held the Ohio lode entry for cancellation, upon the ground that the Queen of the Hills application, having been regular, was an appropriation of the land, and that the Register and Receiver's action in allowing the Ohio lode application and entry was "wholly unauthorized, and contrary to law and the uniform practice of this office."

It appears that, although the Queen of the Hills application was filed prior to that of the Ohio lode, the location and survey of the latter claim nevertheless antedated the location and survey of the former. Such state of facts would seem to account for the further fact that the official plat of survey of the Queen of the Hills showed the existence of a conflict with the Ohio lode, while such plat of the latter showed none. The Register and Receiver allowed the application for the former claim, because none had been made or filed for the latter, and they allowed the application for the latter because the official plat of the survey thereof "*showed no conflict of any kind.*"

The Secretary of the Interior decides that in this they erred. They should instead have treated the junior application as an adverse claim, since the conflict in question had been shown to exist by the record of the senior application, and thereupon stayed all proceedings, except the publication of the Queen of the Hills' notice of application, until the controversy had been settled by a court of competent jurisdiction, or the adverse claim waived. It was competent for the Ohio lode claimants to adverse the Queen of the Hills lode, but they were misled by the Register and Receiver's erroneous action, in allowing their application and failing to stay proceedings. It was not competent for the Register and Receiver to allow the junior application. Such procedure having been manifestly erroneous, should be corrected in so far as the department has power to afford the opportunity, and to this end the parties should be remitted to a court of competent jurisdiction. The Secretary instructs the Land Office in future to require Surveyors General to indicate the date of location on the approved plats of survey.

The Oregon Mechanics' Fair.

The sixth annual exposition of the Portland Mechanics' Fair, Portland, Oregon, will open October 9th and close Oct. 25th. This is an annual exhibition similar to the Mechanics' Fair in San Francisco. The prospects are that the forthcoming fair in Portland will be the most successful ever held. E. W. Allen, Esq., the genial Superintendent, has recently visited the Mechanics' Fair in San Francisco, and he reports that, in addition to the interest which is felt at home in the Portland enterprise, several of the present exhibitors at San Francisco will make a display of their wares or machinery at the Portland exposition. This is as it should be. Mr. Allen speaks highly of the courtesies extended to him by the officers of the Mechanics' Institute, especially by Messrs. Cornwall, Gilmore and Culver, and he believes he left for home freighted with many ideas that will contribute to the success of the enterprise which he has in hand. The Portland Association owns an exposition building, and its interests each year are placed in the hands of a board of managers selected from among the most enterprising business men of the city. The following are the present officers: President, J. B. Congle; Vice-president, Jas. Lotan; Secretary, Gustaf Wilson; Treasurer, Wm. M. Ladd; Superintendent, E. W. Allen.

SIX Michigan copper claims have this year paid $1,315,000 in dividends, against $2,670,000 for the whole of 1883, while from the start these claims have paid $32,390,000 to date.

Iron and Concrete Construction.

(Read before the Technical Society of the Pacific Coast by P. H. Jackson.)

Several experiments were made in London, in 1876, by Mr. Thaddeus Hyatt, assisted by Mr. Thomas Kirkaldy, author of the text book entitled "Experiments on Wrought-iron and Steel," on Mr. Hyatt's invention of combining wrought-iron bars as tie metal, and so prepared as to prevent any slipping when placed into and near the bottom (the weak part) of a Portland cement concrete beam in which they were enclosed and became united to it.

The first application of the tie metal is capable of furnishing all the tensile strength needed but with a straight beam the tie must be qualified to resist cross-strain equally well at any part, the tie must of necessity be attached to the web practically throughout its entire length as firmly at one point as at another.

The object of such fastenings not being to prevent the tie from bursting away from the web in a downward direction because of such tendency, but to counteract the tendency of the shearing stress.

This discovery of the true relations existing between

A Tie and its Web,

Also demonstrating the sufficiency of the cohesive power of the web itself to hold the tie in connection to the top of the beam, whether such web is concrete or metal, is due to the difference of the thickness necessary for this purpose.

Where the web is of concrete instead of metal, being proportionate to the difference between the cohesive strength or power of metal and concrete.

It is important to make use of ties having the greatest friction surface for side adhesion, hence flat, thin ties with projections are preferable, but the invention comprises other shapes where the surface is roughened, or may be crimped, corrugated, indented, or with pins, bosses, or projections of any kind.

There is not that tendency to buckle or lateral inclination when under strain with a concrete beam as in that of an iron one, due to the thickness of the web.

The arrangement of the blades or ties as shown in the gridiron from plate 32, and others being the most effective and simple.

The Application of the Ties to the Concrete Body.

In the application of these ties to a Portland cement concrete body what action are the different parts subjected to when employed? The upper portion of a concrete body resists compression, of which Portland cement is known to possess this property to a great degree compared to its property to resist separation. General Gilmore says, the proportion at the age of 9 months is 14 of resistance to compression, to 1 of resistance to extension, while cast iron is but 6½ to one of tension.

In General Gilmore's work, entitled "Coignet Beton and other Artificial Stone," on page 34, is as follows:

The strength of English Portland cement to resist compression from trials made of a block 9

When a Beam or Slab

Of this, or any other material of like nature, is loaded on its top surface, the upper part being in compression, is greatest at the top surface, and diminishes gradually until it ceases about midway of its depth, or wherever the neutral axis may be; and from there extension or tent dency to separate the parts begins in the leas and increases gradually until the bottom sur-

Fig. 1.

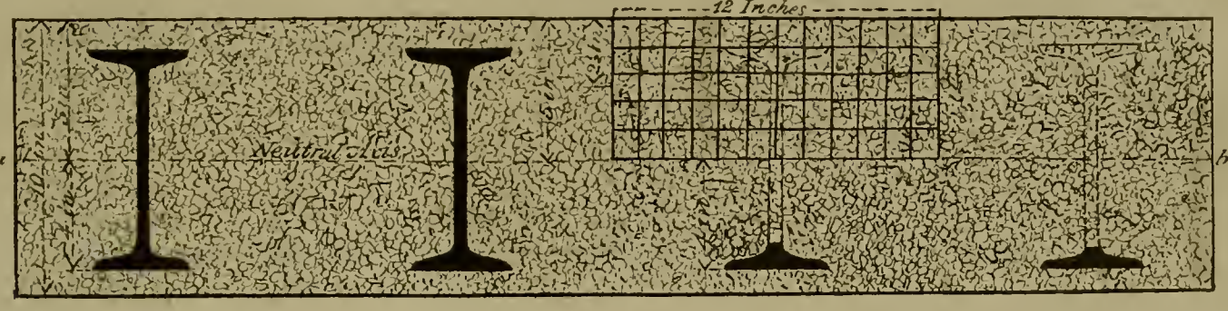

FIG. 1. SECTION OF PORTLAND CEMENT CONCRETE FLOOR WITH WROUGHT IRON BEAMS

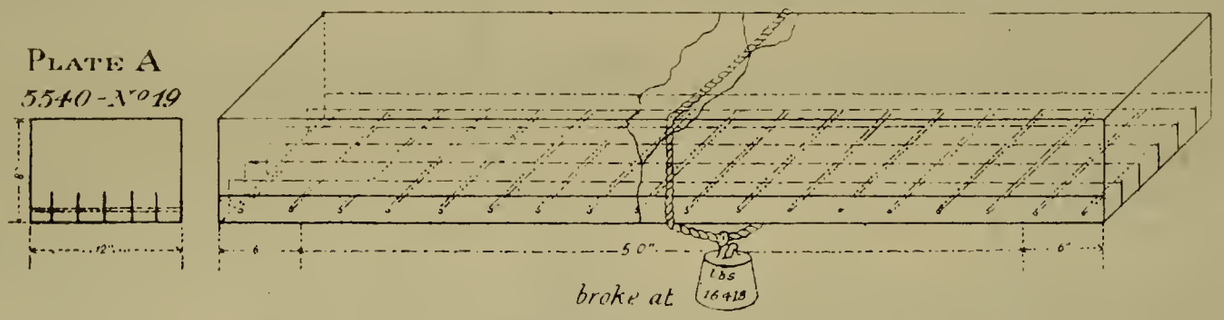
face is reached, which is the greatest.

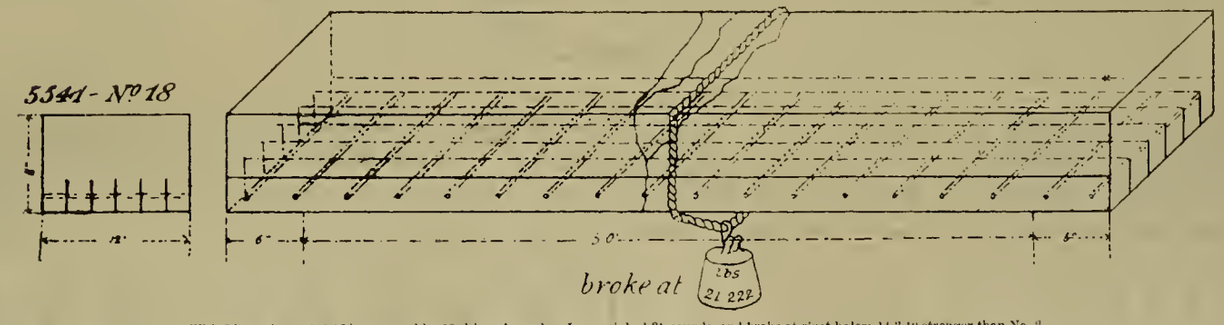
These iron ties with projections close together, or roughened surfaces extend the length of the tie, and for holding to the cement and side adhesion to the body of the tie, are placed as near to the bottom of the cement or concrete body as practicable, so as to be firmly held there.

It is intended to have that part of the con-

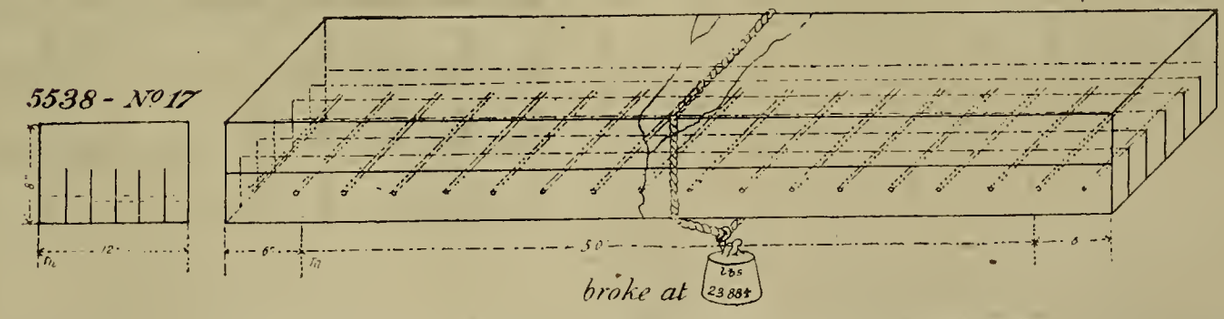
PLATE A



With 7 iron plates, 2x1-16 in., crossed by 18 ¼ in. wire rods. Iron weighed 21 pounds, and broke at rivet holes; 11½ times stronger than No. 2.



With 7 iron plates, 3x1-16 in., crossed by 18 ¼ in. wire rods. Iron weighed 31 pounds, and broke at rivet holes; 14 3-10 stronger than No. 2.



With 7 iron plates, 4x1-16 in., crossed by 18 ¼ in. wire rods. Iron weighed 41 pounds, and broke at rivet holes; 16 times stronger than No. 2.

to balance the compressive resistance of the other material, so that all metal may be dispensed with but the tie only, and that hard baked bricks and cement possess in themselves cohesive power and strength sufficient to perform the functions ordinarily performed by a metallic web.

The improvement consists in so preparing or making the iron ties with bosses or raised portions formed upon the surface of common bar or hoop iron roughened or studded with pins, or several blades threaded on wires, the binding power of the cement holding them firmly in position, preventing the possibility of any slipping or sliding of the material one over the other when the beams or structure is under strain.

For Resisting the Thrust

Of a bow string girder or arch, a tie may be made dependent on the two end fasteuings only; months old was 5,973 pounds per square inch. With one volume of sand, same age 2,631 pounds per square inch, and on pages 53 and 54 is as follows:

It is known that the strength of Portland cement mortars does not reach its maximum limit within a period of two, or perhaps three years.

Neat cement in blocks of the size of an ordinary brick, at the age of nine months, the compressive to its tensile strength becomes in the ratio of fourteen to one. With a mixture of one of cement and two of sand, the ratio will be found between the limits of fourteen to one and nineteen to one. This exhibits the tensile weakness of Portland cement, compared to its great resistance to crushing, and by the application of the ties in the manner employed by Mr. Hyatt renders the feeble part equal to its strong compressive property.

crete body to resist compression fully up to, and may be in excess of, the tensile strength of the iron ties, as the formulated calculation is based on the tensile strength of the ties.

We have by this combination a cheap and simple method of utilizing the strength of a Portland cement concrete body, compressively considered, without its weak tensile resistance entering into the calculation.

The formula for computing its strength, providing the ties are kept at a proper distance below the neutral axis, is as that for computing the strength of a made-up wrought iron beam or girder; that is, after the top and bottom sections, each way from the neutral axis, are adjusted in their respective resistances.

Mr. Wyatt's disquisition of the results of his experiments with this construction is set forth, entitled "An account of Experiments with Portland Cement Concrete Combined with Iron

as a Building Material," of which the following is an extract:

Fig. 1 represents a section of a

Portland Cement Concrete Floor,

With rolled wrought iron beams built in it. When employed, what function do the several parts perform? The top surface resists the greatest compressive force, which gradually diminishes downward until the neutral axis, *a b*, is reached, where it ceases to exist. From there commences the minimum of tensile strain, which increases until the bottom surface is reached, which is the maximum of the tensile strain. Referring to Fig. 1, what sustaining function does the concrete flooring with the integral parts thereof perform? The parts of iron beams above the neutral axis, *a b*, are worthless, and a consequent useless expense, as their resistance at that place to compression is not brought into action; the Portland cement concrete unassisted, as will be shown, has a greater power of that resistance than the case requires. To the right, in Fig. 1, the part laid off in square inches from the neutral axis *a b* to the top surface is 5 inches, and a width of 12 inches, making an area of sixty inches.

If we take the compressive resistance of Portland cement concrete at 200 pounds per square inch (in General Gilmore's experiment nine months old one of cement and two of sand crushed at 3,631 pounds per square inch), we get a mean of 1,000 pounds acting two and a half inches, or half way between the neutral axis and top surface; therefore we have 60 square inches of 1,000 compressive pounds to the inch, equalling 60,000 pounds acting on the end of a lever two and a half inches from the fulcrum. The neutral axis, *a b*, $60 \times 2\frac{1}{2} \times 1{,}000 = 150{,}000$ pounds to resist compression and to balance tension below the neutral axis.

This is without that part of the iron beam above the neutral axis doing any duty.

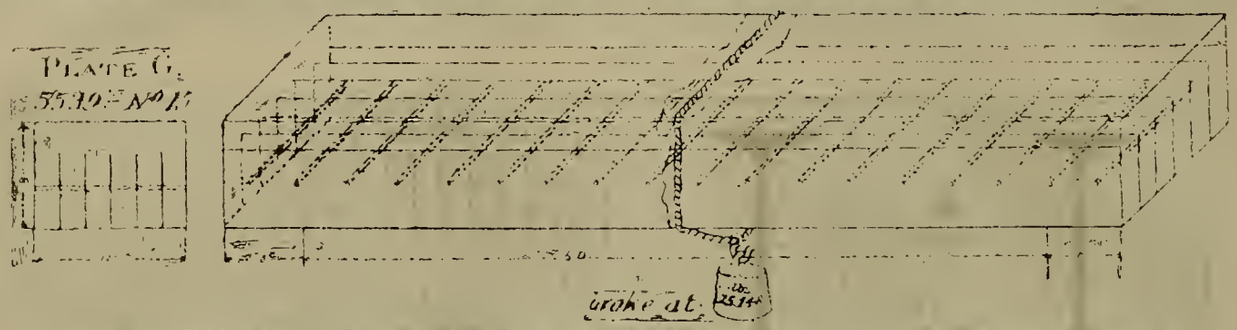
Then if we take the metal *D* (the bottom flange of the beam only, the shaded part) held in the concrete in the manner described, at 2 inches wide and one quarter of an inch thick, equal $2 \times \frac{1}{4} = \frac{1}{2}$ inch square of iron, and assuming the tensile resistance of wrought iron at 25 gross tons or 56,000 pounds per square inch, then the half inch tie represents 28,000 pounds, multiplied by the leverage of four inches down from the neutral axis which is the fulcrum to both, we have 28,000 pounds multiplied by 4 inches leverage equals 112,000 pounds.

The compressive surface of the concrete, 150,000 pounds, is therefore in excess of the demands of the tie metal, and the top flange and web of the iron beam are useless and only the bottom flange is employed. Therefore about three-quarters of the beam is of no avail.

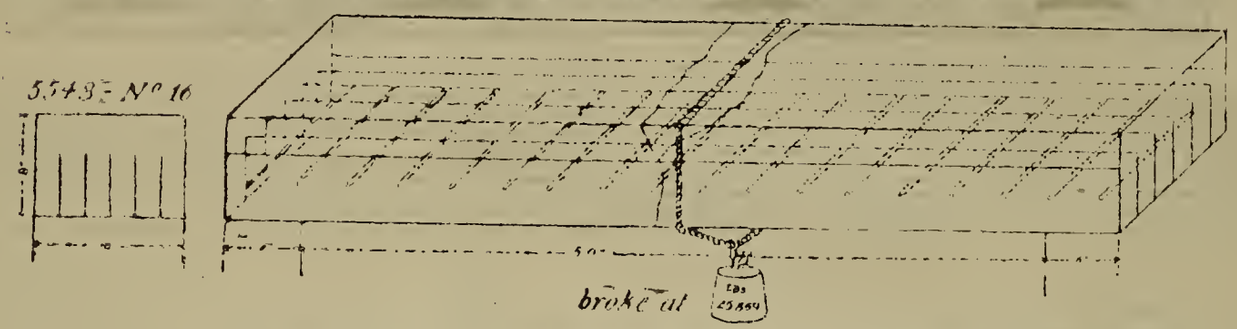
Many have questioned the possibility of uniting metal to concrete as a bottom flange is held to its web in a rolled or riveted beam, and as to whether when under strain the two materials will act in concert.

The answers to these queries is by reference to plates *A* and *G*, Nos. 15, 16, 17, 18 and 19, as being five examples in thirty-one experiments. Several trials were made without projections on the ties, and in every case pulled through the concrete.

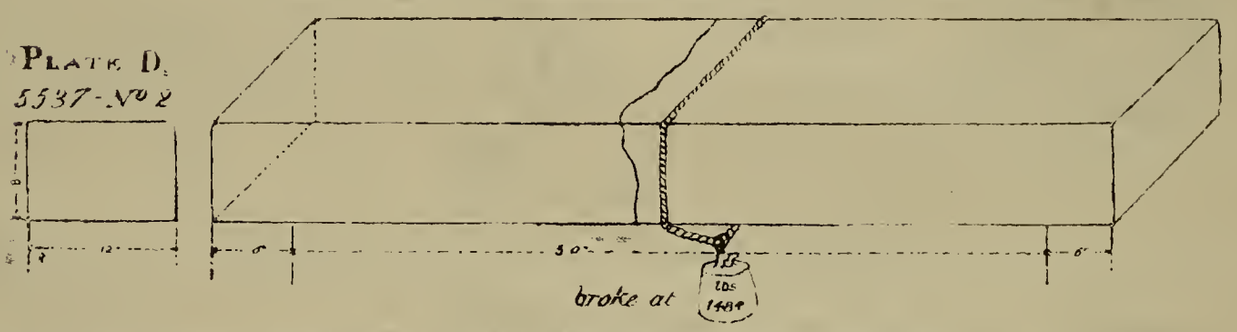
A study of them shows from the breaking of the metal: Firstly, that all the blades of the iron were perfectly held in the concrete body while the beam was under strain. Secondly, that in both cases the two materials worked in perfect harmony. Thirdly, that the proportionate power of the metal increased regularly as it became tie metal.



With 7 iron plates, 6x1-16 in., crossed by 18 ¼ in. wire rods. Iron weighed 62 pounds, and broke at rivet holes; 17 times stronger than No. 2.



With 7 iron plates, 5x1-16 in., crossed by 18 ¼ in. wire rods. Iron weighed 52 pounds, and broke at rivet holes; 17.4 stronger than No. 2.



Concrete only, composed of two parts of crushed stock bricks and one of cement, broke at only 1,484 pounds.

The 2x1-16 inch blades of beam, No. 19, exhibited a greater tensile power in proportion to cross section than 5,543, No. 16, where the blades were five inches in depth; the higher the blades, the more they loose as a tie, as the strain proportionately diminishes the nearer the tie metal is to the neutral axis. Therefore, the ties in all cases must be a proportionate distance below the neutral axis.

When a beam of any kind is subjected to a bending stress, it becomes more or less curved by virtue of which the lower portion is lengthened, and the upper portion shortened, in proportion to the depth of the beam or the difference of length between the radii of the curves.

Were the beams made up of horizontal layers the effect of the stress would be to cause these to slide one upon another, but the beam being solid the particles are held together by their own cohesion, the shearing strains being thus opposed by cohesive force.

The primary strains in the beam or the lines of compression and extension being upon curved lines the disturbed particles must of necessity tend to arrange themselves in harmony with the radial lines of circles, all below the neutral

(*Concluded on page 141*).

The Strike at Bodie.

The report being circulated last evening that two more strikes had been made in the New Standard, and that hereafter all visitors would be excluded, the *Free Press* reportor took occasion to call at the mine, and made a hurried examination of the new developments.

It was found in the advancement of every foot since the last visit that the ledges showed stronger and richer, while some of them are rapidly widening out. The succession of stringers in the tunnel, as mentioned in last report, proves to be an immense body of vein matter, all of which can be worked to advantage. This comprises what the boys call the "bonanza ledge," and as depth is attained will prove something extraordinary. No. 3 ledge shows much richer in gold, while it still carries a large percentage of silver. It is from 3½ to 4 feet in width, and will assay high up into the hundreds.

Just before reaching the face of the tunnel a "horse" was encountered, and passing through it quartz stringers again come in, and in the face blue or greenish quartz similar to No. 3 appears, showing the close proximity of another important ore-body.

Shaft No. 4 was the particular object of inspection. It has been sunk to a depth of about 70 feet all the way on the ledge. At the bottom a strike was made, the peculiarity of which differs from any other formation in this district. The eastern foot-wall is plainly defined, and next to it is a large stratum of soft white quartz, carrying lots of gold and is very similar to that of the Bodie Con., but the opposite wall is not in view as proved by picking to be all quartz. In the face of the drift is shown porphyry, clay and ore, every particle of which is heavily charged with gold. One quartz vein running from overhead to the bottom and several inches in width, literally sparkles with gold, and will go from $12,000 to $60,000 per ton. A bucket of rock from this shaft dumped into a ton of the lowest grade would make an average of $40 or $50 per ton.

The peculiarity spoken of is noted in all of the gold belts wherein the precious metal appears from wall to wall mixed in porphyry, clay and quartz. A specimen of porphyry lies on our table which shows coarse and fine gold in quantities seldom ever seen even in pure quartz. It is a study and a curiosity, like also the formation, for any scientist or miner. The boys now have about 94 feet of ledge matter that would all mill with profit. A large quantity of ore is extracted and negotiations are pending for the purchase of the Miners' Mill. The working of a few tons will put the owners in circumstances and enable them to further develop what now bids fair to become the biggest and richest mine ever worked in Bodie.—*Bodie Free Press.*

Oil on the Waters.

Gunner Cushman, who started north in the *Onualaska* with Lieutenant Stoney to explore the river in Alaska discovered last year by the latter officer, has been obliged to return to this city on account of ill health. The schooner reached the northern latitudes after many struggles. Before reaching Onualaska the schooner rode out two very severe gales, described by those on board as the most severe they had ever known in their sea-faring experience. In the first, when the gale struck the little vessel it threw her on her side, with the galley under water. Only by letting everything go was she righted again. For a few moments those on the schooner believed that their last hour had come. However, they succeeded in laying-to under close reefed foresail, and remained in that condition eleven days before it was safe to proceed on their way. When the vessel was first thrown over on her side, great seas swept clear over her.

When the skies indicated the approach of another gale, preparations were at once made for it. The vessel lay-to under close reefed foresail, but when the gale struck her it proved even more severe than the first one. For a while the vessel lay quite comfortable, but as the wind and rain increased, the position of the vessel became perilous in the extreme. Every minute it was feared that the sail would be blown out of the bolt rope and great combers threatened to sweep the vessel's deck. In this emergency Lieutenant Stoney decided to try the effect of a drag and of oil. He had had a drag made some time before, expecting to find use for it. It consisted of a triangular sail, to the lower corner of which a ninety-two pound anchor was attached, while the upper edge was secured to a spar. A four-inch hawser was attached to the spar. Attached to the spar, also, was a receptacle for holding oil and so constructed that the oil would be forced out by the waves themselves. The apparatus was then thrown overboard and the vessel so maneuvered that the drag stood off the weather bow.

The result was most satisfactory and surpassed the expectations of those on board. The immense waves were reduced so much in size and came so quietly that the vessel rode smoothly. All the waves were affected, but the great foaming combers more than any other. So great was the force of the storm that the four-inch hawser parted, and the vessel was again obliged to depend on her sail. The force of the gale, having, however, been broken, it was no longer a difficult matter to lay-to.

USEFUL INFORMATION.

To Stain Bone and Ivory.

The following most approved methods for this purpose, we copy from *The Manufacturer and Builder*:

For a Red Stain.—Boil shavings of scarlet cloth in water, adding by degrees pearlash until the color is extracted. The color may then be cleared with a little alum, and the liquor strained through a linen cloth. Steep the ivory or bone in dilute aquafortis (1 acid to 2 water); then remove and steep in the scarlet dye until the color is satisfactory. The aquafortis should not be too strong, and the articles should not remain in it too long. The safest plan is to make a preliminary trial with a strip of ivory, and as soon as the acid is observed to cause a trifling roughness of the surface, it should be removed and placed in the dye liquor, which should be kept warm, but not too hot. A little practice, with these precautions, will enable one to produce any desired shade of coloration. If it be desired to have any parts of the bone or ivory uncolored, it will be necessary to cover such parts with wax or paraffin, through which the stain will not penetrate. For Black Stain.—Dissolve nitrate of silver in three times its bulk of water, and steep the bone or ivory in it for about an hour; then remove and expose to sunlight, when the piece will quickly assume an intense black. For Green Stain.—Steep the work in a solution of verdigris and sal-ammoniac or weak aquafortis, in the proportion of two parts of the former to one of the latter. The aquafortis should have the same strength as that indicated in the receipt for red, and the period of immersion should be gauged carefully. For Blue Stain.—The work should be stained green as just indicated, and then dipped into a strong solution of pearlash in water. For Yellow Stain.—Place the work in a solution of alum in water, and keep boiling for some time; then remove and immerse in a hot infusion of tumeric in water. Let the work remain simmering in this infusion for about half an hour, and the yellow stain will be finely developed. In all these operations it should be observed that bone or ivory should dry very gradually, or it will crack or split.

To Avoid the Shrinkage of Wool.—It is very doubtful if any practicable method of washing woolen goods so they will not shrink can be devised, says the *Manufacturer and Builder*. "The structure of the individual fibers of the wool is such that they have a tendency to mat together when wetted, and especially when friction is applied to them in this condition. This is due to the fact that the wool is supplied with barbs or hooks, by means of which adjacent fibers readily attach themselves to each other, and by the existence of which the operation known as "felting," is made possible. Nevertheless, Dr. Tillman affirms the following plan avoids the shrinkage of woolen articles, and we give his procedure for what it is worth: The garments are to be soaked for several hours in a warm, moderately concentrated solution of soda, to which half a tumblerful of ammonia water has been added, more or less, according to the quantity of clothing. They are then to be washed out after the addition of some warm water, and rinsed in fresh water. The same result will follow, according to this authority, by adding a tumblerful of ammonia to a small tub of water, soaking the articles in this for half an hour, and then rinsing them in pure water. In the above, it will be observed, rubbing or friction is avoided, and reliance placed on the clensing action of strong alkali for the removal of grease or dirt. This is probably the explanation of any virtue the method may have."

Wire Rope and Hemp Rope.—Wire rope of the same strength as new hemp rope will run on the same sized sheaves; but the greater the diameter of the sheaves, the longer it will wear. Short bends should be avoided, and the wear increases with the speed. The adhesion is the same as that of hemp rope. Wire rope should not be coiled or uncoiled like hemp rope, but should be wound upon a reel. When substituting wire rope for hemp rope, it is well to allow for the former the same weight per foot which experience has approved of for the latter. As a general rule, one wire rope will out-last three hemp ropes. To guard against rust, stationary rope should be oiled once a year with linseed oil, or kept well painted or tarred. Running rope, while in use, requires no protection. Where great pliability is required, the center or core of wire rope is made of hemp, and small sized rope is generally made with hemp centers. Running rope is made of fine wire, and standing rope of coarse wire. Wire rope made from charcoal-made iron is fully one-fourth stronger than the ordinary rope. The standing rigging of a vessel, when composed of wire rope, is one-fourth less in weight than when of hemp.

Chimneys in Olden Time.—In the year 1200 chimneys were scarcely known in England. One only was allowed in a religious house, one in a manor house and one in a great hall of a castle or lord's house, but in other houses the smoke found its way out as it could. The writers of the fourteenth century seemed to have considered them as the newest invention of luxury. In Henry the Eighth's reign the University of Oxford had no fire allowed, for it is mentioned that after the students had supped, having no fire in winter, they were obliged to take a good run for half an hour to get heat in their feet before they retired for the night. Hollinshead, in the reign of Elizabeth, describes the rudeness of the preceding generation in the arts of life. "There were," says he, "very few chimneys; even in capital towns the fire was laid to the wall and the smoke issued out at the door, roof or window. The houses were wattled and plastered over with clay, and all the furniture and utensils were of wood." In 1589 a tax of two shillings was laid on chimneys.

Milk vs. Ink.—"Not every one knows," says a daily paper, "that if ink is spilled on a carpet or a woolen article it can be removed without leaving a trace. This is very easily done if the ink is attended to while still wet. Take clean blotting-paper or cotton batting, and gently sop up all the ink that has not soaked in. Then pour a little sweet milk on the spot, and soak it up from the carpet with fresh cotton batting. It will need to be renewed two or three times, fresh milk and cotton being used each time, and the spot will disappear. Then wash the spot with clean soap suds, and rub dry with a clean cloth. If the ink has been allowed to dry, the milk must remain longer and be repeated many times, but, with perseverance, every particle of the offending liquid can be made to disappear."

An Electrical Need. "We want," says Edison, "to get electricity from coal direct, without the intervention of boiler and engine. A good many people are at work on it. We don't see our way at all to it, but I will say it is surely possible. Zinc and other metals we can get into electricity at once, but the trouble is to do it with coal and carbon. If we could, we would get six horse power from one pound of coal, while with the boiler and steam engine we get only one-horse power from three pounds of coal."

Hay water is a great sweetener of tin, wooden and iron ware. In Irish dairies everything used for milk is scalded with hay water. Boil a handful of hay in water, and put in the vessel when hot.

GOOD HEALTH.

[Translated for the PRESS from the German by CHAS. TROPPMAN.]

Cholera.

This dreadful and death-striking disease hails from the hot climate of the Orient. Its reappearance in Europe has been oftener than that of the pest, and through that medical science has come nearer to solve the problems of its origin, contagency and its cure. It has been discovered that its contagency is due, and only due, to the stools of the afflicted, and that through social intercourse with the afflicted it may never be caught. Wherever the stools of cholera patients undergo further decomposition, the germs of the disease will be taken up by the air.

Therefore we infer that an epidemic must appear whenever the excrements from cholera patients, whether it be at their hight or at their beginning, are emptied into closets which are visited by perfectly healthy persons.

Of course, improper sewerage, dampness, bad water and food, filthy ways of living in general, assisted by bad closets, may bring it about, and generally amongst the most thickly settled parts of a town, where the poorer classes so generally live in a filthy and unhealthy condition. None are excepted, young or old, male or female; but it is certain that these people whose stomach and bowels are sometimes afflicted by some trouble or another, are more apt to be taken down by cholera than others. Diet is a great item in this disease, it having been noticed that on Monday—since Sunday gives occasion to excesses—always more cases were reported than on other days. The period of its appearance from its inoculation may be from one to three days; although cases are known where six days had elapsed since the poisonous germs had been inoculated. One particular case has been noted in the epidemic at Vienna in 1870. A young lady working as a collector in a coffee saloon, who on her day off visited her mother, which happened once a week, her mother living in a part of the city where cholera was raging. Five days after her visit she was taken down, and on the sixth was dead. She was perfectly well on the evening of the fifth day, and had no symptoms of cholera; but after closing the store, the powerful poisons made themselves felt.

We have three forms of cholera. The lightest form consists of a watery discharge from the bowels; but even such stools produce the poisonous germs of cholera, and bring about the epidemic, and sometimes in its severest form.

The second and more deadly form, emesis, is united with the watery stools. In this form the stools already have the appearance peculiar to cholera, they having a yellow color, and no more odor, and look like rice-water. These rice-water stools are a characteristic sign of cholera. Through the continuous emptying of the bowels a large amount of water is taken from the system, and a terrible thirst will appear.

In the third form, the most deadly of all, another symptom is added to these already mentioned, namely, the cramp-like contraction of some of the muscles, generally the muscles of the shaft. This third form is generally the result of either the first or second form, which had continued for some days, through which it seems the whole contents of the bowels are emptied; but whenever the patient is required to take to a vessel, he is always surprised that it is filled, when he leaves it. But most patients do not know in what danger they are, and are careless enough not to ask for medical assistance, though before they had always asked for it, when but slight cramps troubled them. The passage of the bowels repeats itself quickly in succession, the discharged masses being large and thin, and soon look like the rice water discharge. After the second or third passage, many of the afflicted are overtaken by extreme weakness, or even faint, so that they cannot reach their bed from the vessel without assistance. At the same time a powerful contraction of the shaft muscles, and a terrible thirst sets in, which increases after each passage, the result being, the more they drink the sooner vomiting will set in. The weakness of the patient increases rapidly, and his voice becomes soundless—cholera voice, the passages continuing to pass off, right along; the kidneys cease to fulfill their function; the powerful and painful shaft cramps become more severe, and repeat themselves oftener; the pressing thirst cannot be quieted, and in addition to all these frightful symptoms, the patient is overtaken by a peculiar feeling of fright and danger. Since this, his appearance has undergone a large change, his eyes are sunk down in their orbits, the nose becomes pointed, the cheeks have fallen in—cholera face. The skin on the hands becomes shriveled, like that of washer-women, the lips and the whole body has a blueish tint. The pulse is not felt in most cases an hour after the appearance of cholera; the circulation of the blood becomes more and more incomplete, and since less and less blood reaches the surface of the body, the temperature sinks, particularly on uncovered places, to that of a dead body. Patients seldom complain of headaches, oftener about black spots appearing before their eyes, noise in their ears and faintness. The patient will not close his eyes when the eyeball is touched; these symptoms will continue from six, twelve, twenty-four hours. The sudden stoppage of the action of the bowels is generally accepted by the surrounding friends as a good sign, but it is only a paralysis of the muscles of the bowels, and the patient dies without any pain.

In cases not resulting in death, the bowels move less frequently and less in quantity, the pulse may be felt, the blueness of the skin disappears, the stools get to be colored and an odor or constipation appears, the action of the kidneys begins again, and the patient improves gradually. In some cases the patient improves only to fall into the deadly hands of typhus or typhoid.

Places not affected with this horrible disease, should quarantine themselves against infected places. Closets where the stools of cholera patients had been emptied should not be used. Into these strong solutions of sulphate of iron and chloride of lime should be poured, to prevent the formation of the cholera germs and prevent those already formed from being carried by persons from these infected closets to health houses and places. That it is an excellent way to move from such houses, need not not be mentioned, and those whose means allow them, to travel to some unafflicted town, should do so without hesitation. Never use a strange closet, and an excellent way is, never to use the closets in their own home, but always use a vessel. Watery discharges and rumbling sounds in the stomach, should always be cause enough to call in a physician, and until the appearance of the doctor, the patient may go to bed; he should take one or more cups of black, strong coffee, with a little good cognac, also some suitable prescription. The cure, of course, is left entirely to the physician, but he will use some of the following medicines: Opium, ice-champagne, and cold application over the region of the stomach. Milch and meat juice bouillon respectively, should be about the only nourishment given to the patient.

The Cholera seems to be making its dreaded march over continental Europe, and has already reached Liverpool, whence it must soon find its way to London. There seems to be every prospect that, before the month of August is over, this dreadful scourge will reach American shores, no matter what precautions are taken at our seaports to stay its progress. In that event, the business depression would be much worse than it is at the present time, especially should this disease invade our large manufacturing centers, which it is likely to do if it crosses the ocean. A translation of an article from the German, in relation to the cause and prevention of the cholera, which will be found in another column, will be found of special interest in view of the above probability.

Stockings and Health.—White stockings are coming again into vogue. Doctors have discovered that the sole of the foot absorbs dyes, whether black or colored, and that a continuous process of slow blood-poisoning is going on among those who use colored hosiery. The origin of several new diseases that have lately appeared is attributed by medical men to the pernicious dye-stuffs which are used in the manufacture of stockings.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLEAN-UP.—*Ledger*, Aug. 23: The clean-up of the Telegraph Hill gravel claim, situated in Upper Rancharia district and owned by George Evans and M. F. Fitzgerald, was made recently, and realized about $3,000 for not quite four months' run. The water supply has given out for the season, but drifting operations will be carried on to a limited extent until water can be had. There are no gravel claims at work at present in the district.

MISCELLANEOUS.—The last run of the Lighthouse mine, near Butte City yielded $9 per ton, an increase of 50 per cent over the previous run. The Plymouth Consolidated has declared its usual monthly dividend of 50 cents per share. The derrick operated by a Knight wheel put up by the Volcano Gold Gravel Mining Company, on their claim at Volcano basin, is about completed. It is hoped that this plan will prove a success. The enterprising stockholders have sunk a large amount of money in this mining venture, with altogether inadequate returns so far.

IN LITIGATION.—Cor. *Ledger*, Aug. 23: Hostilities on Mahoney hill continue. The statement in my last that Mr. Stewart took the ditch water for salary, was an error. It seems that the Lincoln mine, according to articles of agreement with the Mahoney, has the first right to the water, the Mahoney being entitled to the surplusage. Mr. Stewart in making preparations to start up the Lincoln mill, gave the Mahoney Company two weeks notice that they must make other arrangements for water. At expiration of the time Mr. Stewart with a force of men disconnected the Mahoney pipe, and turned the water to the Lincoln. Mr. Morgan, who was in San Francisco at the time, was at once notified of the occurrence, and immediately started back, and on his arrival proceeded with a number of men backed by a double-barreled shotgun, and replaced the pipe in its former position, where it still remains. The matter is in the courts for unravelment or further entanglement.

CANAL BREAK.—*Sentinel*, Aug. 27: The Amador canal had a serious break near its head on Monday, entirely shutting off the water supply and compelling suspension of work at mills. The cannon-ball quartz mill recently put up at the Dewitt claim is said to work satisfactorily. It has a capacity of ten tons in 24 hours and can be run with 20 inches of water. The ore is pulverized exceedingly fine. A new quartz prospect has been obtained on Sutter hill, near Botto's. It is said to have produced some very good looking rock.

Calaveras.

WEST POINT.—Cor. Calaveras *Chronicle*, Aug. 23: The mining interests are undergoing a complete revolution, and old mines that have long lain idle will begin life anew and turn out their pro rata of gold along with those now in working order. For some years past a majority of our principle quartz veins have undergone a great change; sulphurated rock has taken the place of the decomposed quartz that was always free-milling and found above the water level. The question has long been a hard problem as how to extract the gold from the sulphurated quartz that is found below water level. It has been known for some time that only half the gold was ever saved by the present milling system out of the sulphurated rock, and although numbers have tried they have only partially succeeded, which of course would not pay. Now comes the Russell process to the front, which from its simplicity and the confidence reposed in it by the many who have seen it in working order gives it a substantial basis, and they are confident, along with the owners that it will revolutionize and eventually take the place of others in this district in the extraction of gold from the sulphurated quartz, no matter how base. Messrs. Schives and Russell have struck some splendid quartz in the Lockwood mine and are working it full-handed, night and day, by a whim shaft south and an engine shaft north. Both shafts are on first-class rock. The shaft on the Point mine has been cleaned out and newly timbered, and men are now engaged in sinking on the lode, which shows considerable gold. The Bismarck mine owners are stopping out rich quartz; about 40 tons in the mill and plenty more in the mine. The Scorpion mine is at present idle, owing to a defect in the affairs of the company, not in the mine I assure you. The Billy Williams mine is again to be opened by Messrs. Rowe and Jenkins. The Blazing Star mine is awaiting machinery. The Old Henry mine looks splendid. The Mexican mine will soon be in operation under the superintendence of Mr. T. Waters. The Wide West is short-handed; plenty of good rock on the dumps. Good rock has been struck in the Greeley mine on Bear creek.

El Dorado.

PYRAMID MINE.—*Mountain Democrat*, Aug. 23 Supt. Hotchkins will at once erect a fine 10-stamp mill on this old mine, which is located near Rose Springs in White Oak township. The ore in this mine carries a very large proportion of sulphurets, and it is believed by those who have worked it in the past that the Pyramid will prove a fine paying property.

BETTER THAN EVER.—Supt. Roberts, of the Crystal mine, Mud Springs township, was in town last Monday, and left with L. Landecker a specimen of remarkably fine quartz for exhibition at the county fair. The ledge where this piece was taken out is full six ft wide, and nearly half sulphurets, which assays $892 per ton. The Crystal is a fine paying mine.

Fresno.

QUARTZ MOUNTAIN.—Mariposa *Herald*, Aug. 23: Joe Swanstrom, of Coarse Gold gulch, Fresno county, was in town this week, and from him we gathered the following items of news: Quartz Mountain is the scene of lively mining operations at this time, about fifty men being at work. The company have located a town and are rapidly putting up houses. Two saloons are already running and a church will soon be built to counteract their evil influences. A contract has been let to build a canal from the San Joaquin river to the mines, the canal to be finished by the 1st of November. A great deal of money is being spent by the company and great results are expected. It is said that a smelter will soon be in operation at Mt. Raymond, and if the results are satisfactory a double and twisted boom may be expected at that place in about six weeks. The people at Fresno Flats, who own most of the claims, have the utmost confidence in their value.

Humboldt.

RICHNESS.—Trinity *Journal*, August 23: The quartz mines on New River bid fair to prove even richer than at first expected. Clifford & Co. made another clean-up a few days ago, after a run of eleven days with their arastra, which is a small one, and took out $3,500. Smith B. Brooks was in town this week, and tells us that he has discovered four ledges which prospect, but most of his work has been done on the Mary Blane. On this ledge they are now forty feet, and Mr. Brooks says they have seen gold in the rock every day. The lode is well defined, averaging about two feet in width. Other ledges in the district continue to increase in size and richness as they are developed. One 5-stamp mill is now going up and others will speedily follow. A new trial to the mines is proposed, by way of North Fork and Rattlesnake, the distance from Weaverville by this route being only 57 miles. There are about 75 men in the district at present, and two stores, two saloons, and a hotel already running from the nucleus, of what will next season be the most flourishing quartz mining town on the coast.

Inyo.

BULLION.—Inyo *Independent*, Aug. 23: Last week 20,000 pounds of bullion were shipped from Keeler for Selby & Co., San Francisco. The bullion belonged to the owners of the Molock mine. A few men are at work at Mammoth; they are getting out fair ore.

Mono.

A COLLAPSE.—Homer *Mining Index*, Aug. 23: Early Thursday morning Under-sheriff Wilcox arrived from Bridgeport and attached the May Lundy mine and personal property, to satisfy a debt of $12,592 due Rosenwald, Coblentz & Co. In the afternoon of the same day George W. Penter attached the same property (including the mill) for $7,372.35, making a total of $19,964.35. It is understood that on the same day Donnelly & Hune will sued out an attachment for about $1,700. The day shift in the mine worked half a day Thursday, when the miners held a meeting, appointed one of their number to hold possession for them, and then retired from the hill. The Sheriff also put in a keeper at the mine and another at the mill. The mill was run until 9 o'clock Thursday evening and then shut down. So far as learned no liens have yet been filed against the property for labor or materials, the men having confidence that a settlement will be made before the expiration of the time allowed by law for filing liens. The entire indebtedness of the property, including the bills attached for labor, material and last year's taxes, is variously estimated at from $38,000 to $45,000, and it seems to be the general impression that the whole of this will be paid within a reasonable length of time—that is, without allowing the law to take its course—whether the expected private sale takes place or not. The collapse has cast a gloom over the business and laboring men of the community, and still the foreknowledge that some such crisis was inevitable relieved the blow of the greater portion of its force, and our people are disposed to feel somewhat cheerful, if not jubilant, over the long-wished-for change, even though it comes in the guise of disaster. Yesterday the hoarding houses were refused further credit from the stores, and were compelled to shut out all who were without money—and perhaps one hundred of the May Lundy miners were, as they had not received any pay for nearly two months. This brought about a crisis, and the unpaid men, unwilling to submit to a "freeze out" game, called a meeting at Abbott Hall last night and quietly resolved to "eat." A committee waited upon Rosenwald, Coblentz & Co., and asked that firm to furnish the men with provisions until the 1st proximo, taking their time checks for security, which Mr. Rosenwald consented to do.

STANDARD CON.—Bodie *Free Press*, Aug. 25: They extracted and shipped to the mill 540 tons of ore, and 620 tons of tailings. We received from the ore 93 ounces of crude bullion, and from the tailings 460 ounces, which will be milled and shipped with this week's run on the 1st instant.

BODIE CON.—During the past week 200 tons of tailings were worked at the mine, the average assay made was $8 per ton. They have now reached the Mono line on the 55 level and will commence crosscutting as soon as we have the timbers in place. Thirty-seven men employed.

CON. PACIFIC.—Since last reports the drift on Pacific No. 1 has been advanced 32 ft from chute. The ledge is looking better than at any time since work was resumed. A number of assays made during the week have been more satisfactory than any heretofore obtained, ranging from $7 to $200, and making an average of $72.

NEW STANDARD.—Everything is running along nicely at the mine. The owners have a force of 10 miners working in the mine. They purchased or C. C. Stevenson of Virginia City the Miners' mill, which is being overhauled and will be ready to steam up on the 5th ultimo. A contract has been entered into with Marden & Son for hauling the ore. Wood for the winter's run is being delivered at the mill.

BULWER CON.—South drift No. 3, 500 level, has connected with workings from the Bodie mine. The vein is small and of low grade.

Mariposa.

DILTZ MINE.—Cor. Mariposa *Gazette*, Aug. 23: I have started a shaft and am now down on the vein 14 ft, which shall will strike the old car level at a depth of 100 ft, and about 30 ft north of the head of the tunnel. The vein at the surface was merely a fissure, but is now nearly one foot thick and the ore is a fine decomposed quartz or sand, and prospects well with fine gold. I think the developments which will accrue from the sinking of this shaft will prove most conclusively all that has been said of this mine, viz., that it is worth to a company or corporation, a sum not to exceed less than $200,000, and the day is not far distant when capitalists will be eager to have it.

Nevada.

EAGLE BIRD MINE.—*Transcript*, Aug. 22: Most encouraging reports continue to come from the Eagle Bird quartz mine, above the town of Washington. The shaft has attained a depth of 150 ft and shows a ten-foot vein of good average ore in the bottom. At this point drifts are being run to the north and south. At the 80-foot level the north drift is in 90 ft with the vein 7½ ft thick at the head of the drift, while the south drift, which shows a 4½-foot vein, is in 220 ft. The ore taken from the 80-foot level averages $13.60 in the mill, while that from the 150-foot level averages over $19 a ton. It is the intention of the owners to sink 400 ft, when if the good indications hold out a 20 or 30-stamp mill will be built.

MINING INJUNCTION.—Nevada *Herald*, Aug. 23: The Mayflower Mining Company, operating on Canada Hill, was enjoined Tuesday from working their mine by the hydraulic process. They will clean up and close down in a few days. It was the intention of the company to drift their claim at some future day, provided a channel was found in the hill, and the hydranlicing was being done to demonstrate whether a channel exists there or not.

MARYLAND MINE.—Grass Valley *Union*, Aug. 24: The 6-ft Pelton water-wheel to drive the pumping and hoisting works of the Maryland mine has been set up, and all connections made with the Idaho pipe line, and by the last of the present week the water will be turned on. The pressure will be over 300 ft, sufficient to drive all the machinery under a head of about 20 inches of water. A two-compartment shaft is opened and timbered from the surface to the drain tunnel, a depth of 125 ft, and below that point is 20 ft deep. When the works are started up this 20 ft of shaft will be immediately pumped out and the work of sinking resumed, miners being already employed for that purpose. An 8-inch pump will be used in sinking, and is now on the ground, with all the connections, to be put in place as soon as needed. Beside the works, which are new and conveniently arranged, a separate building 18x24 is being put up to be used as a storehouse and office. The work on the mine is being done under the superintendency of Mr. S. P. Dorsey, who is the principal owner of the Maryland property. The sinking of the shaft is to be prosecuted vigorously, and good results are confidently anticipated.

Plumas.

WILL START UP.—*National*, Aug. 23: It is reported on good authority that extensive operations will soon commence on the Indian Valley mine again, and that the work of opening it will be vigorously prosecuted. Mr. Geo. P. Cornell, who will be in charge of operations there, is now in the lower country, completing his arrangements, and will soon be back. We are pleased to hear this report. The Indian Valley has proved one of the best mines in Plumas, an in the opinion of mining men it will put forth a large amount of "bullion" for years and years to come.

HALLSTED MINE.—Another run of about six tons of quartz was put through the water arastra at the Hallsted mine last week, and the clean-up showed $60 per ton. That kind of rock counts, even in working in a small way. The owners are now making an opening in a new place on the ledge, where they have reason to expect some rich developments. It is to be regretted that some company does not own this mine with the necessary capital to erect proper machinery, for it would make a showing that would not only be good for the owners, but of vast benefit to the whole county. The Hallsted mine is only one location of a dozen, any one of which, if properly developed, would be a bonanza.

THE UNION.—A gentleman who was over in the Gibsonville country last week, gives a good account of this mine, which is again paying splendidly. He saw an oyster can full of beautiful gold, the result of one week's work by five men. It is reported that $3,000 was taken from one car-load recently.

LUCKY S.—The work of putting up a mill on this ledge is being prosecuted as rapidly as possible. The Greenville Foundry has the contract for the castings, and will soon have them completed. Mr. Dorsh, of this place, is making 600 feet of iron pipe, which will convey water to the wheel under a pressure of 160 ft. Five stamps will be put in at once, and five more as soon as the managers think best. It is expected that the mill will be in running order some time in September.

RUNNING NICELY.—The Leavitt & Loring mine at Elizabethtown is paying well, and everything is in good running order. The pump handles the water easily, and no trouble is had on that score. The dump, water-tank, washing flume, and all the working arrangements are built with a view to economy, and the owners now feel that they have a mining property which will bring them a fortune. No very coarse gold has been obtained so far, but pieces weighing from five to ten dollars are not uncommon. Some fifteen or twenty men are employed at the mine.

Shasta.

LOOKING WELL.—Shasta *Courier*, Aug. 23: The Mammoth mine at Old Diggings is looking splendidly, and Frank Yung writes that the Little Central is looking even better than the Mammoth. The new shaft in the Little Central ledge is down 18 ft. Over 200 tons of quartz are now out of the Mammoth and Little Central claims, and the ore is very rich, estimated at over $200 to the ton, and there are thousands of tons in sight and easily extracted.

San Bernardino.

IMPORTANT MINING OPERATIONS.—Calico *Print*, Aug. 23: Last week Mrs. A. K. Townsend returned to Calico from San Francisco, where she had been for three or four months, and returned the following day to the city. Last Wednesday she again came down from the city and went back yesterday accompanied by Ed. Gibson, who has been employed in developing some of her mines. Mrs. Townsend has for some time been trying to get capitalists to invest in her mining property, and has finally succeeded after overcoming obstacles that would have baffled many less resolute and enterprising operators in mining matters. She has bought out all her partners' interests in the Alhambra, Golconda, and two Vicksburg mines in East Calico, and transferred one half of the same to a rich firm in San Francisco, who will immediately proceed to put up a stamp mill near Calico, and will put on a large force of men to develop the above mines. Mr. Gibson's trip to San Francisco is for the purpose of returning with machinery to bore a well on the proposed mill-site.

Siskiyou.

SAWYER'S BAR.—Cor. Yreka *Union*, August 23: Messrs. Klein & Moore, who own the Deep Channel claim, situated on the river below Mohr & Co.'s claim, will be ready to commence sinking in a few days. They have been to considerable expense in rigging up their claim and bringing on water. The claim is quite deep and difficult to work, but it is thought that there is big pay convenient to the bedrock. We hope the parties may be suitably rewarded for their enterprise and industry. William Burns has finished washing up his ground sluice, and it is supposed with the usual satisfactory results. It is rumored that Mr. Benton, who has resided on Russian creek, near its confluence with the North Fork, has, in the past few days, struck it rich, having taken out 80 ounces in one week, and has taken out altogether two thousand dollars. Mr. Benton has worked near that place for about eight years, and for most of the time, has been alone. The Mohr & Co. and the Rundel & Barry claims are in full blast and doing well.

PICK AND PAN.—Yreka *Union*, August 23: From 21 tons of rock, Brown & Co., of French Gulch, realized $1,071, an average of $51 per ton. Schroder & Co., at the head of the East Fork of Deadwood, have discovered the richest vein of quartz ever struck in this county. There are pieces of rock in the dump that are probably the size of an ordinary satchel, and the gold in them is as thickly interwoven as moss. The owners will wager any amount that two hundred dollars can be pounded from any one of the pieces referred to. From a bucket of decomposed rock, $25 has been realized. The vein, 75 feet in is 15 feet wide, well defined, and every pound of it pays. The owners, without croppings or other signs to guide them, other than the appearance of the country, commenced prospecting for the ledge a year ago with the success above noted.

NEVADA.

Washoe District.

HALE AND NORCROSS.—The northwest drift on the 2800 level was yesterday out about 40 ft. The face was showing a considerable amount of quartz of good grain and appearance, but carrying very little metal. This drift is not now following the diamond drill hole. It has been directed more to the northward, and it is the intention to push it through to the Savage south line. A west cross-cut will presently be made from it to the ore deposit first found, or rather to a point a short distance north of that ore body. This cross-cut will require to be but about 30 ft in length. The usual amount of ore is being extracted on the 200 level.

SIERRA NEVADA.—Are repairing the drift on the 2300 level through which passes the compressed air pipe. On the 3200 level the joint Sierra Nevada, Union Con., Ophir and Mexican winze has been sunk and timbered 8 ft. Since last report a considerable amount of porphyry has made its appearance in the bottom of the winze. This porphyry has crowded out the bastard quartz, and in turn will probably give place to genuine and fertile quartz.

ALTA AND BENTON.—The west drift on the 2150 level continue in quartz of a good quality, which carries some metal. The branch drift into the Benton ground is in quartz of about the same kind. A second diamond drill hole was yesterday started from the face of the east drift. This will be a two inch hole, and will materially hasten the draining out of the ground lying to the east.

BEST AND BELCHER.—The west drift on the 2500 level is out about 565 ft and is in soft and favorable vein porphyry. The drift has yet about 100 ft to go to get under the point where quartz and a good prospect were found above. The north drift from the 825 station of the Bonner shaft is out about 300 ft and is in vein porphyry with some seams of clay and stringers of quartz.

OPHIR.—On the 250 level are taking out fillings. On the 500 level the west drift has been extended 70 feet. The joint Sierra Nevada, Mexican and Union Con. winze below the 3200 level has been sunk and timbered 8 ft. The bottom is showing a preponderance of porphyry; over the bastard quartz so long forming the principal material in the winze.

UNION CON.—On the 3200 level the joint Mexican, Ophir and Sierra Nevada winze has been sunk and timbered 8 ft. It is now down about 82 ft. Porphyry predominates at the bottom. Below this porphyry the fertile quartz lying to the west above is expected to make its appearance.

MEXICAN.—The joint Ophir, Sierra Nevada and Union Con. winze below the 3200 level has been sunk and timbered 8 ft. The usual vein porphyry is taking the place of the bastard quartz which has heretofore been the predominant material at the bottom of the winze.

CHOLLAR.—The west cross-cut from the main south lateral drift on the 2800 level is still being advanced in a solid body of quartz of good appearance and which carries a small amount of metal. The ground continues dry.

YELLOW JACKET.—Work in this mine is going on about as usual, and an amount of ore sufficient to keep the mills on the river running to their full capacity is being extracted. The usual amount of prospecting is being done.

UTAH.—The material encounter in the southeast drift on the 1950 level continues soft and favorable. There is no water to interfere.

ALPHA.—The north drift continues in quartz carrying a small amount of metal.

ANDES.—The prospecting drifts are encountering quartz of a favorable appearance, and about the usual amount of low grade ore is being found.

CROWN POINT.—All work is going on about as usual. Sufficient low-grade ore is being extracted to keep the river mills in full and constant operation.

SCORPION.—The usual progress is being made in the north drift on the 500 level, and the material remains about the same as heretofore.

BELCHER.—The usual quantity and quality of ore is being taken out on the old upper levels and sent to the mills on the Carson river.

CON. VIRGINIA AND CALIFORNIA.—Drifting on the 2900 level is, about to be resumed. The holes thus far have shown very wet ground.

Belmont District.

BELMONT. *Courier*, Aug. 23: Stope No. 1 has improved very much. It is opened 50 ft in length with fine ore 3 to 6 ft in thickness. Stope No. 4 and understopes 1 and 2 all holding their size and yielding splendid ore. Mill doing excellent work, except has been shut down five days on account of broken cam shaft. Will start up again to-night. Shipped $4,000 in bullion. Hereafter regular shipments will be made for months to come.

Bullion District.

THE BULLION MINES.—Virginia *Enterprise*, August 21: A new bullion-producer is the district twenty miler east of Beowawe, where Fred. Hutchins and Charley Stoddard had some claims a couple of years ago. The Silverside ships to Salt Lake, and the Lady of the Lake has a mill. Dr. Frisbie, of Vallejo, is the principal owner in the Lady of the Lake. It has shipped $20,000 this summer, and has a good body of ore. It is down only 100 feet. Grayson & Benson own the Riverside. The ore goes from $80 to $1,000 per ton, and is free milling. It ships about $3,000 to a car-load, and averages a car-load a month. It is down seventy feet, with a tunnel 300 feet long.

Cortez District.

A GOOD MINE.—Reno *Gazette*, August 21: Mr. Newban's mine at Cortez is looking better than ever. He shipped last week twelve bars of bullion, worth about $1,100 each, and he ships something every month. He has plenty of good ore in sight. He thinks the mine will last a life-time. He is laying a two-inch iron pipe to bring water eight miles, and will build a mill near the mine. He now hauls the ore eight miles to his mill.

Jersey District.

LOCATED.—*Silver State*, August 21: Several mining claims have recently been located in Jersey District, which is located in the southeastern part of this county near the Lander line. Some years ago there was quite a rush to the district, and one of the mines, which was worked to some extent, produced considerable base bullion. The ores then worked carried a high percentage of galena, and were smelted.

Sacramento District.

THE HUMBOLDT QUEEN.—*Silver State*, Aug. 21: An important strike has been made on the Humboldt Queen mine, near Rye Patch. Reports from reliable sources are to the effect that a large body of very rich ore has been found in the mine at a depth of 125 ft from the surface. The strike is said to be the most important ever made in Sacramento district. The extent of the ore body is not yet known.

Taylor District.

MINERAL RESOURCE. Cor. Pioche *Record*, Aug. 20: After a close inspection of the mineral resources of Taylor, I am of the opinion that the camp is coming to the front at no distant day as a large bullion producer. Both the Monitor and Argus companies are extracting a very fine character of high-grade ore, besides doing considerable prospecting in both the mines. The Augus mill, at present undergoing repairs, will be able to start in a few days, when a long and prosperous run will be made. The ore in the Monitor lies flat, and in oblong chambers, some of which are 100 ft in length by 30 in width, between quartzite and lime, with a streak of porphyry occasionally on the footwall. The hanging wall is quartzite. The richest ore is found in a hard slate, liberally streaked with black metal and chloride of silver, and assays from $150 up to $1,500. The ore at present being extracted averages $120 per ton. The ore in the mine was first discovered under grass roots, and has been persistently followed ever since, which policy is being successfully carried out to-day. The fortunate owners of this little bonanza are Robert Briggs, W. G. Lyons and W. N. McGill, all practical miners, and they have realized during the past two years, that is from the 1st of September, 1881, to the 14th day of July, 1884, the snug little sum of $361,000, with a whim for hoisting works. There are several other mining claims in and around camp that only need a little muscle, backed up with small capital, to make them paying properties, for there is most assuredly a rich mineral belt running through this section. Taking it all in all Taylor is a promising camp, and the citizens of the county owe a debt of gratitude to the few enterprising men who unaided by capital have done more toward establishing legitimate mining than any corporation in the State.

Tuscarora District.

NORTH BELLE ISLE.—The usual progress has been made with the work on the 70-ft level. Have started a cross-cut east 30 ft from the face of the main drift north.

BELLE ISLE.—North drift, on the east vein 150-ft level, has been advanced 8 ft. The vein is of a fair width for high grade.

NAVAJO.—Drift south from joint Belle Isle and Navajoline cross-cut has been extended 11 ft. The ledge and pay ore is the full width of the drift. Good progress is being made with the work at all other points.

GRAND PRIZE.—Stopes above the 400 have improved in the last few days, and are now yielding some very good ore. Mill is running all right.

ARIZONA.

EMERALD.—Tombstone *Epitaph*, Aug. 23: The Emerald mine now presents a busy scene. Several new buildings are going up, the principal one being the new hoisting works. The gallows frame is erected. The machinery, formerly on the Sunset mine, is in place, and will be ready to start up by the 1st of September. A large force of men are employed in the mine and on top, and the indications are that it will be worked for all there is in it.

A GOOD MINE WELL WORKED.—Prescott *Courier*, Aug. 23: The Lane mine, which was purchased some months since by the company represented by Mr. T. J. Eaman, has, under his able supervision, an exceptionally fine record as a bullion producer. A four-stamp mill was started on the ore from this mine on the 12th of June. In two months from date of starting 300 tons of ore were crushed, which paid between $50,000 and $60,000. From August 1st to the 19th the net bullion product has been $26,000. The mine has paid the original purchase money—all running expenses. There are on hand three months' supplies of material and the surface only has been broached, so to speak. The mine is undoubtedly a good one, and Mr. Eaman is one of the few millmen who know just exactly how to profitably work such a bonanza.

BRADSHAW.—Cor. Prescott *Courier*, Aug. 23 Although we receive but very little notice from the press, yet there is considerable mining carried on here, perhaps more extensively than at many other mining camps. Brittingham, Bond and Hayden are making preparations for starting the Bradshaw Basin mill on ore from their mine. This mine is by far the best mine in this neighborhood. They have on the dump 500 tons of ore which will mill $100 per ton, and as the mine is well opened up and prospected plenty more ore can easily be extracted. We often hear it said that a person can sell a good mine any time, but that this assertion is not always strictly true is demonstrated when it is well known that this is a good mine. An offer of $18,000 was made, but refused by the owners, for the entire ore and mine. I think no sane man would accept such an offer for 500 tons of $100 ore and the mine in the bargain. As they had no chance to dispose of their ore and mine to advantage they have leased the Basin mill for the reduction of the ore. Mr. Riggs, the well-known old-timer, is taking out good ore from the Tiger. The ore is being taken from drifts run on the old shaft. This shaft was sunk in '71, under the superintendence of Mr. Riggs. He will find plenty of good ore yet in the old Tiger, no doubt. The water is forced out of the shaft with a syphon. This mine, with proper management, similar to the excellent management the Tip Top mine had, would have been a bullion producer these past three years, since it has been lying idle. At the Del Pasco quite a number of miners are prospecting their respective claims and taking out some good gold ore since the Del Pasco mill started operation, and all seem to be well satisfied with the fruits of their labor. The Lane mine continues to turn out high-grade ore which is being reduced at the Tuscumbia mill. I have been informed that an additional force of miners have been employed, which is evident that they have "struck" it better than ever.

MOHAVE.—*Miner*, Aug. 21: Ewing & Goshorn have just shipped twelve tons of ore from the Atlanta mine at Chloride. Wm. McCue was over from the Black and Tan mine last Wednesday and reports everything looking well at that mine. He and his partners are drifting on the ledge and have a good streak of pay ore, with assays running from 45 to 225 ounces to the ton. J. J. Hyde shipped a car-load of ore from the Standby mine to the Benson smelter last week. The concentrators at the New London mine are working to perfection, and all low-grade galena and screenings, etc., are now concentrated and then shipped to the Benson smelter. Superintendent Raymond, of the Champion mine, is having some large tanks built preparatory to putting in some concentrators similar to those on the New London mine.

NEW CANNON BALL MILL.—Tucson *Star*, Aug. 20: The Dyer cannon ball mill now in process of erection on the Galdtree and Schultz mine on the San Pedro will be completed and in operation in about ten days. If this mill is a success, a second, and later on a third mill will be put up. The present mill has a guaranteed capacity of 12 tons per day. The frame-work for the second mill is already being built. The ore is rich in free gold, and as there is an abundance of it, it will no doubt prove a bonanza to its fortunate owners.

COLORADO.

GENERAL NOTES.—Colorado *Miner*, August 21: A mill run from the Multum in Parvo lode, gave returns of 236 ounces silver per ton. John Hite & Co. have a small streak of good ore in the Glendower lode on Columbia mountain. Messrs. Hamilton and Willets have taken a lease on the Silver Belt lode on Leavenworth mountain. A late mill run from the Joe Reynolds' No. 1 gave 246 and 146 ounces silver per ton, according to class. The Bismark lode on Sherman mountain is being worked by several parties of lessees with remunerative results. The Echo shows a good vein of ore, which mills 340 ounces silver. Mr. William J. Mitchell is superintendent, Ed. Jones & Co. have taken a lease on the Centennial lode. This mine is reported as looking exceedingly well at present. A mill run from Hugh Behan & Co.'s lease on the Joe Reynolds' lode, Monday, gave 287 ounces first class and 186 ounces second class. Henry Parker & Co. have been leasing on the Hidden Treasure lode, at Empire, for some weeks. This vein carries horn silver, and gives promise of becoming a very valuable lode. The Forrest Rose shows a good streak of quartz, scattered through with mineral, which, unassorted, mills 100 ounces silver; and, assorted, runs 430 ounces. One small streak, one and a half inches wide, shows solid ruby. The Fulton lode, on Sherman mountain, still continues a steady producer. Twelve tons of ore were shipped from this mine last Tuesday. Reports from the Mendota are to the effect that the mine is still improving as development progresses. Next week there will be large shipments of ore. A company has been formed in St. Louis on the Homestretch, Forrest Rose, and Echo lodes, located at Williams Fork district. The first named lode shows about one inch of solid ore carrying ruby silver, silver glance, gray copper and native silver, which mills one ounce in gold and 116 ounces silver. A valuable strike was made in the Victoria tunnel this week. It is not definitely known, as yet, what lode it is, but, in all probability, it is the Mendota. Two inches of solid mineral was encountered last Thursday evening, and since then they have opened out about eighteen inches. The lode struck has a perceptible dip, and is about seventeen feet between walls.

IDAHO.

GOLCONDA.—Idaho *Statesman*, Aug. 16: Mr. James Monroe, of the Golconda mine, Boise county, was in the city yesterday. He says that he has his 5-stamp mill running on good ore, crushing at the rate of ten tons per day. He has not yet made a general clean-up, but the yield from the plates indicate satisfactory results. Mr. Monroe is well acquainted with the Banner property, and says that he considers the prospects of that camp the best of any in the Territory. In the Banner mine there is good ore enough already developed and in sight to keep the 20-stamp mill running constantly for two years, while the indications for a continuation of the rich vein are as good as when first discovered.

THE BASIN.—Cor. Idaho *Statesman*, Aug. 19: There is very little placer mining going on at present in the Basin, the season being about over. At Pioneerville, work is being vigorously pushed at the placer claim of Ben Willson. The mines in this part of the Basin have all yielded well this season, and are far from being worked out. The Gold Hill mine has suspended all work, for the present at least. Nothing will be definitely known until the arrival of Mr. Mootry, one of the owners. Messrs. Dave and William Coughanour, two of the principal owners of the mine, do not feel disposed to sink any farther at present. This it will be necessary to do before much can be accomplished, as the ground is pretty well worked out down to the 400-ft level. In company with Mr. W. H. Davidson we visited Quartzburg and the mine. They had just finished taking out the pump. The mill is full of ore, which will be crushed in probably three weeks. A cannon-ball mill passed through this place the other day, to be used in crushing ore from the Centennial mine, there being now about 200 tons on the dump. Through a kind invitation from Mr. W. G. Harden, we paid a visit to the Centennial and the Belshazzar mines, in both of which Mr. Harden is one of the principal owners. The Belshazzar has about 200 tons on the dump, most of which will assay well. The ledge is 15 ft wide, and a large portion of it is uncovered, it is no doubt a valuable property.

IDAHO CITY.—The Elmira Company at Banner have started up their mill and the first two bricks for this season came down to Idaho City while we were there. The weight was about 100 pounds and value about $1,500. They expect to turn out $1,000 a day all summer. James Monroe has started his 5-stamp mill and made a good run, and brought the bullion down to the assay office in this city last week. K. P. Plowman has not cleaned up his placer run, but will in a few days. He, as well as others who know the ground he has moved, anticipate he will have the largest yield his mine has ever made. The amount is put at from $50,000 to $75,000. Channel & Co., on Willow Creek, have had an excellent run, but have not cleaned up, and Ben Wilson, at Pioneer, has made a heavy run this year, and Doc Noble, farther up Grimes Creek, has made a good run. Mr. James Moriarity, Wells, Fargo & Co.'s agent, and Mr. Church, cashier of the Boise County Bank, who handle most of the bullion and gold dust, and who know best about the product of the mines, told us the yield would be largely in excess of any year for some time past. The shutting down of the Gold Hill mill is supposed to be temporary, but whether it is or no, the mines are improving in Boise county, and business correspondingly so.

NARROW GAUGE GULCH.—Wood River *Times*, August 21: Superintendent James A. Wilson, of the Narrow Gauge and Bannack group of mines, was in town to-day. He reports everything working satisfactorily up in Narrow Gauge gulch. His concentrating works have just run through a 20-ton lot of ore from the French Boys' group, but the result is not yet known. If satisfactory, it will be a God-send to the French Boys, as they have a mountain of ore, but of low grade. Two good strikes have recently been made in one of the side gulches off of Narrow Gauge gulch, and in the Narrow Gauges they are driving toward an ore-chute, with every prospect of striking ore soon.

MONTANA.

ITEMS FROM THE MINES.—Butte *Miner*, Aug. 20: This report concerns only mines on the west side of the city of Butte. The mines west of Missoula Gulch and being worked now, are, for the most part, in the Manganese belt. Most of them could not be worked profitably a few years ago, when they were located on account of a lack of facilities for reducing the ore, and because so much of it was low-grade. But now the smelters pay a good price for it, because they need the manganese in the reduction of other ores. These mines are as yet hardly anything more than prospects.

THE STEVENS.—A controlling interest in this mine was bought some time ago by Judge A. J. Davis, and work began on June 19th; a pump was started to work. Saturday night a force of hands was put on to begin the work of cleaning out the levels and getting the mine in shape for work.

THE SATURN.—This lode is almost directly west of the Stevens, and across the Missoula gulch. It is being worked now on a lease by Sorenson and Baker. They are down on the shaft 30 ft. The vein is five feet wide and the pay streak varies from six inches to one foot. They have been selling the ore to the Colorado smelter and it has averaged 200 ounces.

THE STAR WEST.—This lead is northwest of and close to the Dexter mine and has been lying idle for a year or more. It has recently been leased by Hoar Bros. & Co., who have lately quit work on the Andy Johnson. This company have moved the boiler and hoisting machinery from the Mountain Boy and are preparing to go to work in earnest in the lead.

THE PLACER LODE.—This property belongs to Mr. Wayne Bernard and is now being worked by Messrs. Vineyard, Sorenson & Hutchinson, who have leased it for a year. There is a shaft on this lead fifty ft deep worked with a windlass, from which lessees, have within the last few months, taken forty tons of ore running from seventy to one hundred and ten ounces.

THE CZARINA.—Owned by C. W. Farlin, southwest of Butte, has a 30-ft shaft from which some good ore has been taken. Woodmanse & Co. have a lease of 400 ft on the west end of the Czarina. They are working in a forty foot shaft, and have run a short level east and west. On Saturday they made a rich strike showing 200 ounce ore.

MAPLETON.—This lead is owned by Foster, Rosenthal and the Harvey McKinstry estate. Mathews & Co. have a lease on the east end of the claim. They are working in a 27-ft shaft. Near the surface they made a rich strike, but lower down the lead dipped north. On the west end of the Mapleton, King & Co. have a lease. They have just begun work in an old 30-ft shaft. At that depth the vein is nine ft wide and runs 35 ounces in silver and 59 per cent manganese. Southwest from the Mapleton is the Washington Lady, leased for two years by Peiler & Blandino. The shaft is being sunk so as to strike the lead about 50 ft below the surface. The Burlington is being worked on a lease by Master & Co. They have lately begun work in an old 60-ft shaft and have been running levels east and west at that depth. The Fredonia, leased by Buzzo & Co. They have a shaft of 160 ft worked by a windlass. They are working in the stopes at the 50-ft levels and are taking out ore that runs 20 ounces silver and 70 per cent manganese.

A NEW MILL.—*Inter Mountain*, August 21 A long-pending negotiation, Messrs. Stonebreaker, Laws, and other Baltimore capitalists on one side, and Patrick O'Donnell on the other, was brought to a successful conclusion to-day through the efforts of Messrs. Hammer & Nesbitt, of Butte, with reference to the Marget Ann mine. The property is developed by a shaft 80 feet deep, from which two levels have been extended, exposing in both the east and west drifts a fine and compact ore body having an average width of four feet of pay rock, though the ledge itself is much wider. The claim contains two ledges, but only one of them has been developed to any considerable extent. What ore has thus far been produced was treated at the Silver Bow mill, where its average pulp assay was 46 ounces in silver. The terms of the transaction are, that in consideration of a deed for a one-half interest in the property, the Baltimore men agree to build and equip a 15-stamp mill, the whole to be afterwards capitalized, and the stock equally divided between the parties to the deal. The contract for the erection of the mill was let to day to Tuttle & Co., of this city, and the work of construction will at once begin before late in the fall. It is designed by the company to abandon temporarily the old workings of the mine, and to start a new shaft without delay.

MADISON COUNTY.—*Inter-Mountain*, August 21: We understand that the Alder Gulch C. M. company are about to try the experiment of working the black sand tailings from their flume in the mill of the Virginia City Reduction company. The result will be watched with interest by placer mine owners. The Ramshorn mining district is one of the promising localities that bid fair to become a leading center of mining industry in Madison county. Considerable work is being done in the leads of that section, and some new prospects have been discovered that promised to be very valuable. It is reported that the Pacific mine, in Brown's gulch, will be purchased by Mr. F. J. P. Pascoe, who has been here some time looking after his quartz interests in Madison county, and viewing the country in behalf of Utah capitalists. He has been spending some time in the Brown's gulch district, and expresses a high opinion of several of the quartz lodes there. It is understood that, in the event of purchase, Mr. Pascoe intends building a smelter on one of the neighboring creeks at an early day. In the Meadow Creek mining district, Martin Peel is building an arastra, and the claim owners are starting in to prospect and develop their mines. Richter & Co. are tunneling the Grand Central, and others are preparing to thoroughly test the extent and value of their property. Roads will be built to the mines, so as to make them accessible next winter.

NEW MEXICO.

GOLD GULCH.—Cor. Silver City *Enterprise*, Aug. 15: Considering the warm weather, there is much being done towards illustrating the fact that this camp abounds in silver. Almost every claim is being worked and everybody is looking as if they expected to become Goulds and Vanderbilts. The Sam Augustine mine is being worked by two shifts. The owners of the Young Man mine are pushing forward development work as fast as possible for them to do so. They propose in a short time to put on a force of men to the number of about twenty-five, to get out ore for shipping purposes. Work is being done in three places, and in every place so developed there are showings of native chloride, bromide and ruby silver. J. B. Malone, from whom the camp takes its name, is sinking on the Donohoe claim, and is taking out rock averaging $200 per ton.

CANYON CITY.—*Enterprise*, Aug. 21: Canyon City is the name given to the camp at the Cooney mine, about 8 miles from Alma on Mineral creek. The town is well named as it is located in one of the deepest and grandest canyons in New Mexico. The camp has been established several years, but until within the last few weeks has shown no building activity to speak of. Since the Cooney mine is turning out so handsomely and the probability that the company will erect extensive works, the camp seems to have taken a new lease of life and buildings are springing up as if by magic.

UTAH.

REVIEW.—*Tribune*, Aug. 22: The week has been one of fair activity in the metals. It has been cool, and rather stormy. The receipts of bullion and ore in Salt Lake City for the week ending August 20th, inclusive, were as follows: Bullion, $130,588.69; ore, $9,300; total, $139,888,69. For the previous week the receipts were $113,705.42 of bullion and $11,000 of ore. The Crescent shipped in three lots of ore valued at $9,300. Its improvements are making now with vigor, to prepare for safe and convenient handling of ore when the winter weather comes. The Tintic M. & M. Co. have again resumed shipments, we are glad to say. The result this week is two bars, of the value of $55,000. The product of the Hanauer smelter for the week was eleven cars of bullion, $16,015.

WASHINGTON TERRITORY.

RICH STRIKE.—*Kittitas Localizer*, Aug. 21: Various rumors have been set afloat as to valuable discoveries having been made in the Cle-el-um mining district. The Centennial and the Bullion lodes have both been highly prized, and are still favorites among the claimant; but the task of unearthing the mother-lode seems to have been reserved for Henry Livingston and F. D. Schneby to make. The evidence of this is found in the specimens of half galena and silver quartz they brought down several days ago from the Cle-el-um mining district. No assays of this valuable mine have yet been received. A number of the disappointed men who flocked to the Conrd'Alene mines last spring have turned up in the Similkameen mines—dead-broke of course. The output of coal in the Cle-el-um mines since the coal has been introduced into this valley is largely increasing. The blacksmiths are arranging for a winter's supply; and coal stoves are now talked of in which to utilize it for warming purposes.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Glant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

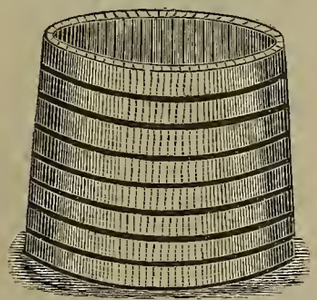
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

WATER TANKS.



Our well-known Water Tanks are made by machinery, from the best of materials, and shipped to all parts of the country. Each piece numbered. No skill required in setting up.

Chicago Prices Beaten!
ESTABLISHED 1860.
S. F. PIONEER SCREEN WORKS,
32 Fremont St., San Francisco.
J. W. QUICK, Prop'r.

Sheet Metals of all kinds perforated for Flour and Rice Mills, Grain and Malt Driers, Furnaces, Chess, Cement and Smut Mills, Separators, Revolving and Shot Screens, Stamp Batteries, and all kinds of Mining and Milling Machinery. Inventor and manufacturer of the Celebrated Slot Cut and Slot Punched Screens. Mining Screens a Specialty, from No. 1 to 15 (line).

☞Orders Promptly Executed.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG. } **Dewey & Co.'s Scientific Press Patent Agency** { ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Metallurgy and Ores.

SELBY
SMELTING and LEAD CO,
416 Montgomery St., San Francisco.

Gold and Silver Refinery And Assay Office.

HIGHEST PRICES PAID FOR
Gold Silver and Lead Ores and Sulphurets.

Manufacturers of Bluestone.
ALSO, LEAD PIPE, SHEET LEAD, SHOT, ETC.
This Company has the best facilities on the Coast for working
GOLD, SILVER and LEAD
IN THEIR VARIOUS FORMS.
PRENTISS SELBY, - - Superintendent

Nevada Metallurgical Works.
NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.
C. A. LUCKHARDT, Manager. ESTABLISHED 1869.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
Assayers' Materials,
MINE AND MILL SUPPLIES,
CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.
118 and 120 Market Street and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

JOHN TAYLOR & CO.

J. KUSTEL. H. KUSTEL.
METALLURGICAL WORKS,
318 Pine St. (Basement),
Corner of Leidesdorff Street, · · SAN FRANCISCO.

Ores Sampled and Assayed, and Tests made by any Process.
Assaying and Analysis of Ores, Minerals and Waters.
Mines Examined and Reported on.
Practical Instruction given in Treating Ores by approved processes.

G. KUSTEL & CO.,
Mining Engineers and Metallurgists.

614 to 618 Battery St., San Francisco.

MICA, MINERALS, PRECIOUS STONES.

RICHARD BAKER & CO., General Produce Brokers, No. 9 Mincing Lane, LONDON, England. Advances made on Consignments. REPORTS GRATIS ON NEW PRODUCTS. Bankers: AGRA BANK, LONDON.

Mining Share Market.

The market has been rather slow during the past week, though in some cases fluctuations have been somewhat marked. On the Comstock the deep winze below the 3200 in Mexican has yet about 18 feet to reach the 3300 level. Porphyry is taking the place of the bastard quartz heretofore predominant in this winze. Below this quartz it is expected will be found the genuine and fertile quartz that was seen to the west on the levels above. To reach this, however, it will be necessary to cross-cut west on the 3300 level. The west drift on the 500 level of the Ophir is now being pushed ahead at the rate of about 70 feet per week. The drift will tap ground in the old upper levels that is expected to yield a large amount of low-grade ore. The west drift on the 2800 level of the Chollar still continues in quartz that is of good appearance and which carries some metal. The great body of quartz found in this mine and in the Hale and Norcross is a most encouraging feature. Quartz is the mother of gold and silver, and the larger the body the larger the bonanza. There is no hope of a larger body of ore on a little starved quartz stringer.

Bullion Shipments.

Reed & Hillary, August 23, $2,800; Old Henry, 23, $1,500; Placer, 23, $600; Bismark, 23, $6,549; Cuba, 23, $2,600; Bonanza King, 23, $11,250; Argus, 16, $5,471; Monitor, 15, $13,782; Horn Silver, 20, $12,000; Hanauer, 20, $3,400; Stormont, 20, $3,000; Horn Silver, 21, $12,000; Ontario, 21, $9,114; Horn Silver, 22, $6,000; Ontario, 22, $2,895; Hanauer, 23, $5,200; Crescent, 23, $3,700; Horn Silver, 23, $12,000; Ontario, 23, $8,691. The banks of Salt Lake City report the receipts for the week ending August 20th, inclusive, of $130,588.69 in bullion and $9,300 in ore; a total of $139,888.69.

Secure the Reduced Rate.

After the first of April, 1884, we announced a reduction of the price of the MINING AND SCIENTIFIC PRESS from $4 to $3 a year to all who would settle up arrearages at old rates and pay *in advance* thereafter. There are some who have not yet taken advantage of this offer, and we would therefore urge all subscribers still in arrears to remit what is due us to this date, at the rate of $4 a year, and pay in advance for another term at the reduced rates for new subscriptions paid in advance.

OPTICAL SCIENCE.—Physiological optics, a progressive science, constantly presents new problems to scientists. Spectacles were originally made up in sets for fixed ages, and specific power, named after the manufacturer; later on they were numbered by inches; and now superseded by the metrical system divided in dioptrics, the result is much more accurate, and mathematical precision also gradually depriving those who merely engage in the sale of glasses as an article of merchandise, from finding it a profitable investment to be obtained from practical and scientific oculists and opticians. Spectacle lenses undoubtedly formed the basis for the telescope and microscope, and physiological dioptrics, as optical instruments, highly valued by men of science.—C. MÜLLER, Optician. 6

MR. G. W. INGALLS is at present representing this paper in Arizona. We hope that our friends and others who desire to give as much publicity as possible to the resources of that Territory will aid him as much as they can in gathering information. Mr. Ingalls is authorized to receive subscriptions and advertisements.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING AUGUST 19, 1884.

303,693.—AMALGAMATING PAN—J. A. Bidwell, Ivanpah, Cal.

303,696.—BILLIARD TABLE LEVELER—J. W. Blundon, Whatcom, W. T.

303,698.—CAR COUPLING—L. A. Branchaud, S. F.

303,811.—WAGON JACK AND TIRE TIGHTENER—W. W. Coon, Walla Walla, W. T.

303,713.—SAFETY CAR TRUCK—J. Denechaud, Sr., S. F.

303,715.—REVERSIBLE PLOW—A. H. Fitch, Santa Cruz.

303,723.—HAND PIECE FOR DENTAL ENGINES—Grace & Miller, S. F.

303,734.—GRAIN SCOURER—John C. Hunt, Chico, Cal.

303,738.—TWO WHEELED VEHICLE—F. A. Knox, Woodland, Cal.

303,654.—WINDOW BEAD FASTENER—D. C. McGregor, East Oakland, Cal.

303,742.—MOP-WRINGER—W. F. Mills, Oakland, Cal.

303,761.—MECHANISM FOR BALANCING AND SUPPORTING MILLSTONES—Geo. Simmerlon, S. F.

303,780.—REVOLVING HARROW—J. D. Winters, Davisville, Cal.

NOTE. Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PIPE, JOINT AND COUPLING.—John C. Kittou, S. F., assignor of one-half to J. O. B. Gunn. No. 402,343. Dated July 22, 1884. This pipe joint and coupling is specially useful where gases or vapors are to be conveyed under pressure. It consists of a coupling-sleeve having screw threads cut at one or both ends, and a permanent collar or collars formed within the sleeve, just inside the screw threads, secured by glands or followers which surround the pipes and screw into the sleeves. The pipes may have a collar and packing, against which the sleeve presses to hold them and make a tight joint, or the outer end of the gland may be conical-split, and threaded to receive a nut which closes it, so as to clamp and hold the pipe. In coupling pipes for ice-machines or other places where gas or vapor is passed through them under high pressure, it has been customary to cut a thread upon the exterior of the pipe end, and screw it into a coupling nut with packing to make the joint tight. This plan is open to the objection that the pipe is much weakened by cutting the screw thread and is liable to be ruptured at that point. The new form of coupling obviates this difficulty.

CONSTRUCTION OF BUILDINGS.—Peter H. Jackson, S. F. No. 302,338. Dated July 22, 1884. This consists of a novel arrangement and construction of parts, to accommodate the different constructions in front of a building. In making buildings it is often necessary to illuminate certain portions of the basement or vault formed underneath the sidewalk by glazed portions of the same, while other portions are supported by brick arches. Mr. Jackson has the beam-riser forming the offset between the cover of the area way and the sidewalk, with outwardly projecting flanges at the bottom to support a sidewalk, the said riser having a vertical web of different depths, so that illuminating tile or brick arches may be supported from the flanges and the surfaces be level or continuous. He also combines with the beam-riser a supplemental beam support extending parallel with and behind the riser, and having intermedial connecting and supporting brackets. Compression rods extend back from the beam or riser to the floor timbers.

HAND BLOWER.—George Cumming, S. F. No. 301,967. Dated July 15, 1884. It consists in the application of toothed gearing from the crank shaft, or point of application of the power employed through a train of toothed gear wheels to the shaft which carries the fan of the collection, and casing in of all the working parts of the apparatus, so that they are not exposed or widely separated; in a pin and means for keeping the casing, holding the gears in its proper place, and of steel buttons on the ends or extremities of the bearings of the gear spindles, in order to keep the gears in their proper longitudinal position, and take up end-play. Hand blowers now in general use are driven by a crank or lever; but before the power is applied to the shaft carrying the fan; it is transmitted through belts, bands, woven or friction gears, the fan and its casing being capable of separation from the rest of the parts of the blower. The driving apparatus being connected by belts, bands, etc., is likewise separated, and also exposed. In Mr. Cumming's invention, the fan and driving mechanism are contained in a case of peculiar construction, all the driving parts being protected without interfering with the free ingress of air to the fan.

STEAM ENGINE.—John P. Pritchford, S. F. No. 302,636. Dated July 29, 1884. This invention relates to certain improvements in that class of steam engines having independent rotary steam and exhaust valves, and it consists of certain improvements in the rotary valves and the parts by which the steam is admitted to the cylinder and exhausted therefrom, of a means for driving said valves, and of certain improvements in the cylinder and cylinder-heads within which the valves operate, and the steam and exhaust passages. In large engines the amount of machine work upon the cylinder is a matter of considerable expense; but on the engine the most of this work is done upon the heads, which, being comparatively small, are more easily handled, and from their shape are more easily adapted to machines which will do the required work. If a valve becomes deranged or needs repairs, it may easily be removed without disturbing the remainder of the machinery, or it can be disengaged from the ditch device which forms part of the invention.

SHEEP SHEARS.—S. D. Paxton, D. E. Paxton and Amos Mahurin, Usiah, Meudocino Co. No. 302,354. Dated July 22, 1884. The invention is in that class of sheep shears in which the blades are held apart under the influence of a spring, against which the pressure of the hand is exerted to close them. It consists in a novel hinge-connection between the shanks and blades; in a peculiar spring, under the influence of which the blades are opened; in a stop or catch which limits their separation when operating; and in removable blades, whereby they may be readily removed in case of an accident or fault in either, requiring the substitution of another. The object of the invention is to provide shears which, on account of their formation, will be superior so those now in use in durability and ease of operation, closing with less force and reacting quicker, firm in handling and precise and strong in use, and easily repaired and kept in order.

GRAIN DRILLS.—Calvin G. Hampton, Turlock, Stanislaus Co., Cal. No. 303,153. Dated Aug. 5, 1884. This invention relates to that class of seeding implements or grain drills in which the seed is conducted from a hopper or seed-box through an intermediate conveyor to the drill-tube. The invention consists in novel means for feeding the seed from the hopper accurately and definitely, and in certain improvements in arranging and combining the various conveyors and drill-tubes, whereby all the necessary adjustments and the yielding of the drills can be accomplished without disturbing the relation or communication of the parts. There are certain details of construction covered by the patent. To effect the operation, the object is to provide a grain drill which can be easily handled, effective in operation, and not likely to get out of order or become disarranged in any of its parts while in use.

HARROW.—William A. Howard, Dixon, Solano Co., Cal. No. 303,223. Dated Aug. 5, 1884. These improvements patented consists in a wheeled platform carrying a seat; in a novel connection between the platform and the harrow-sections, whereby the latter may be raised; in a mechanism for cleaning the harrow teeth; in the hinge or joint between the evener and the sections, and in a peculiarly adjustable draft.

Iron and Concrete Construction.

(*Continued from page 133.*)

axis seeking extension, and all above compression. How slight are the *duties* of the *web* of a *beam* under these circumstances may be seen from the exceeding thinness to which it is possible to reduce it, which fact seems to confirm the view that the web of a beam possesses cohesive power sufficient to resist the shearing strains resulting from a bending stress; it is equal to all the duties required of it, all other strains upon it being secondary and inferior.

It is not difficult to understand how a metal tie is held in the embrace of a concrete web, nor how a web of concrete four or five times as thick as metal webs are usually made, should be quite able to perform its part and become equally serviceable.

A flat tie as is exhibited in Figs. 26, 28 and 30, plate *J*, [omitted—ED. PRESS] on account of the large holding surface presented for the concrete as on that of the bottom flange of the rolled beam dwelt on in the fore part of this, in Fig. 1, is probably the best form in which iron can be used.

When placed edgewise, as in Figures 15, 16, 17, 18 and 19, the illuminating tile, plate *K*, seems to be the most convenient tie that can be employed; the wires that connect the bars, called the gridiron tie, serve as stopes to prevent the metal sliding when the beam is under strain. This evidences that the tie becomes attached to the web practically throughout its entire length, and as firmly at one point as at another.

The Formula for Computing the Strength

Of this Portland cement concrete beam, providing the ties are all a sufficient distance below the neutral axis, should be as in that for computing the strength of a wrought iron plate girder. With the latter we first proportion the top and bottom flanges in metal quantities, correspondingly to their resisting power to compression and extension. Wrought iron being about 35 per cent the weaker in resisting compression, much more metal must be in the compressive member than in the tensile one. After proportioning the beam no more attention is given to the part subject to compression, but only to ascertain the section of the bottom flange subject to extension, and the depth of the beam; and as our tensile member in the Portland cement concrete combined with iron is of wrought iron, and is held to the web and exercised in the same way as in that of the plate girder, and all other parts are in the same relationship, the constant must be the same. Therefore, after the concrete beam is proportioned to have sufficient concrete material for compressive strength to balance the tensile capacity of the ties held in place, and at a sufficient distance below the neutral axis, then we proceed as in that of the wrought iron girder after the parts of it are balanced in their respective resistances.

First, for a numerator multiply the sectional area of the iron tie bars, deducting for holes, by the depth to be from the center of the tie bars to the top of the beam, and multiply the product by the constant of 80, as in the formula of the wrought iron girder.

For the denominator take the number of inches between the supports; the quotient will be the breaking load in tons in the center of the beam. All parts performing their respective duties is equally applicable in this composite construction as in that of the wrought-iron girder.

It is the basis in supporting power serviceable in so many applications in buildings and other constructions, as supporting walls for floors, slabs, sidewalks, beams, girders, etc.

No. 2, shown at the bottom of plate *G*, was a

Beam of Concrete Without Iron,

And broke at 1,484 pounds; and, taken as a unit in contrast with the following, that were tensilely strengthened by iron ties, as shown in plates *G* and *J*.:

No. 19, plate *A*, had 21 pounds of iron, which increased its strength 11½ times of the plain concrete beam (No. 2 in plate *G*, and computed by the formula given), broke at 1 per cent in excess of formula.

These tie bars were kept at a proper distance below the neutral axis which was not the case with the others; had the tie bars been a greater distance below the neutral axis undoubtedly better proportionate results would have been attained.

Plate *G*.
- No. 15 had 62 lbs. of iron which increased its strength.....17 times.
- No. 16 had 52 lbs. of iron which increased its strength.....17-1-10ths times.

Plate *J*.
- No. 17 had 44 lbs. of iron which increased its strength.....16 times.
- No. 18 had 31 lbs. of iron which increased its strength.....14 3-10ths times.
- No. 19 had 21 lbs. of iron which increased its strength.....11½ times.

No. 26 had 31 lbs. of iron (flat ties) which increased its strength.
No. 28 had 35 lbs. of iron (flat ties) which increased its strength.
No. 30 had 40 lbs. of iron (flat ties) which increased its strength.

With these three latter being four inches greater in depth could not compare results with No. 2.

In all cases the iron ties broke, and were finally held in the concrete body in the manner that a bottom flange of an iron beam is held to its web.

In San Francisco, Nov. 3, 1883, at No. 231 First street, a

Portland Cement Illuminating Tile,

Combined with iron ties, as shown on plate *K* was tested, but being only 20 days old, was not old enough for great strength, but was still in excess at that green age of the heaviest cast iron illuminating tile ¾ of an inch thick and tested centrally in the same way, which broke at 2,105 pounds, while the new cement tile broke at 2,171 pounds. Both of these tests were witnessed by H. Hanstein, Jas. B. Lane and L. Girolt.

On Nov. 23, 1883, at the same place, a trial was made of the same size Portland Cement Illuminating Tile about 40 days' old, as shown in plate *K*, and the fractured tile presented, of which Fig. 1 is the top, and Fig. 2 the bottom. Fig. 3 is a cross section, and Fig. 4 shows the iron ties, five in number, 1×⅛ of an inch flat iron, threaded on ten 3-32 of an inch steel wires subsequently, 3 16 of an inch iron wires were used—total weight of iron and steel 3¼ pounds, tested by an octagon steel bar of one inch in diameter, presenting a half inch surface bearing centrally across the tile.

At	1376	pounds deflection united,		5-32	inch.
"	1543	"	"	7 64	"
"	1717	"	"	1 8	"
"	1908	"	"	3-32	"
"	2017	"	"	3-16	"
"	2150	"	"	13-64	"
"	2230	"	"	1 4	"
"	2405	"	"	9 32	"
"	2600	"	"	3 8	"
"	2716	"	"	29 64	"
"	2750	"	broke.		

Witnessed by Mr. John Wright, Mr. G. W. Percy and Mr. W. P. Moore, architects, of San Francisco.

The Portland cement, combined with iron illuminating tile 1¼ inches thick, bore 635 pounds more than the heaviest cast-iron illuminating tile used over areas ¾ inch thick, both tested in the same manner.

A trial was made at the Industrial Iron Works, on Beale street, San Francisco, January 19, 1884, of a Portland cement concrete slab, with iron, such as will be used for sidewalks and floors, dispensing with supporting arches. It was 3 inches in thickness, and 4 feet 6 inches square—20 feet 3 inches, resting on two end supports, each 3 inches, leaving the distance between supports 4 feet, and by 4 feet 6 inches—area 18 feet.

The ties consisted of 19 1-inch wide by ¼-inch thick bars, placed 2½ inches centres, and threaded on 9 ½-inch diameter iron rods, placed 6 inches centres; total weight of iron, 41 pounds.

The top of the flat bars were 1½ inches below the top of slab. Age of slab, 62 days.

This was tested in the presence of Mr. G. W. Percy and Mr. John Wright, architects, as follows: Loaded with—

18,234 lbs. pig iron deflected 9-32 of 1 in. or 900 lbs. ⅟ ft.
21,111 lbs. pig iron deflected 5-16 of 1 in. or 1,042 lbs. ⅟ ft.
24,146 lbs. pig iron deflected 3-8 of 1 in. or 1,192 lbs. ⅟ ft.
26,885 lbs. pig iron deflected 7-16 of 1 in. or 1,328 lbs. ⅟ ft.
29,344 lbs. pig iron deflected 1-2 of 1 in. or 1,450 lbs. ⅟ ft.
32,747 lbs. pig iron deflected 9-16 of 1 in. or 1,617 lbs. ⅟ ft.
35,006 lbs. pig iron deflected 5-8 of 1 in. or 1,725 lbs. ⅟ ft.
36,375 broke at 1,797 lbs. per ft.

At 32,747 pounds, or 1,617 pounds per foot and 9-16 deflection, a small crack was first observed.

The question was asked as to the stability of this construction to resist impact.

The speaker said that when the deflection caused by force of impact was within a certain safe limit of the elastic force of the material, it is equally as serviceable as in other substantial constructions. In the computation as to the safe bearing load of any construction, the most severe service it may be subjected to must be considered, so that the strain in such service is within a certain recuperative force of the material. With cast-iron beams it is safe to employ them at rest at one-third the breaking load. In this construction for sidewalks and floors, etc., I take it that one-fourth of the breaking weight will be a safe employed load.

For fire-proof walls and other surfaces and purposes, Mr. Hyatt has found that mixing a small percentage of sulphur with a body of Portland Cement, and then heated to a red heat, will stand the effects of cold water when thrown upon it.

I have made the trial with this composition, made in brick form, and when heated red hot and thrown into a pail of cold water, it retained its form nearly equal to fire-brick; while a body of neat cement of the same form and age, and by the same treatment partially dissolved like sugar when placed in the water. Mr. Hyatt has secured these combinations by two United States patents of which Mr. Jackson has the right for this coast.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Mining and Scientific Press,

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering Building and Manufacturing Tools and Implements, Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco

New Book on Assaying Gold & Silver Ores.

BY C. H. AARON.

For Practical Workers. $1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfull opular " is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balances; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth: 1881. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

N B. This is Part I of three volumes on assaying by the same author. To be followed by Part II. Gold and Silver; Part III. Lead, Copper, Tin, Mercury. A majority of the best mining publications yet printed have been issued by and are for sale by DEWEY & CO., publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Lost Papers.

If any subscriber fails to receive this paper promptly, after making due inquiries at the Postoffice, he is urgently requested to notify this office by *letter*, that we may send the missing papers, and, if possible, guard against further irregularities

Educational.

THE EMBREY CONCENTRATOR.

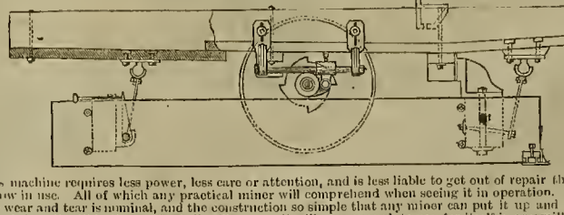
Having sold my interest in the EMBREY CONCENTRATOR to the Frue Vanning Company, I offer for sale at cost a few I have on hand to close the business.

STEPHEN P. M. TASKER,
Fifth and Tasker Sts., PHILADELPHIA, PA.

INVENTORS. L. PETERSON, MODEL MAKER,

253 Market st., N. E. cor. Front, up-stairs, S. F. Experimental machinery and all kind of models, tin, copper and brass work.

PATTEN'S
CONCENTRATOR AND AMALGAMATOR COMBINED.



This machine requires less power, less care or attention, and is less liable to get out of repair than any Concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all millmen, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

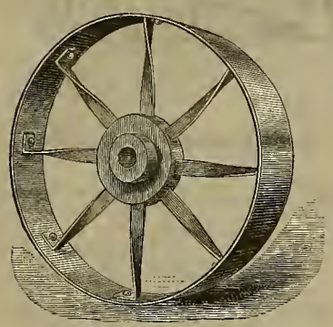
The undersigned is now located at the Etna Iron Works, 217 to 221 Fremont street, where he is building the above machines and prepared to fill orders, and guarantee them to do all that is claimed. Weight 625 pounds; price, $300 Estimates given and orders promptly filled for all kinds of Mining Machinery.

☞ Assays and practical working tests made of ores.

C. W. PATTEN, 217 Fremont St., San Francisco.

Iron and Machine Works.

MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq. —Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

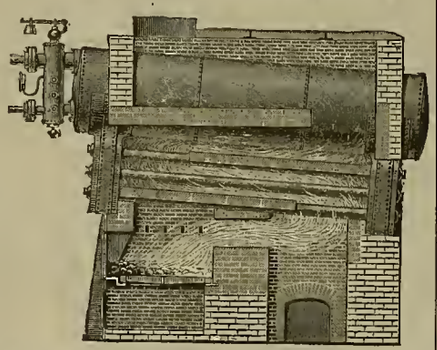
Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, MO., Sept. 26, 1883

Messrs. Adolphus Meier & Co. GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASS'N.

OFFICE OF SUP'T OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 24, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

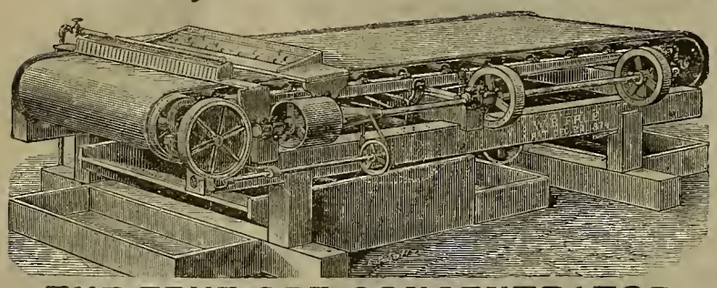
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

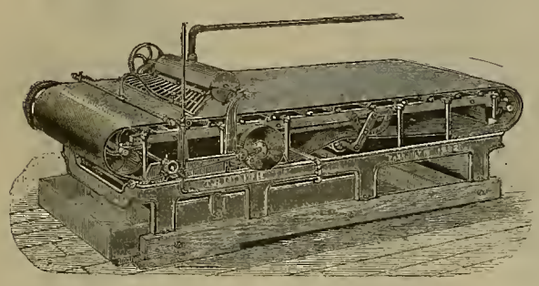
The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B. We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test, which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 Fremont St., San Francisco, Cal.

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE
Cheapest and Most Effective Machine
OF THE KIND NOW IN USE.
Adapted to All Grades and Classes of Ores.

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coaser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 6, 1884.

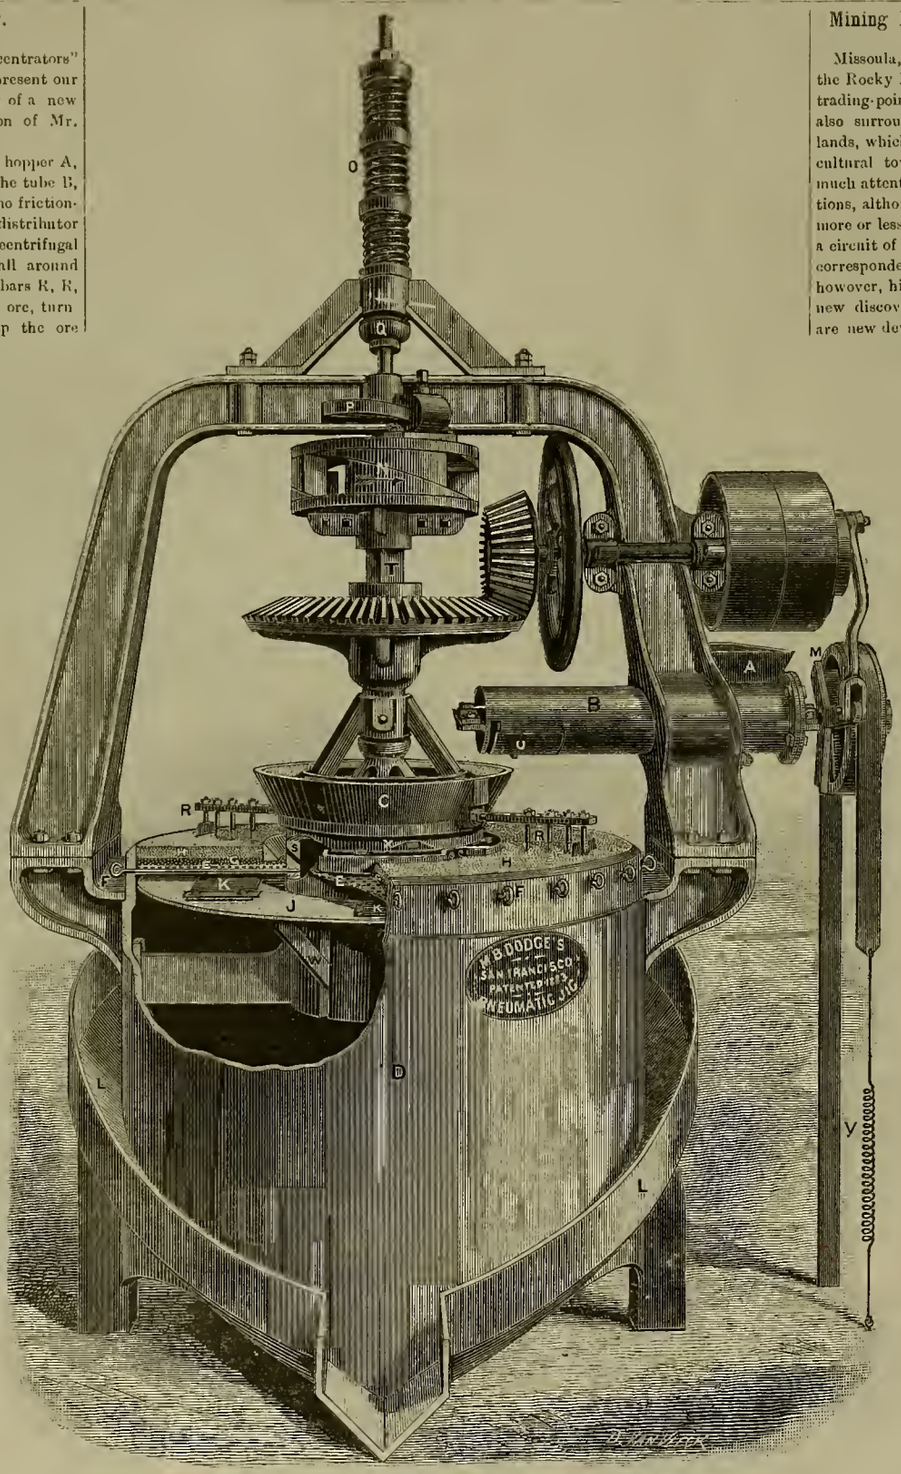
VOLUME XLIX. Number 10.

Dodge's Pneumatic Jig.

Having described several "wet concentrators" in recent numbers of the PRESS, we present our readers this week with an engraving of a new dry ore concentrator, the invention of Mr. Miles B. Dodge of this city.

The pulverized ore is fed in at the hopper A, from which it is conveyed through the tube B, in which is a conveyor actuated by the friction-clutch M, delivering the ore into the distributor C, through gate U, which, by the centrifugal motion, distributes the ore evenly all around on the machine D. The small iron bars R, R, with iron stirrers, go down into the ore, turning with the distributor C, and keep the ore even on the bed of the machine. Motion is given to the bellows J by the gear-wheels and disk T, on which are three cams, N, which move a rod downward that is connected withthe bellows J by arms W. When the cams move the bellow's disk J down, air is taken in as the cams drop off from each other, the steel springs O bring the bellows up suddenly, striking on the buffer Q, which causes a sudden strong puff of air through the sheet-iron screen E, and lifts the mass of ore on the machine very rapidly, the mineral taking a position as may be seen by the dark stratum of mineral G, and the gangue or worthless rock taking its position on top of the mineral, as will be observed by looking at the stratum of sand H, H, which is of a lighter color than the mineral on the bed. By looking closely, near letter S, is a cup which comes down close to the screen E, which only allows the mineral to pass under it. As the top line of mineral is above the space under the cup, the mineral, rising up by the puffs of air on the inside of the cup, passes out of the machine at the opening S, down into a box in the center of the machine. That the mineral may not pass out too fast and leave too little bed of mineral on the machine, there are gates of sheet-iron that may be seen in the engraving, which will regulate the amount of mineral required on the machine. The fine mineral passes through the screen, on and off between the edges of the bellows J and the machine, into the box of minerals in the center of the machine. While the puffs of air are constantly making a separation of the mineral and gangue as it comes on to the machine, the worthless matter passes over the edge all around the machine into the troughs L, L, and passes off from the machine. To the rods F are fastened the screen that holds thebed up by loops of wire passing through the screen around the rods and twisted up in loops. The strap of leather and wire spring V is to give steady motion to the friction-clutch.

The machine has been well tested, and may be seen in operation, at any time, at the works of Messrs. Savage, Son & Co., No. 139 Fremont street, in this city. Mr. Dodge claims to be able to do closer work with this concentrator than can be done by wet concentrators.



DODGE'S PNEUMATIC JIG FOR CONCENTRATING ORES DRY.

Mining Prospects at Missoula, M. T.

Missoula, lying at a gateway in one spur of the Rocky Mountains, and therefore a natural trading-point in the early history of our frontier; also surrounded by agricultural and grazing lands, which have made it somewhat an agricultural town—this place has never olicited much attention as a center for mining operations, although there have for many years been more or less operations in that industry within a circuit of 20 miles from the town. As our correspondent passed through the place recently, however, his attention was directed to certain new discoveries and prospects. First, there are new developments in the old placer camp, called Nine-mile District, that distance from town. Here have existed for many years, placer works on a small scale, but quite lately a ledge of quartz has been struck, which, from average assays, yields about $80 per ton, the larger percentage of value being in gold. The samples assayed were from the French lode, which is the property of Mr. Dickinson, the postmaster at Missoula, Mayor Meyer, a fine machinist, and Dr. De Nayer. There are two claims adjoining the French lode, and prospecting is going on with good results by other parties. Then, there have been assays made from ore taken out of ledges discovered in the Wallace District, lying about 20 miles east of Missoula, near the line of the N. P. Railroad. The discoveries here are quite recent. Already about 40 locations have been made. The Aladin, an iron-cap mine, is down 75 feet; the Kenebec, down 60 to 70 feet; Potosi, 35 to 40 feet; West Point, 35 feet; and the Hidden Treasure, 35 feet. In the latter location the ore crops out at the surface, and specimens from it are the principal samples treated to ascertain the value of the developments. Already the Hidden Treasure is bonded for a large sum. The ore in this district will need to be smelted, but abundance of timber for charcoal or for direct smelting uses is abundant. So also is water. The ore carries copper, 15 to 20 per cent in value; silver, 60 per cent; gold, 15 to 40 per cent. Already four veins of ore have been struck, all lying parallel. Our information concerning these matters is derived mainly from Captain Dickinson, of Missoula, who, with Captain Higgins, of the Missoula Bank, and Messrs. McCormick and Choquette, propose to do what they can to develop the hidden resources in the vicinity of their town. A meeting of the citizens of the place was to be called soon, to discuss steps that might wisely be taken.

Cauca Mining District, U. S. of Colombia.

The following is a portion of a paper read before the American Institute of Mining Engineers, by John Hays Hammond:

The following notes are descriptive of a country as yet in its infancy as regards the advancement made in mining operations. Its inaccessibility and other militating circumstances have started progress in that direction. With the completion of the railroad, now under construction, having the city of Cali as its objective point, with the concomitant civilizing and developing consequences, it is certain that the slopes of the Cordilleras will prove to be a South American Eldorado. Deposits of coal, copper and minerals other than those of the precious metals are known to exist in quantities which, under more favorable conditions of accessibility, etc., could be profitably mined. The Government of the United States of Colombia, I think, is disposed to encourage and foster mining enterprises. Articles designed for mining are admitted free of duty; the permanency of the government is, at least, as well assured as that of Mexico (which is not noted for its immutability), and a more sincerely friendly sentiment towards Americans prevails in the United States of Colombia than in Mexico. This paper is confined to a description of the property of the Cauca Company's mines, and is intended rather as a preliminary notice than as an exhaustive report. The Cauca mining district is reached by the following route: New York to Aspinwall; to Panama; to Buenaventura, a port on the west coast of the United States of Colombia, distant thirty-six hours from Panama by steamer; to Cali, in the State of Cauca. The State of Cauca is bounded on the north by the Atlantic ocean, on the northwest by the State of Panama, on the northeast by the States of Bolivar and Antioquia, on the east by Brazil and Venzuela, on the south by the Republic of Ecuador, and on the west by the Pacific ocean. It has a territory of 41,443 square miles, which is about one-tenth of the entire territory of the United States of Colombia. Its population, including the 50,000 savage Indians of the Caqueta (some of whom are cannibals), is nearly 450,000 souls, or about one-sixth of the population of the Colombian republic. Of these one-fifth are whites (Spanish South Americans), two-fifths mixed, two-fifths negroes and Indians. The climate of the country varies in its different parts. Along the coast are fevers of the most malignant types, but the interior and more elevated portions are exceptionally healthful. There are two dry and two wet seasons, alternating, designated respectively *verano* and *cierno*. To the dry season or *verano*, belong the months of January, February, March, July, August, and September, while the other months are included in the *cierno* or the wet season.

Cali is a city of some 13,000 inhabitants, situated in the beautiful, fertile, and salubrious valley of the Cauca, a valley included between the western and middle ranges of the Cordilleras of the Andes. It is about seventy miles distant in a southeastly direction from the port of Buenaventuta, and at an altitude of 3,400 feet above the sea-level. The city of Cali is reached by means of a railroad to its present terminus, Cordova, twelve miles from Buenaventura, and from there by an excellent horseback road to the foot of the Western Cordilleras, whence a good, but somewhat steep road, crossing the mountains at an altitude of 6,000 feet, leads to Cali. The mines of the Cauca Mining Company are embraced in a large tract of land, covering some 400 square miles, and situated about 40 miles to the south of Cali. The situation of the company's mining property is in many respects most favorable. The climate in that section is one of rare salubrity; the heat due to the close proximity—about two degrees north latitude—to the equator, is tempered by the high altitude of some 4,500 to 5,000 feet above sea-level. Water and fuel are everywhere abundant; provisions are plentiful and cheap; and labor, though at present somewhat scarce, could, in the event of the inauguration of mining, be obtained from neighboring districts. Experienced Spanish-American miners from the adjoining mining States of Antioquia and Tolima, at from one to two dollars per day, with negroes, or preferably Indians, for from 50 to 75 cents per day, could make up the complement of mining laborers, were an enterprise to be initiated upon this property.

At present mining is carried on in a most primitive manner. Negro women are

The Miners of the Country.

Their implements of mining are restricted to the crowbar and the *almocrafre*. The *almocrafre* is the vade-mecum of the prospectors of the Cauca country. It is to them what the pick and shovel are to the prospectors of our country. This tool is a blade of steel from eight to twenty inches in length, and from four to eight inches wide. The blade is bent and the end pointed, somewhat resembling in form a pruning knife. It has a handle about a foot long. Picks, shovels and powder are almost entirely unknown. *Puruheles* of the Mexican pattern take the place of wheelbarrows. The *batea* replaces the miner's pan of our own country, and in fact is the only method known to the people for extracting gold. Mercury is rarely used.

With reference to its geographical position, the property may be divided into the "Ensalvado" and the "Cauca" mines.

Ensalvado Mining Property.

The Ensalvado property, lying to the west of the river Cauca, consists of two classes of mining property, different with respect to their geological character. To the first-class belong the auriferous quartz veins, having an approximately parallel easterly and westerly trend through the granite, which almost invariably constitutes the country rock of this district. The developments upon these veins, consisting of but a few feet of shafts or tunnels, are too small to permit any predication as to the persistency of the gold-tenor of the ore in its distribution along the strike and dip of the veins. That the fissures are "permanent," or that the veins are what are generally designated "true fissure-veins" is well evidenced by abundant indications, characteristic of that class of deposits. But it must be observed that the continuity of the fissures is not to be confounded with the continuity of the gold-tenor. The latter can be only ascertained by actual explorations on the veins, especially in a mineral district of underminded character in this regard.

Attending the working of the veins are many economical advantages. Water and wood are everywhere abundant; the topographical features of the country admit in many places the exploitation of the mines by means of tunnels, whereby is obviated the erection or maintenance of an expensive plant for the extraction of the ore; and whereby also, water under high pressure may be utilized for mill-power, effecting a saving in the cost of milling-plant and in the subsequent treatment of the ore. Unfortunately, the veins are narrow, and the extraction of the ore would, in most instances, necessitate the removal of a large volume of the inclosing non-metalliferous granite country-rock. This rock, though more or less soft near the surface, owing to the superficial decomposition, will be found compact and hard when but little depth shall have been attained; and the expense incurred in its removal must needs be very considerable. The ore of the veins consists of a quartz gangue, carrying free gold and chiefly auriferous iron and arsenical pyrites. In some of the veins the ore is much decomposed, while in others the matrix is hard and the ore but little altered.

The Cauca River Mines

Lie immediately in and along the banks of the Cauca river. Much gold has been obtained, and is still extracted from this source. The deposits in question belong to the *Playas*, or alluvian deposits of the river Cauca. These are the results of the deposition by the river Cauca during a period when it assumed larger proportions than at present. The *Playas* are contiguous to the present channel of the Canca. The deposits are obscured to a great extent by vegetation, and as yet are opened up for inspection at but a few points. There are many square miles of these auriferous alluvions, but, owing to the very limited period of my visit to this property, I made an examination of but one point, which was represented to have yielded a large quantity of gold when worked in former years. The inundation of the excavation prevented the further working of these deposits. With the cradle I tested considerable quantities of gravel from different points about the old pits. My tests showed the top-gravel to carry from 10 to 50 cents per cubic yard. These results were obtained from points several feet above the bed-rock. Unfortunately, the bottom of the pit was covered by water, which prevented the sampling of points nearer the bed-rock. Careful sampling and tests made by Messrs. Rahmer and Masse, who carried on the work after my departure, gave much better results than those obtained by me, as above indicated. They were enabled to obtain samples within a few feet of the bed-rock. The gravel from the depth reached by them gave from $4 to $10 per cubic yard, showing very great richness at that level. I have no doubt as to the accuracy of these results; but their sampling was unfortunately necessarily confined to a very limited area. The great disadvantages accompanying the working of these deposits is their flat character and the inferior position of the bed-rock with reference to the water level of the Cauca river. This unfavorable location necessitates the draining of the pits or excavations by means of pumps, and also requires considerable manual labor in the extraction and washing of the auriferous gravel; but there is very little superincumbent material that would not defray a considerable portion of the expense incurred in its removal; and this is a feature of considerable economical importance.

Notwithstanding these disadvantages, if the above experiments made by Messrs. Rahmer and Masse for the determination of the gold tenor of the gravel are not misleading, the *Playas* are certainly worthy of a thorough exploration. The bed-rock has never been explored; and it is from points immediately overlying the bed-rock that the best yield of the gravel is to be anticipated.

CEMENT HARDENING.—Herr E. Landrin, in a paper on the theory of cement hardening, calls the silica which has been precipitated from a silicate by an acid and ignited at a red heat, "hydraulic" silica. It is this which effects the hardening of hydraulic mortars. He disputes the hypothesis of Le Chatelier that the hardening of cement depends, as in the case of gypsum, on supersaturation phenomena,

The Lake Valley Mines.

Concerning the progress of the Lake valley mines, New Mexico, the *Herald* has this to say:

It is nearly three months since we visited and wrote in detail of the condition of the Sierra mines. The work accomplished in that time is certainly extensive, and as important as extensive. All that we stated then as in contemplation has been accomplished, and very much more, while the results in discovering ore bodies are far beyond the expectations of the managers at that time.

First let us look at the improved facilities for working the mine and handling the ore. The loading bins are the first of the improvements to attract attention as you approach the office. Three large bins, for filling when there are no cars at hand, and two shoots, for loading direct from the tram cars, give facilities for loading five cars at a time, which can be accomplished in two or three hours. The tramways run by an easy grade directly into the mines, running out four cars at a time, in charge of one man, and being hauled back by a mule that has almost become automatic in his movements. We found the grade completed for the tramway to the mill, but the track was not yet down. Two days' work will complete it. A tunnel for a double-track railway is being driven—probably complete by the time this will reach the eye of our reader—through the ridge west of the office, much of the way through an excellent body of ore, the purpose being to remove the waste, which is in the way and liable to need frequent removals if piled over the mine as heretofore. By this means an unlimited dumping ground is secured, convenient to the mines, where all waste is moved direct by the tram cars with only one handling.

The steam drills (Ingersoll's) had been at work just about two months, except one of the four, which has not been needed yet. The amount of work accomplished is the best certificate of the value of this investment. Two have been in use constantly, driving the tunnel before referred to, and the third one has been employed most of the time in the open cut of No. 25, where the drilling was done faster than it was possible to remove the rock and ore. More than 100 holes, from 8 to 15 feet deep, are already drilled that have not yet been blasted, the blasting of which would loosen more material than 100 men could remove in 30 days.

A visit to the mine gave a complete surprise; drifts, at the last visit, had been enlarged into chambers, from which tens of thousands of dollars had already been taken. In the principal one of these chambers they are now using 26 feet props, which means that the ore body is being excavated to a depth from a hanging wall of that many feet; nor is it taken out to the bottom of the ore, the lower grade of that at the bottom rendering it inadvisable to remove it at present. In the chamber the hanging wall only is exposed; there is ore on every hand, of varying grade, but nearly all of it a shipping grade; rich streaks are being followed upward from this chamber, yielding hundreds of sacks of the precious stuff. This ore body is the one discovered by the diamond drill when it was first put in operation, and it is proving larger in extent and better in quality than was indicated by the drill. It is about 80 feet below the surface, and the pitch of the hanging wall, which is uniform for quite a long distance where it has been exposed, indicates that it has a definite formation and extends to an indefinite depth. The explorations of a former manager in this direction led to the conclusion that it was not worth while to look in that direction at all, as there were no indications of ore.

In the absence of the manager we do not feel at liberty to give the details of production and shipment, though we learned something of them in an unofficial way. Regular shipments amount to about two cars daily, and of a higher than average grade. We may safely say that the shipment from Grande was more than 890,000 for the month of July, and about $150,000 for the past two months—this, understand, from a "played out" mine, according to former managers.

The number of men employed in the Grande is about one hundred and seventy, and in the Bella seventy. The force on the Apache has been taken off and both of the diamond drills are being used for the prospecting there now. The Bella is not at present yielding as it was at the time of our last visit, the drifts having run through the rich streak of ore which they were in, but the prospect is good for finding them again any day.

In conclusion we may add that the mines never promised better than at the present moment. With large ore bodies in sight and good prospects for their continuance, and with facilities for rapid and economical workings, with prudent and skillfull management the stockholders may reasonably look forward to a period of dividend payments, which will not be disagreeable to them. The extaordinary expenditures for outfit and putting the mine in order are practically completed, and now the entire net proceeds will be available for dividends.

STEAM ROCKETS.—The fact that a steam boiler, standing on its end, can, by explosion, project itself several hundred feet away, passing over the tops of buildings in its flight, has suggested the invention of a steam sky-rocket. It is thought that such a device might be made specially serviceable as a war weapon.

Gold in Alaska.

A frontiersman named Louis McQuesten who has been in Alaska since 1874, most of the time on the Yukon river, has been interviewed by a *Call* reporter, and among the facts, the following points concerning gold in that region were elicited: Evidences of the precious metals can be found in many parts of Alaska, and I have no doubt that at some future time fortunes will be made out of mines in that region. I wouldn't advise any one to go there with that object in view, however, for a prospector's life is pretty hard up there, and very few will ever make anything in the attempt. Still the gold and silver are there, and whenever they are wanted bad enough they'll be got out. I know of numerous places where there are good placer diggings, and of others where the surface rock looks very promising. For instance, there are lots of bars on the Stewart river, and its tributaries where a man can easily pan out from $5 to $10 a day, and there is just as good a show on the Pelly, and other streams I could mention, while there is a sure $5 a day placer digging within sixty miles southwest of Fort Reliance. Most of these places are very hard to get at, however, and there are very few years when it is warm enough for more than four months' sluicing. Two hundred miles from us, on the Pelly, a prospecting party took out over $700 in dust last summer, and found lots of what promised to be paying quartz leads. They have gone back there this year, to stay through the winter, so as to be early on hand next spring. It is a very tight place to get in and out of, and a party must carry with them all their supplies. From this place on the Pelly they can make the 200 miles to us by dropping down to the Yukon, but the easiest road to get in is a very round-about way. Taking this road you would not start earlier than June 20th from Harrisburg, on the coast, portage sixty miles to the headwaters of the Yukon, and then work down from 350 to 400 miles till you reached the Pelly and the placers. To get out of that place you would have to start by the end of July, for it is very risky to make the attempt after the snows have set in. You see, therefore, that in most of the placer mining you would have to give up an entire year for four or five months' work, and when you take into consideration the cost of supplies and labor of transportation, the result in gold dust would scarcely compensate you. We have struck some ore that looks pretty well right at Fort Reliance, and I have brought down a lot of it with me to assay. If it should turn out to be as good as it looks, our chances would be very fair, for we could get our transportation, etc., comparatively cheap. As I said before, the day will come when a good many mines will be opened up in Alaska, but that day is pretty well distant yet, and won't stand much hurrying, although here and there will be a chance to make money under exceptional circumstances.

THE CUMNER ENGINE CO. have sent a 130-horse-power engine to the Louisville exposition, to drive several of the electric light dynamos on exhibition. They will also furnish one of their Ballantine ice refrigerating machines and a 130 horse-power engine for the St. Louis exposition. The engine will drive an important line of shafting, and the refrigerating machine will be used to keep a comfortable temperature in the music hall, and for referating any perishable articles that may be on exhibition. The following orders have recently been lodged with the Cumner Co.: One large refrigerating machine, with oiled-panel purifier, for the Crescent Brewing Co., of Aurora, Ill., to displace a machine of another make; three refrigerating machines, with apparatus complete, for the large brewery of Heusler & Sons, Newark, N. J.; a 120 horse-power engine, with boilers and outfit complete, for W. H. Cherry & Co., Mountain Mills, Ala.; and two engines, one 250 horse-power and the other 105 horse-power, for the Brooks & Ross Lumber Co., Schofield, Wis. The following are among the recent shipments of this company: A 55 horse-power engine, with outfit complete, for the Fort Wayne Jenney Electric Light Co., for their new plant at Gosben, Ind., and a 55 horse-power outfit, complete, for the flour mills of A. Dietly & Son, Moorheads, Pa. In addition to the above they expect to ship two more good sized engines and another refrigerating machine in the early part of next week, and report orders coming in freely. Cumner engines have just been started in the following places: Amoskeag Cotton Mills, Manchester, N. H.; saw mill of A. L. Johnson & Co., Mimcie, Ind.; linseed oil mills of I. P. Evans & Co., Indianapolis, Ind.; and in the flouring mills of C. B. and D. H. Cowan, Canal Winchester, O.

BUSINESS HASTE.—A medical writer has lately penned a paragraph full of warning to men in trade. He justly ridicules the common practice of persons engaged in commerce, of pretending to be in great haste, and terribly pressed for time at almost every moment of the day running, so to speak, a close race perpetually, as it were, with the old mythological gentleman with the forelock. The house is overwhelmed with business, forsooth. By-and-by this pernicious practice becomes a confirmed habit, the fertile source of many nervous disorders, and not infrequently ends in the mad-house, or a suicide's grave.

MECHANICAL PROGRESS.

Rock Cutting and Dressing Machines.

The rock extracting industry seems to ever remain at the same point. Little progress has been made in the method of quarrying, and nearly everywhere use is still made of the wedge, the lever and powder. Aside from the cost of the work and its defectiveness, there results considerable waste, while the blocks extracted are irregular in shape. To meet these inconveniences and imperfections by some machinery adapted to such work has been the study of inventors and engineers for some years past. Quite recently a Mr. Rapp has devised a machine for cutting rock from the quarry, of which much is expected. The steam power required to run it is from three to four horse power, and the work effected per day by the aid and boy required to run it is equal to that of several men in the usual way, while the work turned out is in regular smooth pieces, all ready for rough use or for immediate finish. The machine may be employed elsewhere than in quarries, and also serves for almost all works of excavation.

Another Quarrying Machine

Is the recent invention of Mr. John Crump, of Philadelphia. Mr. Crump four years ago proposed to himself the project of devising a machine to cut and finish with true surface all kinds of building stone as it lies in the ground, thus saving the enormous waste of blasting processes and the handling of the waste. He engaged Mr. Brereton, the foreman of his quarry, to assist him, and the result of their labors is a novel "rock quarrier and stoneshaper," which they have had patented in all countries under the above name. Its cutting power is shown by the ease with which it goes through the flint in this slate quarry, where at least it is capable of doing remarkable work. Whether it can be as successfully employed in cutting and shaping granite and other hard rocks is not decisively proved as yet, though it is designed for such use.

The machine in its essential features is as novel as it is effective. It looks like a very course circular saw, but is not driven like a saw, and it makes its cut in an entirely different way. Thus, it runs backward, cutting upward instead of downward, moves very slowly instead of rapidly, and it is driven not from its axle, as saws are generally driven but from its periphery. The cutting desk is substantially like that of a saw, with removable chisel teeth. These have an alternate "set," right and left, and at intervals there is a straight tooth to clear out the silver that the two sets of teeth might otherwise leave. The feeding mechanism is worm-screws and cog-wheels, so geared with the cutter that they move in unison. The whole machine (including the boiler and the steam engine) is mounted upon one framework, and all of the mechanism travels together upon an iron trackway laid upon the rock to be cut. The depth of the cut made is nearly one-half the diameter of the cutting disk, and may be of any length that the quarry permits. The cutter may be set at any desired angle, and if the stone is to be finished before its removal, files are attached to each side of the saw-plate, slightly wider than the cutter, thus removing the saw-tooth marks.

The teeth of the cutter are removable, and they are removed and replaced while the cutter is at work. The cutters do not get hot. The machine moves so slowly that a boy has plenty of time to take out a dull tooth as the saw comes up from the stone, and replace it with another before the part of the blade from which it was removed has again passed below the surface of the stone. A boy is employed at this work all the time, and with a set of machines at work, the teeth are being constantly re-sharpened, ready for return to the cutting disks of steel. In the roofing slate-quarry, the machine is said to work admirably. It makes a cut "across grain", about 36 feet in length, or with the grain 75 feet in a day, and of a depth proportioned to the diameter of the saw or cutter. There is practically no waste in quarrying by this process. It saves from 10 to 30 tons of waste for each ton made marketable. Cross cuts, leaving sharp square edges and corners, can be made, but in quarrying for roofing slate only lateral cutting is required. Two parallel cuts having been made, a line is nicked out where it is desired to split off the block, and a few sharp blows determine the fracture. The blocks are then removed from the quarry, and at once split and shaped by expert workmen into roof slate.

Finishing by Pressure.

Under this heading a paragraph recently appeared in this journal stating that drop-forged articles of Norway iron had yielded to a permanent compression of one four-hundredth of an inch under a pressure of 800 tons. The result of this compression is to change the character of the material to a considerable depth, compacting its fibers so that the surface is almost a perfect one, requiring but a slight amount of polishing to bring out its clean, bright characteristics.

More noticeable results have been obtained on articles of malleable cast iron, the honeycombed, loose fiber of the re-heated casting being forced in on itself, so as to greatly change its character. Under a pressure of 500 tons the malleable iron yields almost one-sixteenth of an inch, and becomes almost as solid as steel. Wrenches for agricultural implements, and for ordinary farm, stable and home use, cast and made malleable by heating in boxes packed with pyrogenous oxide of iron, come out so soft and yielding in texture that they are almost like pewter; but put under this pressure, they come to a rigidity that is surprising, resembling that of tempered steel.

A press for this work has recently been built, which produces the pressure by the well-known toggle or knuckle joint. The machine weighs seven tons; the head under which the pressure is given is re-enforced from the base by two five-inch steel bolts; the dies are adjusted by screws moving an inclined plate or wedge, that provides a solid bearing at all times and at every stage of adjustment. The throw of the die is one and a half inches, and is produced by the toggle joint driven by a lever from an eccentric, the shaft of which carries a gear wheel that is driven by a pinion which is to the wheel as one to six. The lever from the eccentric does not engage with the toggle joint at its center, but by a connecting bar above the center, thus giving greater leverage than by the ordinary method. *Scientific American.*

A New Furnace Device.

If all that is claimed for the following process is true, it must prove a most important invention in connection with the iron industry—perhaps the most important since Bessemers invention for making steel. As yet, however, it has only been used at Joliet. Many inventions of this nature, which were full of promise at the start, have proven in the end utter failures. We give the paragraph as we find it in the *Stove and Hardware Gazette*:

According to recent advices the "themogen" process of heating furnaces, which does away with the use of coal gas, has just been pronounced satisfactory at the Joliet, Ill., Iron and Steel Company's rolling mill, after a trial of several weeks, and it will be exclusively used in that mill in the future. It is simple and very cheap, enabling six men to do the work of sixty, and saving enormous coal bills. The "thermogen" consists of an oblong cylindrical apparatus, four feet in length and two feet in diameter. It is placed over a furnace four feet square and seven feet high, and when in use it is kept in a cherry red heat. A crude petroleum tank is connected with it, and the petroleum is forced by a pump through a small pipe and regulator into the heated cylinder. The vapor is conducted through steam pipes to the flues of the furnaces, where it is ignited with the hydrogen gas supplied by a large boiler. The pressure is so regulated that the most absolute safety is assured. The fuel is called vapor fuel, and is a wonderful substitute for the gas generated by a very expensive and cumbersome system of machinery, requiring many hands and immense quantities of coal, and costing $50,000. The expense of the "thermogen" and cost of operating it is mere nominal, and will not cost as much as the coal consumed in one day by the old system, while the results are said to be far better, as well as more practical.

SCREW MANUFACTURE.—The process of making screws is a very interesting one. The rough, large wire, in big coils, is, by drawing through a hole of less diameter than itself, made the needed size. Then it goes into a machine that at one motion cuts it a proper length and makes a head on it. Then it is put into sawdust and "rattled," and thus brightened. Then the head is shaved down smoothly to the proper size, and the nick is put in at the same time. After "rattling" again in the sawdust, the thread is cut by another machine: and after another "rattling" and a thorough drying, the screws are assorted by hand (the fingers of those who do this move almost like lightning), grossed by weight, and packed for shipment. That which renders it possible for machines to do all this is a little contrivance that looks and opens and shuts like a goose's bill, which picks up a single screw at a time, carries it where needed, holds it until grasped by something else, and returns for another. This is one of the most wonderful pieces of automatic machinery ever seen, and it has done its distinctive work at the rate of 31 screws a minute, although this rate is only experimental as yet. Ninety-three gross a day, however, has been the regular work of one machine.—*Philadelphia Bulletin.*

TO USE IRON CASTINGS AS A PATTERN.—A correspondent of the *Scientific American* asks that journal how to prepare the iron casting of any object to serve as a pattern for others. How to go to work to design in orthographic projection any object having warped surfaces or surfaces of double curvature, and surfaces following no law, like the helicoid, for instance. From the drawing of such an object a pattern maker is to make a pattern having certain dimensions. The journal named answers as follows: Iron patterns should be thoroughly cleaned of the sand scale by pickling with sulphuric acid one part, water four parts, for several hours; then scrub the surface with a metallic brush, or smooth the roughness of the pattern casting with files or pieces of broken grindstone. When cleaned and made ready for a pattern, it may be warmed by any means to a temperature that will melt beeswax. Rub the beeswax all over the pattern, wipe off any excess that may lodge in cavities, leaving upon the iron pattern only a very thin coat of wax. When cold it will be ready for the sand.

SCIENTIFIC PROGRESS.

An Ancient Road and Tunnel.

Recent years have been most prolific in the discoveries of prehistoric remains. Two most notable instances of that character have just come to hand. The first is the discovery of what is undoubtedly the most ancient artificial roadway that is or perhaps ever will be made known—that is, if the reports concerning it are correct. The discovery occurred in the valley of the Ancholme. Some laborers who were excavating brick earth came upon a corduroy road at a depth of some seven feet below the surface. Above the road is a stratum of six feet of clay, and upon the clay lies a layer of peat. It is known that this peat has occupied its present position for considerably more than a thousand years, a Roman road, which is still in good order, crossing it. The newly discovered track is formed of huge oaken beams, which are fastened into the glacial drift beneath by oaken pins, and it is believed by geologists who have visited the excavations that these timbers must have been laid down many thousands of years ago. The track seems to be about a mile in length, but whither it led and what was its use are questions which are scarcely likely to be solved. The geological indications would point to an antiquity thousands of years before the earliest dates of recorded history.

The second discovery above alluded to—that of a very ancient underground and artificial water, way is referred to by a cotemporary as follows:

After years of exertion, the present governor of Samos, Abyssides Pasha, has succeeded in uncovering the entrances to a tunnel of which Herodotus speaks with admiration as the work of Eupalinos and Megnira, and which, according to the same authority, was built during the tenth century B. C. The tunnel about 5,000 feet long, was intended to secure a supply of fresh water to the old seaport town of Samos, and consists of three parts. These are: The tunnel proper, 5½ feet high and 6 feet wide; a canal about 5 feet deep and nearly 3 feet wide which runs in the middle or on the side of the base of the tunnel, and the aqueduct running in this canal. The aqueduct consists of earthen pipes, each two and one fifth feet long, 32 to 33 inches in circumference, the sides averaging about 1½ inches in thickness. Every other joint has a hole, for what purpose has not yet been fully explained. Mr. Stamatiades, a Greek archæologist, believes that they were intended to facilitate the cleaning of the pipes, and to make the flow of water easier. The canal is arched over, but 28 manholes were provided to admit the workmen who were charged with cleaning and repairing the aqueduct. The tunnel is not quite straight, forming an elbow about 1,300 feet from one of the entrances. This elbow according to Stamatiades, was caused by a mistake in the calculations of the engineers, who had none of the instruments used in tunnel-building nowadays. The tunnel starts near a small water course which may have been quite a stream in olden times, pierces the mountain Kastri which was formerly crowned by the fort Samos, and ends a few hundred yards from the old town of Samos, about 10 feet below the surface. From the mountain slops to the city this subterranean aqueduct is protected by a massive stone structure, ending within the walls of the present convent of St. John. The preservation of this work—which is truly wonderful considering the imperfect mechanical resources at the disposal of its builders—for nearly 3,000 years is probably due to the care taken by Eupalinos, who in all places where the rock did not seem of sufficient firmness lined the tunnel with several layers of brick, running on the top into a peaked arch.

An Electrical Filter.

Electricity still continues to assert its usefulness in hitherto unlooked for directions. Its latest adaptation is to filtering purposes, with the view of preventing the spread of cholera and typhoid fever. A short time since a letter appeared in the London *Times*, from Dr. Dobell, on the prevention of those diseases, in which he directed attention to a method of destroying cholera and typhoid germs in drinking water by passing through it an electric current, and thereby exposing it to the influence of nascent oxygen, by which means the water would be dezymotised. Dr. Dobell would appear to have been forestalled in his suggestion by the construction of a filter by Dr. Stephen H. Emmens upon this principle. The filter consists of an earthenware vessel in which are placed porous cells containing carbon plates, the spaces between the plates and the cells being partially filled with animal charcoal or spongy iron. The plates are coupled up with the positive pole of a Leclanche battery, or of one of the company's own chromozone batteries. Alternating with the porous cells, are other carbon plates which are coupled up with the negative pole of the battery. The water is supplied into the porous cells, and passes through the charcoal or spongy iron to the exterior of the cells, and is drawn off by a tap in the usual way.

It is claimed that by this means, the water being submitted to the influence of the evolved nascent oxygen, as suggested by Dr. Dobell, the germs of typhoid, cholera, and similar diseases are destroyed, and that an end is put to the dreaded danger of death from this source.

The above is not the only application of Dr. Emmens' system. We understand that it is claimed to be available for the treatment of sewage upon even the largest scale. For this purpose the inventor constructs his purifying apparatus in the form of a conduit, divided by suitable partitions into a series of cells, through which the sewage successively flows. The electrodes take the shape of wooden cages, filled alternately with scrap iron and gas carbon; and it is asserted that by this arrangement no outside source of electricity is necessary, as the conduit itself forms a powerful galvanic battery capable of supplying an electric current for public lighting, &c. The sewage, moreover, is not only purified by the nascent oxygen evolved, but it becomes "dosed" to any required degree by iron salts, the disinfecting properties of which are well known, while the oxide of iron may be subsequently precipitated, and will carry down all suspended matter, thus leaving a clear effluent. The Emmens system has certainly much to recommend it from a theoretical point of view, and would appear worthy of trial by local authorities.

HONORS FOR AMERICAN SCHOLARS.—When the announcements were made of the honorary degrees to be conferred at the tercentenary celebration of the University of Edinburgh, some surprise was felt that American men of science appeared to be forgotten, while American physicians and theologians were selected with obvious discrimination for their academic distinctions. It is now stated that the authorities at Edinburgh intimated to several Americans devoted to science that the university would confer upon them the degree of doctor of laws if they would come and receive it, and that, in case of their non-attendance this year, they might be admitted to the honor if present on some future occasion. The list of men thus chosen may not be authentic, and we shall therefore refrain from reprinting it: but, as given to the newspapers, it includes, among others, a geologist and zoologist, a botanist, an astronomer and a philologist, every one of whom would be acknowledged in this country as a worthy representative of American science. —*Science.*

BRITISH SCIENTISTS.—The fifty-fourth annual meeting of the British Association for the Advancement of Science opened in Montreal, Aug. 27th. The weather was fine and cool. It was one of the largest and most representative meetings of the association ever held. The event was a most extraordinary one. For the first time in 53 years the association has left the British Isles. About 1,000 educated ladies and gentlemen have been drawn hither from across the Atlantic by reason of the holding of this meeting in Canada. More than one-half of these never crossed the Atlantic before. Four hundred have been weeks traveling through Canada towards Winnipeg, or threading the mazes of Western and Northwestern States and all of the Territories of the United States. After the closing of the session of the association, the visitors from abroad, almost without exception, intend visiting the meeting of the American association at Philadelphia, after which they will continue their travels, and mainly through the United States. The objective point of many is the Yellowstone region; a few will come to California and to Oregon. Nearly all will make long pilgrimages through the United States.

AN EXPLOSIVE FROM COAL TAR.—German ingenuity has produced another derivative from coal tar in the shape of an explosive for mining purposes or for fire-arms. This resultant is a mixture of saltpeter, chlorate of potash, and a solid hydro-carbon, the latter being paraffin, asphaltum or pitch. The solid ingredients are powdered and intimately mixed, and the mass is then treated with a liquid volatile hydro-carbon, such as benzine or gasolene, which dissolves the solid hydro-carbon and forms the whole into a plastic body. This cake is then rolled into sheets and hardened by allowing the liquid solvent to evaporate, the product afterwards being broken up into grains of any desired size, like ordinary gunpowder. By this method of dissolving the hydro-carbon before or after admixture with the salts, the grains become coated after drying with a water-proof surface of varnish. The new compound is only an explosive when confined in a close space. It possesses the same density as gunpowder and is very hard.

THE VELOCITY OF SOUND IN TUBES.—At a recent meeting of the Physical Society of Great Britain, Mr. Blaikley read a paper on the velocity of sound in small tubes—a continuation of experiments formerly brought before the society by the author. Mr. Blaikley, showed experimentally how his measurements were made. He found that pipes in which the upper proper tones were in harmonic order, or better still, those in which they were far removed from the harmonic order, and therefore dissonant, were best for the purpose. He had obtained velocities from the fine tubes varying from 11.4 to 88.2 mm. in diameter, the former giving 324.38 and the latter 330.13 m. per second as the velocity of sound. In free air Mr. Blaikley thought the velocity would come out 331 m. (1085.68 fect) per second. The differences of velocity for the different pipes were very regular.

Passing Events.

The telegraph has brought us news of a very serious strike among the coal miners in Pennsylvania and Ohio. The introduction of hand drills has had something to do with it, and the reduction of wages brought matters to a crisis. There have been serious disturbances, but late advices show that a state of quietness now prevails. News comes also this week of the disbandment of the Tombstone, Arizona, Miners' Union.

The Mechanics' fair in this city closes this week, after a successful exhibition. The State fair, at Sacramento, commences next week.

The business men of this city have instituted an inquiry into the causes of the prevailing depression. The committees appointed will not report until November and will doubtless suggest remedies where possible.

Mining news of any special importance is rather scant just at present. It will not be long now before proprietors in the mining regions will have to come into united quarters.

THE Sierra Grande Mining Company of New Mexico, incorporated at Philadelphia, has declared a dividend of 25c per share, or $100,000, payable on the 5th. This is the ninth dividend and the total is $860,000. The previous dividend was paid last July.

MINING dividends declared in August in this city aggregate $203,250, as against $156,000 in the same month last year.

Water in Quartz Mills.

There is no douht that the character of the water used in the batteries of quartz mills influences the process of amalgamation under certain circumstances. Water used for this purpose ought to he pure and free from mineral salts. It is sometimes the case that the water pumped from the mine itself is used in the batteries, and when this is done it is not certain that as good results will follow in amalgamation as if purer water were used. In the course of some experiments made in the New Zealand gold mines, on this subject, it was found that the character of the water influences the yield largely. They tried to find out the relative effects of the use of sea-water, rain water and mineral water. Some tailings were taken, well mixed and divided off for the several experiments. Every care was taken to insure the same conditions in working with the several waters—the same head of water, speed of delivery, etc.

The mineral water was prepared hy dissolving six grams of protosulphate of iron (crystallized) to the gallon of water, prior to use; this heing the most common and prejudicial salt existing in the shaft-water of the mines in the region where the experiments were carried out. The result showed that on the same ore, with same conditions, they ohtained when using the rain-water, 8 dwt., 17 gr. of gold per ton; with sea-water, 8 dwt., 14 gr.; and with mineral water, 6 dwt., 1 gr.

They found that the principal cause of the flouring or sickening of the mercury was the presence of sulphate of iron in the ore, and as the salt is freely soluhle in water, one way of preventing the mercury heing affected in this manner is to wash the auriferous material impregnated with the material, before working. To a certain extent when good water is used the ill effects of the metallic sulphate present in the veius, are diminished. The use of water in milling, containing any notable quantity of sulphates, acts even more prejudicially than the sulphates naturally existing in the ore itself, even were they ever so abundant.

It follows that millmen should employ the greatest quautity of good water that the incline of the copper plates will safely allow, since the solution of these metallic salts is thereby weakened, and so correspondingly less productive of harm. This, of course, where such salts exist in the ore. Unfortunately, millmen are not always in a position to use perfectly pure water, hut, hy taking proper precaution, much loss and trouble will he prevented.

Primitive Gold Washing.

The gypsies of the Bannat in Austro-Hungary, in washing the gold from the sands of the rivers and plains, still use a very antiquated system, out of which, no doubt, the modern systems have grown. It is practiced now hy the gypsies, as it was hy the Romans in the same country. It consists in nothing more than pouring the sand, mixed with water, over an inclined plane, the heavier particles of the gold remaining upon the surface, while the light impurities are washed away. Sometimes the inclined plane is covered with woolen cloth, to which the gold adheres; wanting the cloth, the gypsies now and then use for the same purpose the more ancient substitute of a fleece. The manner of collecting gold dust on sheep's fleeces, upon inclined planes, is represented in the curious old work of Agricola.

In the rivers of Colchis the custom is still retained of placing sheep skins in the beds of the Phasis and other auriferous streams to collect particles of gold; hence, the dedication of such fleeces to the Gods, and the fabulous history of the Argonauts, as far as it related to the Golden Fleece.

The more common manipulation among the gypsies of Eannat, as far as the gold washing is concerned, is performed by means of a plank of lime tree, six feet long, and au inch and a half thick. At the upper extremity is a small trough, and across the hoard are about a dozen grooves or furrows cut in the wood. The plank is set at an angle of forty-five degrees. The sand is put into the trough at the upper end, and thence, by plenty of water, washed down the sloping board. The gold dust falls into the grooves, whence it is scraped or brushed off. It might be supposed that a great deal of gold is lost by the careless method, hut loug experience has made the gypsies very expert; they know how to distinguish the rich and poor sand and a careful examination of the tailings proves that hardly a particle of gold escapes them during the operation. The gold is in the form of a fine dust; the sand containing it is mixed with black particles of highly magnetic iron, garnets and mica.

The Fair.

The Mechanics' fair which closes this week has heen a very successful exhibition in every way. It has accomplished a very valuable result in showing the thousands of visitors how varied are our industrial resources, and how many things we use are made in our midst. They see hundreds of things which our own citizens manufacture, and are ahle to recognize the fact, by ocular proof, that our home-made articles are decidedly worthy of patronage. Carriages, wagons and vehicles of every description are there to choose from. Brass goods of all kinds shine resplendant. Iron in the ore, in the pig and made up into all conceivable shapes—nails and tacks, saws and sawyers tools, etc. There are pianos and organs made here, musical instruments of various kinds. Art castings, wire goods, safes, cutlery, wood and iron making machinery, pumps, harness, boots and shoes, mantles, hells, gas fixtures, drills, furniture and a thousand and one things we use in daily life.

On one hand is a grand array of heautifully made vehicles, and on another a glittering pile of glassware of all shapes and colors. Near by is a wondrous display of floral heauties, arranged in attractive and unique designs. Then agricultural machinery, windmills, washing machines, lamps, woodenware utensils, household appliances of all kinds, and articles of luxury and ornament. There are hoys and girls making cigars and showing how they practice their trade; and then machinery which shows how beautiful embroidery work is accomplished with hut one guiding hand. All the many appliances used with horses are shown in a group; and near them, art materials, pictures, ornamental glass—stained and white. Then there is the art gallery, with its treasures so gratifying to the lovers of the beautiful, and which is thronged day and evening.

Each of our local artisans and dealers displays to best advantage his products and his wares, and to those persons who are his daily customers. New inventions, new appliances, old things in new form, are seen on every side. Articles for use or ornament abound in profusion, and no man can wander among the displays without learning something or seeing new things. The crowds themselves are worthy of study. There the capitalist, the elegantly-dressed lady, the solid citizen, the merchant, the mechanic, artisan and the laborer, all mingle freely, engaged in the same pursuit—an indulgence of curiosity. The galleries are crowded with gayly-dressed multitudes, while the more thoughtful stroll slowly through the aisles and listen to the explanation of the various articles hy the exhihitors.

It would be idle to attempt to go into details of the various exhihits, and it is of the fair as a whole we write. These annually recurring exhihitions are a powerful factor in the industrial education of a progressive people. They teach others what the producing classes are doing, and how they do it. They show people tools and appliances for carrying on work, with only the products of which they are generally familiar. They create an interest in industrial pursuits and hring producer and consumer closer together. They bring forth a spirit of honorahle emulation among artisans and mechanics, and result in hetter work, more careful attention to details, and more artistic designs. Each advancing year shows improvement and variety in our local industries, which evidences also progress among the people themselves who are engaged in them.

MR. HENRY E. MATTHEWS, Secretary of the Lick Trust, who is a skilled amateur photographer, has taken some very fine views of the interior of the Mechanics' pavilion. Mr. Matthews has a creditable display of his photographs in the fair, among them some pictures of the Lick observatory at Mt. Hamilton, some marine pictures, etc.

THE Society of California Pioneers will lay the corner-stone of their new huilding on Admission Day—September 9th.

A New Electrical Apparatus.

Dr. James B. Williams at No. 759 Market street in this city, the inventor and maker of the large electro-medical apparatus which was illustrated and described in this paper in March 1881, and which was considered both here and in the East as the most complete apparatus of the kind ever made, has recently completed a new and improved apparatus for removing cancers, tumors, fistulæ etc., by the aid of electricity, without the use of knives, scissors or needles. It consists of three separate generators, all contained in the same case, which may he used either singly or in combination, depending upon the quantity or tension of current required to effect the removal of different sized growths. It also embraces several improvements not hitherto used in any similar apparatus, the most important being the "switch system" for regulating and controling the currents, and the exciting fluid for the generators or piles. The switch system is very perfect in its action, enahling the operator to have *instantaneous* control over the current, and also permitting the "resting" or "alternating" of the plates, which, together with the peculiar properties of the exciting solution used, does away with the disagreeable effects of polarization, without the use of "agitators" or "air-tubes."

The apparatus is supplied with electrodes of an entirely new pattern, for applying the current to external growths, as well as to growths situated in portions of the hody where the use of the knife would he attended with danger.

The advantages of operating by the use of the electric current in certain cases over those of the knife have been fully demonstrated, the principal objection heretofore existing being that very little dependence could be placed upon the efficiency of the apparatuses, and which may be briefly enumerated as follows:

Entire removal of the growth operated upon. Absence of hemorrhage during the operation, the mouths of all the hlood vessels heing completely occluded. Rapidity of operating. In many instances, such as removing the tongue, hemorrhoids, the destruction of fistulæ, etc., occupying from a half to two or three minutes only. No danger of septicæmia, or hlood poisoning, there heing no open vessels remaining to absorb morhid material. No destruction of tissue other than that operated upon, as the current is confined entirely to the electrodes, and does not enter the hody at all. Very little shock, if any, to the nervous system. Ready portability of the apparatus, thus enahling parties to he operated upon at their own homes.

The apparatus is not only quite simple in its operation hut is exceedingly ingenious in design. Dr. Williams made the whole apparatus with his own hands, and has heen upwards of a year engaged upon it. The instruments which are used in the connection with the battory are of peculiar design and had to be made specially of course. These also, Dr. Williams made himself.

THE INTERNATIONAL ELECTRICAL EXHIBITION at Philadelphia opened on the 2d inst. The Edison, United States Brush and Thompson-Houston companies will have 350 arc lights and 6,000 incandescent lights. Of the latter 3,800 are those of the Edison Company, 1,200 of the United States Company and 1,000 of the other companies. There are five classes of apparatus for the production of electricity, including all kinds of electric generators. The electric conductors alone require seven distinct classes, in each of which are many exhibits. There will be electric telegraphs, telephones, microphones, fire and burglar alarms, annunciators, electric clocks, time telegraphs, registering and signaling apparatus, applications of electricity in dentistry, surgery, warfare, mining, blasting, spinning, weaving, traps, snares, pneumatic apparatus, writing, printing, musical instruments, conjuring apparatus and toys.

A FEW days ago Mr. Day, engineer at the Day furnace, Pioche, Nevada, was down the well repairing the pump, when an explosion occurred in the bottom, and a white vapor instantly arose from the water, accompanied by the pungent fumes of ammonia, which nearly strangled Mr. Webster before he could regain the surface. The white ammoniacal vapor is still arising from the well, and is as pungent as an old-fashioned hartshorn smelling hottle.

IT is stated that a single blast on Telegraph Hill, in this city, one day this week, loosened about 8,000 tons of rock. The material is being used in forming a seawall.

The New Pavilion at Sacramento.

This year's State fair will be the first in the grand new pavilion erected last year by the combined enterprise of the State at large and the city and county of Sacramento. The engraving on this page gives a good view of the handsome structure. During the next two weeks it will be a center of attraction for the people of the whole State and the many who are sojourning amongst us. Its interior will be well filled with what will, in all probability, prove the grandest collection of California products and manufactures and art treasures ever made.

As this will be its first employment for the purpose for which it was constructed, a sketch of its history and a few notes of its dimensions and leading features will be acceptable, no doubt, both to those who attend the fair and to those who remain at their homes.

The State Agricultural Society for several years agitated the question of a new exposition building. The society, being under supervision of the State, the Board of Directors deemed it proper to advise the construction of a State agricultural and industrial expositiou building upon the State capital grounds. A conference was held with the Sacramento Board of Trade and it was agreed that the city of Sacramento should be asked to subscribe the sum of $30,000, and the county the proceeds of sale of the old pavilion, to aid in the erection of this grand structure, provided the State could be induced to appropriate a like amount. At the convening of the Legislature the Sacramento delegation, consisting of Senators Cox and Routier, and Representatives Larue, Doty and Ryan, agreed to the introduction of a bill appropriating the desired amount. After considerable delay, the bill finally passed both Houses, and was approved by Governor Stoneman March 9, 1883.

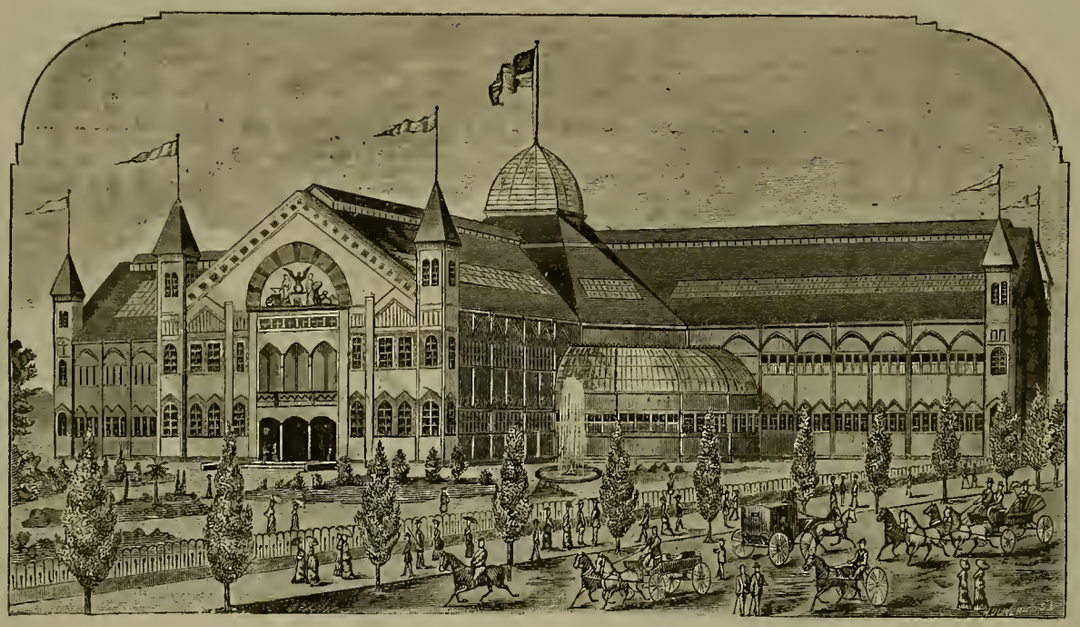
At the city election, held in March, 1883, the question of a special tax for new pavilion purposes, to raise $30,000, was submitted to a vote of the people of Sacramento, who decided by a vote of 3,655 in favor of, to 102 as against the proposition. A special levy of 30 cents on each $100 was made, and the $30,000 collected and paid into the treasury, together with $10,000 raised by the Directors, making $40,000—an amount equal to that appropriated by the State. The Board of Directors immediately advertised for plans, offering as a premium the sum of $300 to the successful plan. After considerable discussion and balloting, a design by A. W. Burrell, of San Francisco, was adopted. The contract was awarded to R. McKillican, of Oakland, for $74,363.

On the 5th day of June the corner-stone of the new building was laid under the direction of Grand Master Clay W. Taylor, of the Grand Lodge of Masons.

On the 22d day of January, 1884, the building was formally accepted from the contractor as completed, the time occupied in building this immense structure being eight months and six days. The building, as completed, contains 980,000 feet of rough lumber, 78,000 feet of rustic, 35,000 feet of wainscotting, 160,000 feet of flooring, 1,000,000 shingles, 56 tons of wrought iron, 12 tons of cast iron, 50,000 pounds of nails, 39,600 square feet of glass, 12,000 feet of gas-pipe, and 2,000 gas burners, including the art gallery jets. About 10,000 extra bolts, over and above those specified, have been used in the construction of the building.

The dimensions of the building, as it now stands, are as follows: From ground to top of flag-pole, 160 feet; from floor to peak of main trusses in dome, 108 feet; hight of dome, 40 feet; hight of towers, 88 feet; from ground to apex of roof, 80 feet; from the ground to eaves of building, 50 feet. As an extra precaution, lateral rods have been placed between each set of trusses, thereby tying the entire roof together. There is a rod of iron encircling the building on top of wall plates. The main building rests upon posts in each wing, set 28 feet apart, resting on piles driven 30 feet and capped with concrete. The dome rests upon four main posts, weighing six tons each, set upon three piles driven to gravel and capped by an 8 foot concrete base. The entire lower floor rests separately on 678 brick piers, set in cement, and is not attached in any way to the walls of the building. The 8-inch brick wall that fills in the space between the main posts merely supports six feet of the floor joist. The area of the building is as follows:

	Square feet.
Music hall	45,000
Horticultural hall	12,000
Machinery hall	12,000
Industrial hall	12,000
Art gallery	12,000
Conservatories	12,800
Promenade galleries	17,000
Total of floor space	124,800



STATE FAIR INDUSTRIAL AND AGRICULTURAL EXPOSITION BUILDING AT SACRAMENTO, CAL.

An executive session of the Board of Trade was held this week, to consider the depressed condition of affairs in this city and to provide some means to improve them. After a long conference a committee was appointed consisting of the Presidents of the Board of Trade, the Merchants' Exchange and the Manufacturers' Association, who are to be examined thoroughly into the causes that have produced the great depression in trade, and to suggest a remedy. They will be expected to hand in their report on the 17th of November next.

The largest dredging machine in the world has been finished at Potrero Point, and will be used on the Sacramento and San Joaquin swamp lands. She has been named Thor, and modeled after the best dredges now in use by De Lesseps on the Isthmus Canal, cutting out a channel and building a levee at the same time. The Thor is 101 feet long and 61 feet wide, and has 34 iron buckets, with a capacity of 1½ cubic yards each, which can be filled and emptied fourteen times per minute. All the machinery was manufactured in this city, and the timber is of Oregon pine.

The steamer *Barnard Castle*, from Departure bay, reports that the prospects in the new shafts of the Wellington mine property are much more favorable than the reports by telegraph would indicate. The new seams are about a mile and a half southeast from the mine proper, and show a fine quality and the best prospects for an abundant supply.

The public debt statement confirms the belief that the Treasury will not be compelled to resort to silver in settlement of clearing house balances: Gold coin and bullion has increased in the Treasury from $119,000,000 to $122,500,000. This increase is expected to continue during the fall months.

A gold quartz mine in Australia has paid to stockholders $2,685,000, in dividends, on a paid-up capital of $140,000.

New Milling Machines in Oregon.

During a recent visit to the Union Iron Works, Portland, Oregon, our agent was shown two machines of local invention that are worthy of mention in the PRESS. One was an ore and rock-breaker, the invention of Mr. E. W. Jones, the Superintendent of the Works. This machine is constructed upon a different plan from that of the ordinary rock-breaker. The main casting lies in a horizontal position, and is hinged upon a pivot at the back of the machine. It receives both a perpendicular and lateral motion by its other end revolving upon an eccentric, or small crank. A triangular shaped die, firmly set, at an adjustable angle, projects through a central cavity of the main castiug, and presents its two sides to the crushing surfaces of the moving crusher. This arrangement produces a variety of crushing movements at each revolution of the crank which gives motion to the machine, and an economy of power and time is effected which renders the breaker very effective and rapid in its work. The machine examined has a capacity of crushing from twenty to thirty tons of ore per day. If desired it pulverizes the rock almost to powder, and reduces the work of a quartz mill to a minimum. The other machine spoken of is a quartz mill invented by Mr. Salmon, and built by the Union Iron Works. Its peculiarity is a combined grinding and stamping motion, obtained by a revolving ring of stamps playing or moving within a proper casing or pan, motion to the stamps being given by a perpendicular shaft carried around upon the periphery of a 15-inch wheel suspended above. Thus the circular casting tips and revolves, much as a barrel might be made to tip upon its chime. Each of the stamps on the bottom of the circular ring presents a surface of 32 square inches to the die in the bottom of the pan. The combined weight of the stamps is 1,000 pounds. The sides of the pan are provided with screens for the exit of the crushed ore (water, of course, being used in reduction process) and what gold or precious metal is not amalgamated in the pan is saved by properly treating the pulp that escapes through the screens. The claimed advantages of this quartz mill are: Economy of power in running; thoroughness of the reduction of ore; and cheapness compared with stamps of like capacity. In conjunction with the rock-breaker above described, the mill has a capacity of seven to ten tons per day. We are promised perspective and detail cuts of these two machines, accompanying which we shall be able to present a more lucid description of their commendable features. Their invention and manufacture shows that Portland is awake to the interests of the mining industry which is becoming more naturally tributary to it than formerly.

The third annual exhibition of the National Mining Industrial Exposition, under the auspices of the Denver Chamber of Commerce, was formally opened in that city yesterday.

Electric Amalgam.

A company has been incorporated under the laws of the State of Maine, called the Electric Amalgam Company, which now owns the A. S. Hinckley patent. They manufacture what they call "electric amalgam," a compound which, it is claimed, will greatly assist amalgamation in gold and silver milling. An analysis by Torrey & Eaton, sent to Dr. John H. Rea, the agent, 7 Exchange Place, Boston, Mass., shows the sodium (electric) amalgam to contain two and one half per cent of sodium. They say, "We have used ten parts of common quicksilver on a small quantity of free gold ore and extracted five ounces per ton." By using eight parts of common quicksilver and two parts of the amalgam they extracted at the rate of thirty-six ounces per ton. It is claimed to be a simple and economic use of electricity for the purpose of increasing the activity of the quicksilver, keeping it bright and active.

The circular of the company states that electricity is stored in the quicksilver until the fluid mercury becomes a hard amalgam, similar to Wurtz's sodium amalgam, but differing in time, action and result. A small pellet of the new amalgam will last from 30 minutes to two hours. For pan or silver amalgamation, by using eight to ten ounces of the ordinary amount of quicksilver at the commencement, and using for the other two-tenths one pound of electric amalgam, dividing it into four parts, and feeding it at four equal installments, positive electric action will be had during the entire time the pulp is in the pan. There is no alteration of machinery necessary. The pellet or piece of amalgam is simply dropped in the mortar, pan or sluice box. It is claimed also that it will take up and amalgamate dirty or rusty gold. For preparing copper plates the instructions are as follows:

Wash the surface of the plate with a *weak* solution of *cyanide of potassium*, or soda, to remove any dirt, oil, or grease; take one or more ounces of mercury, add one-fourth the amount of electric amalgam, and mix thoroughly; take a piece of chamois skin, by preference, or a thin, soft rag, and rub in the mixture of mercury and amalgam on the plates. Five minutes will prepare a plate, even if entirely new.

Receipts of quicksilver at this port in August were 1,590 flasks, against 5,940 flasks for the same month last year, and 4,194 flasks for the same month in 1882. The deliveries last month were the smallest this year. The total for the first eight months is 17,975 flasks, against 32,120 flasks for the same time last year, and 30,609 flasks for the same time in 1882. Several of the mines in operation a year and two years ago have been closed down, and there is decreased product among the half-a-dozen in operation.

W. H. Cook will soon visit Los Angeles county in the interest of different papers published at this office. Mr. Cook has been a school teacher, comes well recommended, and from several months' connection with this office we do not hesitate to commend him to all whom he may meet, believing his efforts will be mutually beneficial to the papers and individuals, etc.

The first through train to Delta, on the California and Oregon railroad, left this city on Monday, and trains and stages and trains beyond that point are now running regularly, and this makes an overland route from here to Portland. The time required for the journey is about two and one-half days.

A large English party are now at the Trinidad, Mexico, and have the sale nearly completed of those mines at $1,500,000 cash. Brown Bros. & Co., of London, representing the English purchasers.

Vat Process for Silver Amalgamation.

From a paper by Edgar P. Rathbone, read before the Cardiff meeting of the British Institute of Mining Engineers, on the Francke "tina," or vat process, for the amalgamation of silver ores, we make some interesting extracts, omitting that portion relating to the ore dressing and roasting. The process is the invention of Herr Francke, a resident of Bolivia. It has, by its satisfactory working, entirely eclipsed all other plans hitherto tried in Bolivia, Peru and Chili. The Francke "tina" process is based on the same metallurgical principles as the system described by Alonzo Barba in 1640, and also on those introduced into the States in more recent times under the name of the Washoe process.

From the furnaces the roasted ore is taken in ore cars to large hoppers or bins, situated immediately behind the grinding and amalgamating vats, locally known as "tinas," into which the ore is run from the bin through a shoot fitted with a regulating slide. The tinas or amalgamating vats constitute the prominent feature of the Francke process. They are large wooden vats, from 6 to 10 feet diameter, and 5 feet deep, capacious enough to treat about 2½ tons of ore at a time. Each vat is very strongly constructed, being bound with thick iron hoops. At the bottom it is fitted with copper plates about three inches thick, and at intervals around the sides of the vat are fixed copper plates, with ribs on their inner faces, slightly inclined to the horizontal, for promoting a more thorough mixing. It is considered essential to the success of the process that the bottom plates should present a clear rubbing surface of at least 10 square feet. Within the vat, and working on the top of the copper plates, there is a heavy copper stirrer or muller, caused to revolve by shafting at the rate of 45 revolutions per minute. At Huanchaca this stirrer has been made with four projecting radial arms, but at Guadalupe it is composed of one single bell-shaped piece, without any arms, but with slabs, like arms, fixed on its under side, and this latter is claimed to be the most effective. This stirrer can be lifted or depressed in the vat at will, by means of a worm and screw at the top of the driving shaft. The bevel gearing is revolved by shafting connected with pulley-wheels and belting, the wheels being three feet, and one and one-half foot diameter and six inches broad. The driving engine is placed at one end of the building. Each vat requires from two and one-half to three horse-power, or, in other words, an expenditure of one horse-power per ton of ore treated. At the bottom of the vat, and in front of it, a large wooden stop-cock is fitted, through which the liquid amalgam is drawn off at the end of the process into another shallow-bottomed and smaller vat. Directly above this vat there is a water hose, supplied with a flexible spout, through which a strong stream of water is directed upon the amalgam as it issues from the grinding vat, in order to wash off all impurities.

The following is the mode of working usually employed: The grinding vat or tina is first charged to about one-fifth of its depth with water and from 6 to 7 cwt. of common salt. The amount of salt required in the process depends naturally on the character of the ore to be treated, as ascertained by actual experiment, and averages from 150 to 300 pounds per ton of ore. Into this brine a jet of steam is then directed, and the stirrer is set to work for about half an hour, until the liquid is in a thoroughly boiling condition, in which state it must be kept until the end of the process. As soon as the liquid reaches boiling point, the stamped and roasted ore is run into the vat, and at the end of another half-hour about one cwt. of mercury is added, further quantities being added as required at different stages of the process. The stirring is kept up continuously for from eight to 12 hours, according to the character and richness of ore. At the end of this time, the amalgam is run out through the stop-cock at the bottom of the vat, is washed, and is put into hydraulic presses, by means of which the mercury is squeezed out, leaving behind a thick, pulpy mass, composed mainly of silver, and locally termed a "pina," from its resembling in shape the cone of a pine-tree. These "pinas" are then carefully weighed and put into a subliming-furnace, in order to drive off the rest of the mercury, the silver being subsequently run into bars. About four ounces of mercury are lost for every pound of silver made. The actual quantities of mercury to be added in the grinding vat, and the times of its addition, are based entirely on practical experience of the process. With ore assaying from 150 to 175 ounces of silver to the ton, 75 pounds of mercury are put in at the commencement, another 75 pounds at intervals during the middle of the process, and finally another lot of 75 pounds shortly before the termination. When treating "pacos" or earthy chlorides of silver, assaying only from 20 to 30 ounces of silver to the ton, 36 pounds of mercury are added to 2½ tons of ore at three different stages of the process as just described. The rationale of the process therefore appears to be, that the chlorinization of the ores is only partially effected during the roasting, so as to prevent the formation of injurious salts, and is completed in the vats, in which the chloride of copper is formed progressively as required, by the gradual grinding away of the copper by friction between the bottom copper plates and the stirrer; and this chloride, subsequently becoming incorporated with the boiling brine, is considered to quicken the action of the mercury upon the silver.

Wood River Mining.

A Salt Lake *Tribune* reporter had the pleasure yesterday of meeting Mr. Shaughnessy, who is largely interested in Wood River, and has lately spent some time there. He looks upon that country as being a splendid mining district, and says we hear less of it this year than last, because the ores go to Omaha instead of coming here as formerly. He shows his faith in the country and mines by putting money in the development of his various mining properties there.

The Eureka mine, owned by him and Col. Wall, is to have the finest plant in the way of hoisting works, compressors, and concentrating mill in the West. Contracts have been let for the machinery, and the Eureka is to be worked from this on both winter and summer by a large force of men. The Eureka is known to be on the same ledge with the celebrated Idahoan, located on the east and worked from the opposite side of the ridge. The vein is a large one, and yields a fine grade of first-class ore, besides a large amount of concentrating ore. The mine is located up Eureka gulch, only a short distance above the town of Bullion. Across the gulch, on the same belt of mineral, are the Bates and Boyd mines, which are now producing well; beyond which is the Bay State group, owned by Messrs. Shaughnessy and Wall. The ledge has been cut by a 400-foot level, at a depth of about 400 feet, and they have commenced to take out ore.

Mr. Shaughnessy, one or two years ago, purchased the Emma mine, joining the Solace near Vienna, and upon this he is doing much work. The ore being extracted from the mine is very high grade milling ore, ranging from 300 to 500 ounces in silver. He is having boarding-houses, shops, etc., constructed and is laying in a quantity of necessary supplies for doing work through the winter, and will employ from twelve to fifteen men. In that locality mining underground is conducted to best advantage during the winter season, after ample preparations have been made. At that season the ground is free from water, and miners have no trouble from this source.

Private Letters from Bellevue,

Idaho, report a rich strike in the tunnel of the Queen of the Hills. The vein is the full width of the tunnel, and the ore is four feet wide, upon which drifting still continues, the workmen taking out ore only the size of the tunnel. This tunnel taps the veins at a point lower than any workings in the Wood River country, proving conclusively that the ledges there go down to great depths, and it is probable that the Queen of the Hills will prove as large a mine as any in that country. The machinery of the new concentrator has been tried and works splendidly, and the mill will be in full operation within a few days.

From the same source we learn that a good strike has been made on the Overland and that hoisting works have been erected on the property. The above mines are chiefly owned by Utah men, and we are pleased for their sake that the properties are promising so well.

Chinese Miners in Upper Columbia.

The Kittitas *Localizer* (No. 7) says: There are nine Chinese miners working a very profitable claim on the west bank of the Columbia, eleven miles above the mouth of the Wenatchie. Their average daily pay is $1 50 to the miner. The claim has been worked by them for the past twelve years.

There are two Chinese miners at work on the best paying Columbia river bar, opposite the Nez Spielum country. These miners are independent of any organization and are wealthy. The writer saw them take out ten dollars on a two day's wash by their improved Chinese process. They are protected by the Nez Spielum Indians, in whose interests they labor, and from whom they purchase their supplies.

Both banks of the Columbia are good for gold deposits, and are worked by Indians and Chinese throughout the entire length of bars, from the Nez Spielum to the San Poel.

There are five Chinamen at work on the east bank of the Columbia, opposite White Stone reserve. They too are independent and doing as well as the others. Frank Frielander has recently entered this claim, and has it recorded as the White Stone mining district.

There are twenty Chincse miners at work between Hawk creek and Camp Spokane, on the east bank of the Columbia. This is an old, well-paying claim, with very valuable deposits of fine gold in direct wash from the Coeur d'Alene and Spokane rivers. No paying bars north and east of the Spokane.

On the Rock creek mining district, near Kettle river, and between lake Sooyoos and Kettle falls, near the British Columbia line, there are nearly 200 Chinamen at work, with Indians and other old frontier miners. This is an old mining district, equal in extent to that of the Kootenai country. Average daily pay, about two dollars.

The Similkameen mines are resting; no machinery, and no capital to develop them.

The Martin White Mine.

From the report of the Superintendent of the Martin White mine, Nev., for the year, we take the following extracts:

During the past year our explorations have been confined mainly to the southerly portion of the lead, on and above the 160 level, partly in what is known as the F. F., from the upper workings of which a raise was run through the Truscott ore body to the surface. In doing so we extracted a fair amount of ore of very good grade.

Considerable prospecting was done along the lime wall under this body, and some veins of high-grade ore were encountered.

Owing to the immense amount of snow which, melting, so flooded this part of the mine, the work was necessarily suspended until the ground became settled.

Prospecting was then resumed on the 160 level in another part of the mine not so affected by the water, and some good ore was extracted. The most of these developments were of a very encouraging nature.

In all there was run during the year about 1,450 feet of drift, 170 feet raise and 60 feet of shaft. In doing this we extracted about 250 tons of ore of about the assay value of 41.32 ounces in silver per ton.

The past year, although by no means barren of good results, has been one of disappointments and misfortunes (in a small way).

The F. F., notwithstanding our best efforts to prevent it, closed up from the great weight of the thoroughly soaked ground. The drift from the cave on the surface also closed up, thus shutting off all communication with the body. The body itself, from the giving way of the worked-out ground underneath in some places, caved to the surface. These misfortunes necessitated the running of a new drift from the surfaces. This drift will tap the east drift in about 150 feet.

The chamber around the top of the main chute, from the unusual height, also gave way.

I have done a large amount of repairing and timbering, as the old timbers were constantly giving way. I now have the mine secure, and not much re-timbering will be necessary for some time probably.

Buried in a Mine.

W. T. Newberry, who has been running a tunnel in Blue Point ravine, about one mile and a half from the Mountain House, on the Forest City road, had a miraculous escape from death recently. Newberry has been working alone in the tunnel, which is in a distance of some fifty feet. He started out to work and his failure to return in the afternoon was overlooked by those around the Mountain House, and it was not until the return of Dan Cole in the evening that his absence was thought of. Finding that Newberry had not been seen since the morning, Cole dispatched a man to the tunnel, who returned with the information that the tunnel had caved. On receiving the news, several men started for the scene of disaster, while a telegram was sent to Forest City asking for help. The request was promptly responded to, and a number of men with the necessary implements were soon on the ground. The tunnel had been poorly timberd, and the whole top from near the mouth to the face had come down, as was evident from the appearance of the ground on the surface. The work of opening the tunnel was necessarily slow and was anything but a safe place to work in, as the ground was broken to the surface. However the men kept steadily at work.

About 2 o'clock the following afternoon the men were rewarded by hearing the voice of Newberry. Work then went on with renewed energy and shortly after 3 o'clock the imprisoned men was rescued from his perilous position.

The debris from the cave extended right up to where he stood. Newberry was very weak and somewhat dazed when taken out, but aside from this he was all right. He reported the tunnel to have caved about 10 o'clock Saturday morning, so that he was imprisoned about twenty-nine hours. He says that he heard the workmen as soon as they commenced to work, but could not tell whether it was rescuers or more caving of the tunnel.—*Downieville Tribune.*

THE FARRINGTON MILL.—Work upon the new mill of Farrington & Moss, situated about eight miles from the mines in Garfield district, in this county, has progressed so far that the machinery will be in operation within a short time. It is learned from one who is competent to judge of the methods of reducing the ores of this part of the country, that the little mill of five stamps will be the most complete ever erected in this State. Only the most modern and best working machinery has been put in, and not a shovelful of the ore will be handled from the time it enters the rock-breaker until placed in the pans. Besides, the machinery is all so closely connected but a small force of men will be required to operate it. Ample precautions have been made against fire by a system of pipes extending all over the building, and a sufficient supply of water is conveniently near at hand. There will be plenty of wood, which can be delivered at the mill for from $4 to $5 a cord.—*Candelaria True Fissure.*

ARIZONA MINES.—The Prescott *Courier* says: We can think of no better advice to give to owners of promising mines than to keep on developing them. If owners cannot have their ores treated at home, they can ship the richest of them and save the remainder, for future reference, so to speak. There are in Humbug, Black Canyon, Tiger, Turkey Creek, Hassayampa and, in fact, all other districts of the county, bodies of rich ores that can be mined and shipped at a profit, and it is to such mines we now look for pay. In proof of this assertion, we can point to the Pine Spring, the Holmes, Blue Dick, Mark Twain, and Dosoris mines; also to a great many others, notably those near the Tip-Top. Could we but procure and publish results of milling and smelting in this part of Arizona, the figures would be very satisfactory, but those who have done well, and are doing so now, do not "hanker after notoriety." These are the United Verde company, the Black Warrior company, Kimball company, Chicago company. We might save others, but the foregoing will answer every purpose. We have, in reserve, the Bradshaw Basin mill, which Bond & Hayden are fixing for work; and the Del Pasco. There is talk of erecting general reduction works in Copper Basin.

THE OLD TRENCH MILL.—Theodore Vinson, of Silver City, was in town yesterday. He has long been engaged in cleaning up and working the debris at the site of the old Trench mill, but the work is now drawing to a close. A great deal of valuable material was found. The mill was started up about twenty-three years ago, and some idea of the amount of slopping and drippings of quicksilver and amalgam that would accumulate in the ground and all about the place in that length of time may be formed particularly by millmen. There in the early days they were rather "slushy" at best, and much addicted to processes and experiments of all kinds. In front of the old Trench we have seen them for months roasting the rich ores of the Comstock on log heaps, and they were wont to dose the pans with teas made of cedar bark and sagebrush, salt by the bushel and blue-stone by the peck. *Virginia Enterprise.*

A NEW SLUICE-BOX.—Messrs. Bacon and Cooper, the two well-known assayers, left this morning for their claim on Snake river, about 15 miles from Bliss railway station, where they will start work at once. They took along with them a new kind of amalgamator, for which a United States patent was issued May 27, 1884. This new amalgamator is a sluice-box, having opposite riffles faced with copper plates that can be amalgamated, and, when necessary, connected with wires leading to a generator of electricity. The riffles are so placed as to cause counter-currents, and to throw every part of the matter passing through in contact with the plates. The amalgamator has been tried at the Ontario mill and elsewhere, and is highly extolled by all mining men who have seen it. If it works half as well as it is expected, it will solve the problem of how to save the flour gold of the Snake river placers.—*Wood River Times.*

A GOOD FIND.—The Elko *Independent* says: Thomas Schaffer, of Tuscarora, who had been here some eight or ten days, was joined by William Hoar, who came down by stage on Saturday evening, and they together started by the train Sunday morning for Beowawe, from which place they go to examine an old mining claim located by Schaffer several years ago, some ten miles east of the present camp of Frisbe, and situated in the Toiyahe range. Schaffer says that in the claim mentioned he uncovered an eight-foot vein of mineral bearing quartz which gave assays all the way from $19.50 to $800 per ton, the average value being very high. Schaffer showed us a sample of a very handsome piece of ore from the lead in question, and if the miner's enthusiasm has not warped his judgment, the claim will develop into something exceedingly valuable.

ANOTHER MEADOW LAKE REVIVAL.—The Sierra Valley *Leader* says H. H. Hartley, the present inhabitant of the once famous Meadow Lake mining district, was in the valley last week, and made contracts for lumber with which to erect a new quartz mill with improved machinery in that district. Mr. Hartley has been in Meadow Lake for nearly twenty-five years, and has an abiding faith in that country. Rumor says he has been successful in his persistent efforts and has made money of the country, so that he now intends to put up a mill on his own responsibility and on his own plans, which, by practical experience, he is satisfied will work the refractory ore successfully.

ANOTHER POSTAL IMPROVEMENT.—In order that Eastern mails may be delivered in this city an hour earlier than at present, seven postal cars have been refitted so as to facilitate the work. When each western bound train arrives at Sacramento, two postal clerks sent up for the purpose will board the postal car and distribute the San Francisco mail according to street and number, so that it can be turned over to the carriers immediately upon its arrival. This arrangement will go into effect as soon as the cars have been completed.

ENGINEERING NOTES.

One Hundred and Forty-seven Miles Without a Stop.

The New York Central and Hudson River Railroad is running special newspaper trains to Albany. A large engine has recently been fitted up on that road for fast trains. It has also had a new device attached to the furnace for consuming its smoke. The smoke consumer is very simple, consisting merely of two pipes, one in front of the fire-box, and one in the rear, each of which admits jets of steam into the flames rising from the burning coal. The steam effects perfect combustion, and while completely consuming the smoke, makes a gain also in the heat obtained. Usually, when the fireman is throwing in coal or stirring the fire, and for a few moments after each operation, a cloud of smoke pours from the chimney of the locomotive. In the whole trip to Albany nothing that was visible came from the chimney except the escape steam. The improvement was wonderful, and the Central officials seem to be justified in feeling that they are a little ahead of the rest of the world with their new device. So far only two or three locomotives have been supplied with the smoke consumers, but others are to be soon.

The trip to Albany was also noteworthy because the engine ran the whole 147 miles without stopping for water, oiling up, or anything else. The company are aiming to introduce this idea in all their fast trains. To run an engine so far without oiling requires alterations in the oil cups, etc., but all the difficulties have been overcome, and the long run was made successfully. Water was obtained by the well-known method of "scooping up" while in motion.

ANOTHER ELECTRICAL RAILROAD EXPERIMENT. A practical trial was made at Cleveland, Ohio, on the 20th ult., of an electric motor for street cars, the Brush Electric Works, in connection with the East Cleveland Railway Company having fitted up about two miles of track and attached a motor to the car. The general scheme is much like that of a railroad, the electricity being conducted through rods laid in a trough in the center of the tracks. A lever reaches down in the center of the track into this trough and attaches to the electrically charged rods. The experiment was considered a success, the car moving off at the first swing of the lever. There seemed to be some stiffness in the machinery, but this, it is claimed, will be overcome. The railroad company state that they expect to at once apply the motor to the whole line. It is claimed that the road can be operated with electricity at one fourth the cost of working it with horses.

TRANSMISSION OF POWER BY ELECTRICITY.—One of the most remarkable instances of the transmission of power by electricity is that presented by the electric railway in one of the main cross-cuts of the Oppel colliery, Saxony. This cross-cut is 2,365 feet long, and is the outlet for the coal mined in the vein, the quantity delivered to it being 600 mine-cars per day of 16 hours, each car weighing, loaded, 1,594 pounds. A train of 15 cars is moved at a speed of from seven to 10 feet a second, the steam-engine at the mouth of the shaft making from 225 to 250 revolutions during the run, lasting from three and one-half to four and one-half minutes through the cross-cut. When doing this amount of work, the steam-engine delivered 11.2 horse-power; or, assuming the friction of the engine's gearing to have occasioned a loss of twenty-five per cent, the power actually transmitted by the electric current to the locomotive was 5.22 horse-power, or 46.6 per cent.

TWO GREAT ENGINEERING PROJECTS are about to be undertaken on the continent. The Spanish and French governments have agreed to authorize the construction of two new railways which will involve the cutting of two tunnels through the Pyrenees. The one will shorten the route between Paris and Madrid; while the other will give France speedier access to ports in the east of Spain, whence she could most expeditiously despatch relief to Algiers.

RAILWAY CONSTRUCTION in the United States continues on a very conservative basis and the new mileage thus far this year is smaller than for the corresponding period of any previous year since 1879. This shows that there is no disposition to build new roads in advance of the wants of the people, and is important insomuch as it will give the country a chance to grow up to roads already constructed.

CALIFORNIA AND OREGON EXTENSION.—The last bridge across the Sacramento river, on the California and Oregon Extension Railroad, to the new terminal town of Delta, has been completed, and it is expected that the road and all necessary adjuncts will be in running order by September 1st.

IT is stated that the Union Pacific Railroad has completed the surveys of a line to the Yellowstone national park. The route is from China Point, Idaho, on the Utah and Northern Division, to and up the Snake river, thence across the Rocky Mountains to Madison river. The distance is 275 miles.

USEFUL INFORMATION.

Silvering Iron.

A manufacturer in Vienna employs the following process for silvering iron. He first covers the iron with mercury, and silvers by the galvanic process. By heating to 300° C., the mercury evaporates and the silver layer is fixed. Ironware is first heated with diluted hydrochloric acid, and then dipped in a solution of nitrate of mercury, being at the same time in communication with the zinc pole of an electric battery, a piece of gas carbon or platinum being used as an anode for the other pole. The metal is soon covered with a layer of quicksilver; is then taken out and well washed and silvered in a silver solution. To save silver the wire can be first covered with a layer of tin; one part of cream of tartar is dissolved in eight parts of boiling water and one or more tin anodes are joined with the carbon pole of a Bunsen element. The zinc pole communicates with a well-cleaned piece of copper, and the battery is made to act till enough tin has been deposited on the copper, when this is taken out and the ironware put in its place. The wire thus covered with tin chemically pure and silvered is much cheaper than any other silvered metals.

VEGETABLE SILK.—A German technical journal gives some details as to a vegetable substance, somewhat resembling silk, to which attention has lately been drawn by its having been exhibited in Greece. It is stated that this substance is a silky haired portion of a tree like shrub, which came originally from America, but is found in Syria and the south of Europe (*Asclepias Syriæ*), of the family of Asclepiades. It is also known as the Syria silk plant. The substance in question is used for stuffing very soft cushions. When mixed with silk and wool, the Syrian silk is said to be used in different tissues. The milky juice of the plant is poisonous, and the tough stalks can be used in the same manner as the corresponding portions of the hemp plant. An English exchange, which has seen a specimen of this fiber, says: "It is certainly very beautiful, soft to the touch, and very silky in appearance. Whether it is likely to be used largely for manufactures is quite another matter, upon which no off-hand opinion would be worth much.

THE LARGEST SKY-LIGHT.—The sky-light in the new building of the Board of Trade in Chicago, will be the largest in the United States, and will be constructed by a manufacturer of that city. Its dimensions will be 60 by 68 feet, divided into 225 parts 46 inches square. It contains very little color, the problem presented to the artist being the greatest possible amount of light combined with the highest ornamentation. The figures are rich in coloring, but slender and serpertine, the ground being nearly white. The glass is partly Venetian, partly cathedral, and partly opalescent, one-eight and one-sixteenth of an inch in thickness. The sky-light will be finished by October 15th, and will cost about $5,000.

GLASS COATING ON METALS.—The following method has been suggested for coating metallic surfaces with glass, which may be found to answer various purposes. Take about 125 parts (by weight) of ordinary flint-glass fragments, 20 parts of carbonate of soda and 12 parts of boracic acid, and melt. Pour the fused mass out on some cold surface, as of stone or metal, and pulverize when cooled off. Make a mixture of this powder with silicate of soda of 50 B. With this coat the metal to be glazed and heated in a muffle or other furnace until it is fused. This coating is said to adhere very firmly to steel or iron.

LABELS can be glued on tin boxes, etc., exposed to moisture by the following process, and they will not come off, even if dipped or allowed to remain in water: The white of an egg should be mixed with half as much water, or the dessicated albumen of commerce dissolved in two or three times its weight in water. Apply with a brush to the surfaces to be united; then iron with a very hot flat-iron. Several layers of paper and a glue thus treated will render any box or anything of the kind impermeable to the water.

TO SOFTEN A PAINT BRUSH.—When a paint brush is stiff and hard through drying with paint on it, put some turpentine in a shallow dish and set it on fire. Let it burn for a minute until hot, then smother the flame and work the pencil in the fingers, dipping it frequently into hot spirits. Rinse all paint brushes, pencils, etc., in turpentine, grease with a mixture of sweet oil and tallow to prevent them from drying hard, and put away in a box out of the dust.

THE MOSQUITO'S INSTRUMENT OF TORTURE.—A writer in the London *Sportsman* thus describes a mosquito as seen under a microscope: It appears that in the "bill" of the little beast alone there are no fewer than five distinct surgical instruments. These are described as a lance, two neat saws, a suctious pump, and a small Corliss engine. It appears that when a "skeeter" settles down to his work upon a nice tender portion of the human frame the lance is first pushed into the flesh, then the two saws, placed back to back, begin to work up and down to enlarge the hole, then the pump is inserted, and the victim's blood is siphoned up to the reservoirs carried behind, and finally, to complete the cruelty of the performance, the wretch drops a quantity of poison into the wound to keep it irritated. Then the diminutive fiend takes a fly around just to digest your gore, and makes tracks for a fresh victim, or if the first has been of unusual good quality he returns to the same happy hunting ground. The mosquito's marvelous energy, combined with his portable operating chest, make him at once a terror and a pest.

KEEPING WOOD IN MOIST GROUND. A Brooklyn (N. Y.) carpenter writes that in 1864 he laid down some old painted half-inch door panels as a flooring for a coal bin at the rear of his yard, and that, on taking them up seven years afterward, they were just as sound as if they had been but recently cut from a thrifty living tree, although so pliable with moisture that he could have bent one of them around a six-inch stove pipe. Our correspondent suggests that the painting of railroad ties, or coating them with white lead and oil, would be very efficacious for their preservation.

STAINING RATTAN CHAIRS.—Wash the rattan with a concentrated aqueous solution of iron acetate, having a strength of 14° Baume. Repeat this until a desirable shade is produced; then give a coat of quick-drying varnish, such as can be made by dissolving black wax in spirits of wine.

A NEW LUBRICANT.—A Dresden man has made a good lubricant for shafts by mixing the whites of eggs with the finest graphite powder to the consistency of firm dough. This is kept in boiling water till the whole is coagulated. The mass is then reduced to powder.

THE TALLEST HOUSE. The tallest flat house in New York has 10 full and 3 attic stories in front, 15 stories in the rear. It is 170 feet high. There are many of 12 stories, from 140 to 150 feet high.

SUBSTITUTE FOR HUMAN HAIR. A substitute for genuine human hair is now made out of the inner lining of the bud of the palmetto tree. It can be made of any length and dyed any color.

THE TRUCKING BUSINESS.—Thirty thousand two-horse trucks are employed in the business of New York City. Upward of $20,000,000 are invested in this industry.

LINKS AND PINS.—It costs annually $1,200,000 for links and pins for the freight cars in this country.

GOOD HEALTH.

A Chapter on Arnica.

A bottle of arnica in the house, especially when one lives remote from drug stores and physicians, will frequently prevent serious trouble. Indeed, I think a judicious use of arnica would, in many cases, prevent that dreaded culmination of so many wounds—lock-jaw.

Experience has been my teacher in the use of this remedy, and I will relate two incidents in my own family, and I could cite many more, both in my own and in families of my neighbors. My boy, while engaged in a game of ball, ran with full force against a fence of barbed wire. Reaching out his hands, he caught the points in his fingers, tearing the flesh nearly to the bone, making a jagged wound.

I at first bound up his hand in carbolic salve, but the next day found the wound had an unhealthy appearance. I was a little alarmed, and consulted my medical work, and found arnica was the remedy. I immediately applied it, with most satisfactory results, the wound soon assuming a healthy appearance and quickly healing.

Another time, that same boy was trying to domesticate a hawk which he had fired at and wounded, and in an unguarded moment the hawk thrust his talons nearly through his hand. It was impossible to pull them out until he placed his heel firmly on the bird's head, when his hold relaxed and we drew out the claws, leaving some ugly wounds.

I quickly bathed the hand in warm water, then bound it up in arnica. It healed rapidly and almost without pain. Being a homeopathist, I also give a few doses of arnica internally, which aids the cure.

I prepare my own tincture in the following manner: I buy two bits worth of arnica flowers of the druggist, put them in a glass jar, and pour over them one quart of alcohol, adding more alcohol as I use it, until the strength of the flowers is all extracted.

Before using I dilute the tincture to about one part arnica to four parts warm water. For cuts and wounds where the skin is broken, bathe around the injured parts, then bind up with a cloth dampened with the arnica, repeating as often as may be required by the pain.

For bruises bathe freely and bind up with a cloth wet with the arnica. It allays the pain, removes the soreness and causes wounds to heal rapidly.

If an eruption appears while using it, or there is a tendency to erysipelas, some other remedy must be resorted to. My medical work recommends the use of calendula (the common marigold), but as arnica has been the sovereign remedy in my family and community, I have had no occasion to try any other.

J. M. H.

Tar and Turpentine in Throat Disease.

Impregnation of the atmosphere of a sick-chamber when the patient is ill of diphtheria, measles, scarlet fever, or of any allied disease, with the odor of a mixture of equal parts of turpentine and carbolic acid is recommended by Dr. Vilandt. Half a teaspoonful of the mixture will be enough at a time, if it is put into a kettle of water kept near the boiling point. The odor generally gives some relief to the sufferer, and tends to prevent the spread of the malady.

Dr. Delthil reports to the French Academy of Medicine wonderful cures of membraneous croup and diphtheria by the use of the vapor of liquid tar and turpentine. Dr. Delthil's process was described. He pours equal parts of turpentine and liquid tar into a tin pan or cup and sets fire to the mixture. A dense resinous smoke arises, which obscures the air of the room. "The patient," Dr. Delthil says, "immediately seems to experience relief; the choking and rattle stop; the patient falls into a slumber and seems to inhale the smoke with pleasure. The fibrinous membrane soon becomes detached, and the patient coughs up microbicides. These, when caught in a glass, may be seen to dissolve in the smoke. In the course of three days afterwards the patient entirely recovers."

Dr. Nichols tried this treatment with little Ruth Lockwood, daughter of a printer in the New York *Times* office. She was lying gasping for breath when he visited her. First pouring two tablespoonfuls of liquified tar on an iron pan, he poured as much turpentine over it and set in on fire. The rich resinous smoke which rose to the ceiling was by no means unpleasant. As it filled the room the child's breathing became natural, and as the smoke grew dense, she fell asleep.

BOWEL COMPLAINTS.—For even severe cases of stomachic and bowel troubles incident to warm weather, a medical writer recommends the following simple preparation, after having used it with very satisfactory results in his own family and elsewhere for many years, viz.: Take equal parts of laudanum, syrup, rhubarb, spirits camphor, essence peppermint, and one-half part of cayenne pepper. Dose, from one drop to teaspoonful, according to age, and given from ten minutes to ten hours apart, as severity of the attack may require. Leaving out the red pepper, it may be given to infants only a day old, in one-drop doses, morning and evening. Of course *common sense* should accompany the mixture. The small amount of laudanum need not be feared, and neither the above nor any other medicine should be given children unless absolutely necessary. For colicky infants the above is far preferable to any of the "soothing syrup" poisons so freely used.

A BUG IN THE EAR—HAPPY THOUGHT.—A few weeks since, one of those snapper-bugs flew in at the open window and lit on the ear of a gentleman who was asleep, in the city of Macon, Ga. The bug entered the ear and commenced his snapping and tearing at the delicate lining of the ear with its claws. The snapping sounded like the beating of a thousand sledge-hammers, and the clawing caused almost insupportable pain. The bug was too far in to be pulled out by the fingers, and the gentleman arose and his wife tried in vain to get it out with a needle and a hair-pin. At last he resolved to go to a doctor, and while dressing himself his wife happened to think of the attraction light had for bugs and moths. She placed the lamp near the ear, and in less than half a minute the bug crawled out backward with the blood oozing from the ear.

STRENGTH OF THE ANCIENTS.—Physical superiority of the ante-Alexandrian Greeks to the hardiest and most robust nations of modern times is perhaps best illustrated by the military statistics of Xenophon. According to the author of the "Anabasis," the complete accoutrements of the Spartan soldiers, in what we would call heavy marching order, weighed 75 pounds, exclusive of the camp, mining and bridge-building tools, and the rations of bread and dried fruit which were issued in weekly installments, and increased the burden of the infantry soldier to 90, 95, or even to fully 100 pounds. This load was often carried at the rate of 4 miles an hour for 12 hours per diem, day after day, and only in the burning deserts of southern Syria the commander of the Grecian auxiliaries thought it prudent to shorten the usual length of a day's march.

A FLY'S BITE.—W. J. Barry, a wharfinger at section 4 of the seawall, in this city, a few days since, felt a stinging sensation of the right hand, and noticed a yellowish colored fly trying to make a meal at the seat of pain. The fly was brushed off and nothing more was thought of the matter for an hour or so. At the expiration of that time, Barry noticed his hand had swollen considerably, and the member during the afternoon had increased to twice its natural size, necessitating the services of a physician. The victim thinks the fly had taken a sip of water from the stagnant and loud-smelling pool back of the seawall, and that some of the poisonous liquid had been injected into the blood.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BUTTE CREEK.—Amador *Ledger*, Aug. 28: The contract for sinking the Mahoney shaft 100 ft deeper has been completed. The contractors have done very well by the job, realizing about $3½ per day, after paying all expenses. This brings the shaft to a total depth of 1000 ft. A force of men are now at work lowering the pump and doing some necessary repairs to the shaft. When this is completed, which will be in a few days, drifting at the 1000 ft level will be pushed ahead. A few additional hands have been put to work in the Amador Consolidated, preparatory to the commencement of sinking operations. William Johns, who is Superintendent of several mines in Plumas county owned by English capitalists, has been here for several days for the purpose of testing the new pumping apparatus, operated by water power, the invention of Mr. Knight. The pump has been made expressly to order for the Eureka mills, Plumas county. The test proved entirely satisfactory. The machinery will be shipped in a few days. It will weight several tons.

El Dorado.

THE HOUX AND SAILOR JACK MINES.—*Mountain Democrat*, Aug. 28: The Grays and Bosquit are vigorously working the Houx mine, located at Gray's Flat, in White Oak township, with very flattering prospects. The ledge is wide and strong and the ore the best ever taken out of a regular ledge in that vicinity. At the Sailor Jack mine the same parties are opening a new road, so as to let them into the mines with timbers and other materials needed, when a force of miners will be put to work.

Inyo.

ARGUS RANGE.—Inyo *Independent*, Aug. 30: Last Wednesday Mr. White, of Darwin, brought in to Keeler a bar of silver bullion, valued at $1,800, the product of 10½ tons of ore from the Argus Range mines. The ore was milled at the Riley mill, and although the expense for hauling it is great, a handsome profit is still left to the miner. With the natural facilities existing close to the mine, a mill could easily be built and run that would make the State Range very valuable property. There is a large amount of ore similar in quality to that from which this bullion was obtained, and these united advantages cannot fail to induce some parties to take hold of the property who are able to make the necessary improvements.

HAWLEY MILL.—The Hawley mill was started on Tuesday of last week, and has been running steadily since. A correspondent says: "I can assure you, though heavy, yet it is welcome music made by the dropping stamps in the Hawley-Keeler mill once more, and on ore that will beyond doubt prove profitable to the owners, and renew the fame of Cerro Gordo and the Inyos."

PINE MOUNTAIN.—At Pine Mountain, Mr. Roberts has 8 men at work in one of his claims, and will soon begin shipping ore to San Francisco. He has a lot of ore now ready, and will have it packed out to the railroad without delay.

MAMMOTH.—Is not entirely dead. Several men worked there during last winter, and are still working, taking out ore, and at present running an arastra. Mr. Townsend passed through here the other day with some bullion for shipment. He predicts a "hoom" for old Mammoth yet.

LAUREL HILL.—Mr. Maxwell, of Laurel Hill district, was in Round Valley to-day. This gentleman, with others, has been operating in Laurel (this district is southeast of Mammoth, and overlooking Long valley) for six years. He says that they have ore there assaying from $25 to $100 per ton, and some of it must and will be "squirched" before long.

ROUND VALLEY MINING MEN.—Messrs. Brooks and Sherwin, of this valley, are jubilant just now over a new discovery called the "New Boom." The organization of a new mining district is being agitated, which will take in the old French district, Rock Creek mine, and all the detached hills south of Round Valley.

Mono.

STANDARD CON.—Bodie *Free Press*, Sept 1: Extracted and shipped to the mill 552 tons of ore and 590 tons of tailings. Received from the ore 630 ounces of crude bullion and from the tailings 435 ounces. Shipped to the company this day $16,004.92 of which $11,209.28 is from two weeks' run on ore and $4,795.34 from two weeks' run on tailings.

BODIE CON.—At the mill 190 tons of tailings were worked, the average assay value being $7 per ton. All in and about the mine is working well. Thirty-seven men are employed.

CON. PACIFIC.—Since last report the drift on Pacific ledge No. 1 has reached a distance of 42 ft from the chute. Rock still hard. Ledge keeping an average width of 16 inches and yielding some good milling ore.

Mariposa.

HORNITOS.—Cor. Mariposa *Herald*, Aug. 29: Mr. Hulings, our moneyed man, is expectly hourly, and when he arrives it is thought our mining interests will loom up. Some ill-feeling has been engendered between miners and land-owners in this vicinity, by prospectors prospecting on pre-empted land. The owners of the Duncan mine have moved their machinery and built a commodious house on the north side of their claim with the expectation of striking some very rich pockets, as it is well known that the Duncan mine is the richest mine in this section of the county. The owners of said mine deserve much credit for their perseverance and energy in developing the same.

Placer.

QUARTZ INTERESTS.—Placer *Herald*, Aug. 30: There is rather more prospecting going on just now on the quartz ledges of this section than for some time, and the developments are most invariably of an encouraging character. Holden & Smith have for some time been working a lead out near the Chinese graveyard, and, from all accounts, their rock is fabulously rich. We have seen quite a number of specimens from their mine, and all of them show free gold in profusion. It is indeed a specimen ledge, and yet the rick streak, as they have demonstrated by different shafts, is quite extensive. Messrs. Norton and Hooper are working the old Crœsus ledge, on Baltimore ravine, on a lease, and their prospect is said to be very encouraging. Mr. Totten, whose mine is also near Baltimore ravine, has associated with himself some Eastern parties, and is preparing to erect such works as will be necessary for the thorough development of the lead. This ledge has turned out some rich quartz, and good results are confidently expected when the works are completed. Chas. Reed and Thos. Oats have been reopening and working the old St. Lawrence recently, and they are meeting with good results. They have a ledge of all milling ore that averages 2 ft and 3 inches in thickness; and a crushing of 15 tons at the Pelster mill, run through the latter part of last week, averaged $20 per ton. Jacob Kaiser, who has been working a ledge near North ravine, lately had a crushing at Pelster's mill, from which he realized $600. One or two ledges on Duncan hill are also being opened systematically. Altogether, quartz mining in the district seems to be somewhat reviving, and the almost universal success of those now operating is likely to have the effect of giving even greater stimulus to the business.

A PROMISING NEW QUARTZ MINE.—The Big Oak Tree quartz ledge, parallel to and not far from the late famous Rising Sun mine, in Colfax district, bears indications of proving as rich as the Rising Sun has been. It is owned by Wm. Werry, Joseph Werry and Phil. Nicholls. The last two, Joseph Werry and Nicholls, have recently bonded their interest to Mr. Greyson, of Oakland, and it is the intention of Greyson and Wm. Werry to proceed at once to a thorough development of the mine. The ledge is of good size, and, so far as prospected, the rock pans out surprisingly well.

Sierra.

A HOG CANYON QUARTZ MINE.—Sierra *Tribune*, Aug. 30: W. R Chamberlin, of Reno, paid a visit to Hog canyon last week. He is interested in a quartz ledge there with L. J. Flint and J. D. Fagg. The mine is being developed under the supervision of Mr. Fagg. Some very fine prospects have been obtained and the owners feel in the best kind of spirits over the outlook of their property. They have secured the use of the Lamping mill and in a short time will begin crushing ore. A track has been laid to connect the mine and mill. Parties who are informed tell us there is a fine country prospect in for quartz up that way.

SOL. WOOD'S PROSPECT.—From all accounts Sol. Wood has found a big thing in the quartz line in the vicinity of Butcher ranch. He is sinking a shaft on the ledge at present, and although he don't make much fuss about it, has obtained some splendid prospects. Mr. Wood used to be interested in the Four Hills mine with our friend Stephen Spencer. Both of these gentleman sold their interests in that claim and the present owners who purchased of them struck the rich body of ore only four ft from where the former parties had quit work.

NEW LEDGE.—*Mountain Messenger*, Aug. 30: R. D. Williams, of Jim Crow canyon, has discovered a new ledge near the one he has been working heretofore. It is higher up the hill, and bids fair to be richer than anything ever discovered in that vicinity. John Barton is digging a new ditch for his claim on Crayeroft Hill. J. B. York has got his lower tunnel in to the ledge, which is from 4 to 5 ft in width at this point, and prospects well. He is now prepared to get rock cheaply and expeditionsly. The North America gravel mine, Hepsidam, is yielding very good returns this year. Taylor & Forbes are getting out the iron-work for the new 40-stamp mill for No. 9 tunnel at Sierra City. A very fine prospect in coarse gold has been obtained on the headwaters of Canyon creek by a man named Scott. He has good indications of a channel. The Extension Co. are now raising a chute for gravel, at the end of their main tunnel, 5,900 ft from its mouth. The rock is good and the prospects of raising in the channel are favorable. Geo. Hardy has located a deposit of iron ore on the wagon-road, about six miles above town. The specimens appear to be rich and the deposit extensive, and it is so situated as to be very easily got at.

Shasta.

SOUTH PARK.—Cor. Shasta *Courier*, Aug. 30: Bids are being received for running the lower tunnel at the Crystal. This will tap the ledge 100 ft from the surface. The water interfered with work in the shaft where work will be discontinued until the tunnel is fully completed. Two tons from the ledge have been shipped below for testing. This will give a fair sample of the ore at the bottom of the shaft—70 ft below the croppings. A shaft is to be sunk 40 ft on the Dayton. Preliminary work is now being done with that object in view. Robinson & Co. are getting some good ore from their "Cooper Ledge," and getting the mine in shape to work more economically than at present. The ore is crushed in their cannon ball mill. Their new concentrator gives satisfactory results. E. L. Ballou's arastra is running on Manzanita ore. The mine is looking well and an abundance of good ore in sight. D. H. Hubbard and partner are running their arastra on Pacific ore. Wright & Ormsly are also running their arastra.

Tuolumne.

AT WORK.—Tuolumne *Independent* Aug. 30: Dave Levy, Superintendent of the Old Tuolumne quartz mine, above Columbia, reports work going on lively. Hoisting works erected, with house machinery in place, and pumps, which will be run by a Knight wheel, under 300 feet pressure. A great deal of grading and excavating has been done, the main working shaft has been re-timbered to the depth of 160 ft, and all preliminary work is being pushed to rapid completion. Six men are now at work and in a short time it is expected the force will be largely increased.

NEVADA.

Washoe District.

OPHIR.—Virginia *Enterprise*, Aug. 30: On the 250 level some ore is still being extracted from the fillings of the old drifts.

MEXICAN.—The joint Ophir, Sierra Nevada and Union Consolidated winze below the 3200 level has been sunk and timbered about 10 ft. The usual vein porphyry is taking the place of the bastard quartz which has heretofore been the predominant material at the bottom of the winze. The winze has but about 8 ft to go to reach the 3300 level. It will then be sunk about 10 ft further for a sump, when a station will be opened and a drift started west toward the mineral-bearing quartz found farther to the west on the levels above.

HALE AND NORCROSS.—The large double-track drift running north from the 2800 station is making about 45 ft per week. It is skirting the east side of the ore vein and on the west side occasionally cuts into the edge of what appears to be a strong body of quartz. The drift is being substantially timbered as it progresses and a drain is put in and covered as the work advances. The drift will be pushed forward to the Savage south line as soon as possible. Last week they shipped to the Eureka mill 383 tons of ore and received from it $7,744 47 (par value) in bullion.

BEST AND BELCHER.—The west drift on the 2500 level is out about 585 ft and is at present in a hard rib of vein porphyry. The drift has yet about 70 ft to go to get under the point where quartz and a good prospect were found above. The north drift from the 825 station of the Bonner shaft is out about 350 ft and is in vein porphyry with some seams of clay and stringers of quartz. The drift will open for cross-cutting a large area of ground hitherto unexplored.

ALTA AND BENTON.—The west drift on the 2150 level continues in quartz of a good quality, which carries some metal. The branch drift into the Benton ground is also in quartz of about the same kind. A second diamond drill-hole was last week started from the face of the east drift. This is a 2-inch hole, and will materially hasten the draining out of the ground lying to the east, and in which a large body of quartz, giving good assays, is known to exist.

CHOLLAR.—West cross-cut No. 1 was advanced 208 ft, most of the way through quartz, when the west wall was reached and its bearings taken. The ground was dry the whole distance. No. 2 cross-cut has now been started west from the main south lateral drift at a point 100 ft south of No. 1.

SIERRA NEVADA.—Are still repairing the drift on the 2300 level through which passes the compressed air pipe.

UTAH.—The material encountered in the southeast drift on the 1950 level has become quite hard. There is no water to interfere, the drift is cool and the workmen are able to make rapid progress. Some clay streaks are running in the direction of the drift, while seams of clay cut across it at short intervals.

ANDES.—A cross-cut is being run from the bottom of the winze. It is in soft white quartz that promises to carry ore. The north drift is in quartz that gives low assays. About the usual quantity of low-grade ore is being obtained.

ALPHA.—The north drift on the 500 level is making about 25 ft per week. The face of the drift is in quartz giving low assays.

BELCHER.—The usual quantity and quality of ore is being taken out on the old upper levels and sent to the mills on the Carson river. A considerable amount of prospecting work is being done.

CROWN POINT.—All work is going on about as usual. Sufficient low-grade ore is being extracted to keep the river mills in full and constant operation.

SCORPION.—The usual progress is being made in the north drift on the 500 level, and the material remains about the same as heretofore.

YELLOW JACKET.—The usual quantity and quality of ore is being extracted and a considerable amount of prospecting work is being done.

CON. VIRGINIA AND CALIFORNIA.—Are clearing up on the 2900 level preparatory to a resumption of operations at that point.

Belmont District.

A GOOD JOB.—Belmont *Courier*, Aug. 30: Some days since one of the cam shafts of the Monitor Belmont mill was accidentally broken in two. This shaft weighs about 3,000 pounds, and it was thought that the company would be obliged to send to San Francisco for a new one. James Coleman, the blacksmith at the mill, thought differently, however, and proposed to repair the broken cam shaft at the shop and make it as good as new. Many thought that this was impossible, for the reason that Mr. Coleman did not have the proper tools to accomplish the feat. At any rate, it was agreed that he should try his hand, and with the aid of the common blacksmith's forge, single bellows and tools he uses in the company's shop he succeeded in joining the two pieces, and the cam shaft is now, as Mr. Coleman said it would be, as good as new. This shows what a dexterous workman and first-class blacksmith can accomplish in an emergency of this kind. Stephen C. Rhonnan, who has returned from a prospecting tour through the southern country, showed us on Wednesday several rich specimens of gold quartz which were taken from claims situated about 8 miles west of Gold Mountain. He also brought in two nuggets, one of which is worth at least $30. They were found about 10 miles west of Gold Mountain. He says that it is almost impossible to work the gold claims in that section, on account of the rush of the waters.

Cherry Creek District.

RICH ORE.—White Pine *News*, Aug. 28: Al. Barrick, F. W. Griswold and George Taylor took out ore valued at $300 in one day last week in the upper workings of the Ticup mine; and yet Cherry Creek mines find no favor with men of capital. The time will come, sooner or later, when the two mineral belts that form a semi-circle above our town will be worked by aggregated capital, giving employment to thousands of men and pour a stream of the precious metal into the markets of the world. But before this occurs our leading mines must pass into the hands of men whose ambition will rise above the swindling tactics of those who now hold control. When our mines are worked to the sole end of making money for their owners, instead of defrauding the community, Cherry Creek will show that her mines bave true merit, and the capitalist who will be so fortunate as to invest in them will reap a rich reward.

Esmeralda District.

TWO AURORA MINES.—Eureka *Sentinel*, Aug. 29: The Humboldt mine is now working 20 men. Ore is being taken out as the development progresses On the Silver Lining 14 men are at work, running drifts north and south from the shaft. They take out about 10 tons a day. These mines now supply enough ore to keep the mill running nearly all the time, and there is not a question that when capital can be secured to open them extensively they will rank among the richest mines in the State.

Galena District.

INTEREST REVIVING.—Battle Mountain *Messenger*, Aug. 28: In 1867, before the snorting of the iron horse astonished the Indians and alarmed the coyotes in the valley of the Humboldt, Robert McBeth, the first Sheriff of this county, and George W. Fox left Unionville with an Indian guide, known to the whites as Shake-Hands-John, on a prospecting tour. They discovered Battle Mountain mining district, and located the Little Giant mine, which, for a while, was one of the richest in Central Nevada. Subsequently they found rich galena mines in the new district, in the vicinity of which McBeth located the town of Galena. The mines were very productive for a while, but when the ore bodies found near the surface were worked out, the district was partially abandoned, though many new and promising prospects were discovered. By act of the Legislature of 1873, the district, which up to that time belonged to Humboldt, was ceded to Lander county, of which it now comprises a part. Several of the original settlers still reside in Galena, and with J. A. Blossom and other Battle Mountain men have clung to their mining interests, believing that sooner or later they will reap the reward of perseverance and patience. The mine owners are now working with renewed energy and with very encouraging prospects. B. F. Wilson is preparing to start the White & Shiloh mill on ore from the Trinity mine. J. A. Blossom has put a force of men on the Temby mine extracting ore. Andy Melander bas men at work on the South Buena Vista extracting ore, which he ships to Salt Lake for reduction, and H. Driscoll has a large body of high-grade ore in the Honora mine, a chunk of which, weighing 120 pounds and assaying high in silver, is on exhibition at Lemaire's store in Battle Mountain. All that is required to make the camp prosperous is suitable reduction works, as there seems to be plenty of smelting and milling ores in sight.

Jefferson District.

LEACHING.—Belmont *Courier*, Aug. 25: Hon. George Ernst and Charles Kanrohat have been for the past few days, employed in leaching ore extracted from Mr. Kanrohat's mine at Jefferson, and we learn that these gentleman are meeting with success.

Mount Cory District.

DULL.—Walker Lake *Bulletin*, Aug. 30: Business is at a standstill, and there are more men here now than can make a living. Prospecting is vigorously pushed in the surrounding mountains, with a flattering outlook. Everything around the mine is running as smoothly and satisfactorily as usual, with a full force of men. Lew Stoner still continues to work his claim with all vigor and hopes of the future. The prospects are encouraging and promise soon to uncover a body of rich ore. Success, Lew.

Ophir Canyon District.

GOOD PROSPECTS.—Belmont *Courier*, Aug. 25: From Angus McArthur, who recently returned from the Toiyabe mountains, we learn that the mining propects at Ophir canyon and other districts are good. Mr. McArthur, like many other practical mining men, believes that rich mines exist in that portion of Nye county, and that all that is lacking there is capital to work the properties in a systematic manner.

Patterson District.

PROMISING.—White Pine *News*, Aug. 28: P. Peterson has returned from Patterson district. He speaks well of the place, and thinks when works are put up there, the district will prove rich and profitable.

Sacramento District.

THE HUMBOLDT QUEEN. —*Silver State*, Aug. 28: An important strike has been made in the Humboldt Queen mine, near Rye Patch. Reports from reliable sources are to the effect that a large body of very rich ore has been found in the mine at a depth of 125 ft from the surface. The strike is said to be the most important ever made in Sacramento district. The extent of the ore body is not yet known.

Tuscarora District.

BELLE ISLE.—*Times Review*, Aug. 30: North drift from joint line cross-cut, 150 ft level, has been extended 11 ft; total length 19 ft. The vein continues to carry high-grade ore, in width between one and two feet. Fair progress has been made in the line upraise from the 250-ft level. No material change to note.

NAVAJO.—The main drift has attained a total length of 270 ft south from the Belle Isle line. On the 150-ft level, the south drift from the line cross-cut has been advanced 7 ft. The vein continues between 4 and 5 ft wide. North drift from No. 2 cross-cut shows a better width of ore and has been extended 8 ft, total length 125 ft. No. 3 winze in south drift from No. 2 cross-cut has been sunk to date, 16 ft. The ore streak keeps its width and the last few feet shows considerable free gold. Fair progress has been made at all other points, showing no change worthy of note. The usual grade and quantity of ore has been sent to the mill.

White Pine District.

STAFFORD.—Cor. White Pine *News*, Aug. 28: Since the return of Mr. E. N. Robinson from the East, things have begun to enliven to quite an extent. He immediately placed a force of men upon the Stafford mine, which is now increased to the number of eighteen. He also has two men at work in the Wheeler tunnel, at which place bad air is a serious detriment. The company's mill is undergoing repair, a number of men being employed upon it. At the Stafford mine, after passing through what had hitherto been considered a hanging wall, a body of ore was discovered, which assays well, and up to date shows every appearance of being quite a quantity. The mine is certainly looking very promising now. Messrs. Shearer & Jacobson encountered such bad air in their mine at a depth of only 19 ft as to keep a candle from burning. They have now remedied this by communication with their old works,

QUARTZ MINES. Nevada *Transcript*, Sept. 1: The Merrifield mine is looking first-class. It is now upon a solid footing. The management has increased the working force to about 50 men, and the 20-stamp mill is kept in operation during the daytime. As soon as an opening is completed (which will be in about two weeks) to give better ventilation, more men will be employed, and the mill will run night and day. The mine is under the sole management of D. T. Hughes, one of the best miners on the coast. The mine of Balbridge and Kagan, on the Covoteville bedrock, continues to look well. Their first crushing paid them $80 per ton, and the rock they are now taking out looks equally as well as the first lot. They are down about 40 feet, and are using a hurdy wheel with a double-action Douglass pump, which keeps the mine free from water. The ledge is about four inches thick, and increasing as they go down. The Wilson Mining Company have taken out a crushing of rock, and the result was far beyond their expectations. The test was made on rock from near the surface. If the thousands of tons of rock in this mine would pay half as much as the test rock did, the property will be equal in value to any in this section. The Murchie mill is now being run on rock taken out of the Hussey mine at Willow valley. The rock looks fine. A good crushing of ore has been taken out of one of the Murchie's many ledges, and will be milled in a few days. It has a bright and lively appearance, and will undoubtedly make a good showing. Work was resumed yesterday on the Niagara claim on Fly creek. A 12-foot overshot wheel is being put in, when the shaft will be sunk as deep as possible before the running of any levels is commenced. There is considerable activity in the Willow valley district, and all the claims thus far prospected present a good appearance. Robinson & Co., who are opening the Blum & Curry ledge, a few days ago struck, at a depth of 43 feet, what appears to be a very rich deposit of ore, although, owing to a scarcity of water with which to keep their pump going at night, they are not making very good headway in prospecting the find. Some years ago a pocket that yielded $10,000 was found in the same locality.

ARIZONA.

NACOSARI. Tombstone *Epitaph*, Aug. 28: The latest news from Nacosari is that the new Swansea roaster of the New Jersey company is completed and in working order, and wagons are running over the new road to the mine. Work will be commenced on the San Pedro at once, which is four miles up the canyon from Nacosari camp. Times are lively and everybody feels encouraged.

RICH STRIKE IN THE TWEED MINES.—Florence *Enterprise*, Aug. 28: We learn from Mr. G. N. Finch, who came down from Dudleyville this week, that a very rich strike has been made in the Tweed, or San Carlos group. The strike was made at a point where one was least expected. The company was having a tunnel driven into a hill above a spring with a view to striking the head of the latter and increasing the volume of water. When in a considerable distance the tunnel entered a body of native copper. When Mr. Finch, was at the mine, Saturday, the tunnel penetrated this ore body a distance of six ft and was still all in ore. Mr. Finch went into the tunnel and saw the ore for himself so he knows it is there. The sides, floor, top and breast of the tunnel are a solid mass of ore, consequently it is not known how large the body is. We have a specimen of the rock, and it will go at least 70 per cent in copper, and we think it will assay well in silver. This strike insures the success of the San Carlos group.

LIVELY.—*Epitaph*, Aug. 29: Silver King is livelier now than it has been for years. There is not an idle man in the camp, and business is booming. One hundred and fifty men are employed in the Silver King mine alone. A report to the effect that the King company have leased the Hastings mill is current here, and if true the life and business in that section of the country will be greatly increased.

COLORADO.

THE MINES AT LAWSON. Colorado *Miner*, Aug. 28: Messrs. O'Brien & Co. shipped 9 tons of ore from their lease on the White lode, the first class of which ran 240 ounces, and second class 110 ounces. The boys are still hammering away, and have a fine streak, from 5 to 14 inches wide, which is pay ore. They have worked this lease for 20 odd months, and have made more than $3 per day to the man. Messrs. Longacre & Gates, on the Free America Extension lode, have a very fine streak of ore. It is a new strike, they having encountered it while drifting on the lode. They have drifted 40 ft on the streak, and it averages 8 inches in width. Bridenstein & Co. are running a cross-cut from the second level of the Free America Extension. They are now in 41 ft and will soon be in pay, as ore bodies are known to exist ahead of them. Potter Bros. & Co. are taking some fine ore from the ninth level of the Boulder Nest lode. They will run 10 tons this week. Their last mill-run gave returns of first class, 263 ounces and second class, 81 ounces. Irvin, Renwick & Co. are sinking from the Moore level on the Syster streak, and are doing well. The ore in this streak ran 200 ounces silver. The boys think they have a bonanza, and are running three 8-hour shifts. Messrs. Caruthers & Keaggy are still sinking on their new discovery, which runs alongside the Young America lode. They are now down 20 ft, and have had one mill-run that went first class 802 ounces silver per ton. A. Stevens has the Young America lode leased and bonded, and is shipping ore regularly.

THE BALTIMORE PROPERTY.—Messrs. Vivian & Co., leasing on the fourth level of the Baltimore lode, are drifting west, and have a fine streak of high-grade ore, Pope & Co., on the fifth level, west, have a good body of ore. The Italians on the third level have fine ore and are taking out good pay. They are drifting and raising. In the fourth level, east, the lessees have good ore, and are raising and drifting. In the sixth level, west, Messrs. Custer & Co. have the finest body of ore in the mine. Their streak averages from three to eight inches in width, and the value of the four classes averages in mill runs about 300 ounces silver per ton. The main shaft of the Baltimore lode is being sunk, and is now down about 315 feet from tunnel level. There is some mineral in the bottom of the shaft. The output of the Baltimore property for this month will be about $10,000, and development work is being actively pushed in all parts of the mine, to increase the yield.

IDAHO.

CLEAN UP. Idaho *World*: A clean-up was made about a week ago at the Golconda mill. Seventy tons were put through. Mr. Monroe, who came down yesterday, says the gold contains some iron, worn from the shoes and dies, and will be sent to a refinery at Omaha. As an assay has not been made, it is not known exactly how much the ore milled, but it is estimated at $40 per ton. The 5-stamp mill crushes 10 tons of ore in 24 hours.

CENTERVILLE. Idaho *World*, Aug. 25: Joe Jackson was over this week from Centerville. He says James McCurdy and Hugo Bayhouse have sunk a shaft to the depth of 20 feet on the footwall of the Poorman ledge, a short distance this side of Henry creek, and owned by Bayhouse. They will soon run a drift to the ledge. The ore at the surface gave very encouraging prospects. Charley Miller recently discovered a ledge, 4 or 6 inches thick, about a quarter of a mile this side of the south fork of Henry creek. The ledge crosses the Basin stage road. Some of the rock prospects very well. Miller thinks he has struck the ledge that fed the placers on Henry creek. Lamberton, Morrell & Small are still sinking on their prospect in Lewis' gulch. They have struck several small, rich seams. The ledge seems to be divided. By sinking they expect to soon get down to where the seams come together and form a solid ledge.

SNAKE RIVER PLACERS. Shoshone *Journal*, Aug. 25: The Long placer claim, about one mile west of Starrh's ferry, on the Snake river, is now being worked successfully, and is averaging about $10 a day, with a simple horse-power for pumping the water out of the river. He has only a very small burlap machine, half size, yet with a meager supply of water--perhaps less than half its capacity--the machine saves $10 a day in gold dust. The crude experiment is another proof of the value and richness of our Idaho placers.

THE DAVITT.--Challis *Messenger*, Aug. 26: The owners of the Davitt mine are Richard Fitzgerald, Peter Hughes, Joe Soucy and Jack Kirk. The strike of the Davitt is east, and the dip is very small, being nearly vertical. The pay vein, so far as opened, is not very large, running from a few inches up to a little over a foot; but the marks, or ore signs, are very strong. Vein matter is much larger, and it is liable to turn to a very strong and rich mine. The ore is superior to any other camp in the mountains we have seen, where galena accompanies it in the least. Galena, silver, iron and copper indications are very strong in this rock, and some looks like gold rock prevails, although little is found yet. The Ibex is but a part of the whole vein occupied by the Davitt Ibex, and, we believe, another location. The general course is very direct, and great similarity prevails as to appearances, with this slight exception: that the Ibex is lower in altitude, and even more stupendous in color and form of base ore and vein surroundings. There are two tunnels, and a shaft leading from the top nearly to the lower one; tunnels about 40 feet apart, both run in on the vein perhaps a hundred feet in all. All work is on the vein, but has been done for exploration only. Still, there is a good pile of ore on the dumps. No considerable shipments have been made. The owners, Richard Fitzgerald and Peter Hughes, intend shipping when the packers get around.

AT CLAYTON there is a constant delivery of immense loads of ore both from teams and packs, and a smelter running about as smoothly as oil runs from a can. Twenty or thirty men were wanted, badly. Every man at work in a mining camp is a reliable omen of good. The smelter has been so overhauled as to permit the delivery of coal at a higher point, for the convenience of the whole works, than it used to be. Fine bins of ore were awaiting reduction. There were 25 bars of bullion being put out on each shift, on an average, or 50 during each 24 hours, at this time. Weight of bars 100 pounds each, the bullion running about $600 per ton. Considerable trade is centering at this point again, but the strong marks of waste and haste attendant upon a former mining excitement are broadcast. This will all be changed now. Men who understand their business are presiding.

THE EXCELSIOR was the only point that seemed to be carrying much interest or excitement as we passed on our way home. Here shots were crashing among the rocks and ore of the mine, and teams and pack trains were in such abundance at the ore house, at the foot of the delivery incline, that one could hardly get through. The Excelsior was working 26 men, but, like most other points, was increasing. The mine is opened 170 ft in length and 80 ft in depth in connection with the main, lower or present workings. The ore body runs from 2 to 16 ft in width, making an average of about 7 ft. Average returns from all ore shipped to the Clayton smelter up to date, this season, 103 ounces of silver and 34 per cent lead. The present working tunnel is 145 ft below the upper tunnel and 350 feet down from the topmost workings on the mine. All the ore is being reduced at the Clayton smelter which is taken out, leaving only about 100 tons reserve in the ore house against a possible misfortune, by any chance, in the mine. The daily output was 12 to 13 tons per day (since considerably increased), but for lack of teams would be putting out more.

PLACER.—*World*, Aug. 26: K. P. Plowman made a clean-up last Saturday in his placer claim at the back end of East hill. The amalgam weighed about 175 or 180 pounds, and runs about $110 or $111 per pound. Mr. Plowman will finish retorting in a day or two, when the exact figures of the clean-up will be known. The lowest estimate is $19,250. Work was commenced on the 22d of May. The claim has turned out well.

PRITCHARD CREEK.--*Inter-Mountain*, Aug. 30: From parties lately returned from Murrayville we learn that affairs in the Coeur d'Alene country seem to have settled down to actual business, and the excitement and rush and turmoil incident to the stampede have entirely subsided. The suspension of operations on the big ditch caused the throwing out of employment of between 250 and 300 men, which took some of the boom element out of the camp. The ditch was to have been 10 miles long, and when completed would have furnished 3,000 inches of water for the working of the old channel of Pritchard creek, lying about a mile and a quarter north of Murrayville, and 800 to 600 feet above the present channel. This old channel is claimed to show the richest prospects that have ever been discovered; but as the dirt has to be carried from a mile to a mile and a half before water can be reached with which to wash it, the investigation is attended with some difficulty. Below this old channel, wherever there is the trace of a little stream running down into the new channel, very rich pockets have been found, which is sufficient authority to the prospector for the assumption of the riches to be found above. In the present workings of the new channel the great difficulty experienced is the abundance of water and the roughness of the bedrock, the water washing the gold into the crevices as fast as it is uncovered or disturbed. The stories of large nuggets are still rife, and well authenticated reports come of a nugget weighing 52 ounces, while our informant exhibited the outline drawing of a nugget weighing about 30 ounces. The claims are undoubtedly rich in spots, but the impossibility of at present reaching any considerable area of bedrock precludes an intelligent estimate of the merits of the gulch. The claim owners are confident that they have within their grasp the much sought for fortune, and that while it is a hard country in which to mine, it is nevertheless rich enough to warrant the outlay of considerable time and money. For the man who is dependent upon wages for his daily bread and butter it is a good camp to stay away from, the ruling compensation of $3 per day not being allurement enough to stand off the hardships and privations to be encountered.

MONTANA.

THE MISSOULA GOLD FIELDS.—Helena *Independent*, Aug. 28: R. J. Cudner, of Missoula, who was in town yesterday, reports that the gold excitement continues unabated. It is not exactly an excitement, either, but more of a quiet business move in which a large portion of the business men of the town have interested themselves. Some 200 or 300 claims of 20 acres each have been taken up within 3 miles of town, and in some cases wheat fields even have been staked off. Some of the owners are very enthusiastic in regard to the future of the discovery. The pay on the surface seems to be good, and from this it is argued that when bed-rock (supposed to be some 20 ft deep) is reached, the amount of gold taken out will be great. One enthusiastic individual who owns only 5 acres has refused to take (even if anybody should be wild enough to offer it) $50,000 for his claim. He expects on reaching bed-rock to find a layer of nuggets 3 inches thick, he says. Some of the old residents of Missoula, however, refuse to place any faith in the discovery. They say that all the gold that is there is on the surface along the banks of Missoula river and at the mouth of Deer creek, and that it is merely a few scattering grains of gold that have been scooped by the ice while moving out of Gold creek and deposited here a grain or two at a time during hundreds or thousands of spring thaws. It is a fact that so far no gold has been found excepting on the river bank, but how tenable the theory above recited may be remains to be seen. In the mean time the claim owners intend to go right on with their work, as generally they are satisfied that they have fortunes almost in hand.

FIRST ORE SHIPMENT FROM THE ISABEL.—T. G. Merrill yesterday shipped to Newark, N. J., a carload of silver ore (smelting) from the Isabel mine, situated about 7 miles west of Helena, on the divide between Ten Mile and Greenhorn. The ore averages about $100 per ton, and comes (with scarcely any selecting) from a vein 3 ft thick. The Isabel is one of the mines owned and being developed by the Quartette Company, of which Mr. Merrill is manager. It promises to be a very valuable property.

LONGEST TRAMWAY IN THE WORLD.—The tramway to be constructed for the Helena Mining and Reduction Company will be one of Huson's patent endless-wire rope tramways. It will extend from the Comet mine to the bottom of the hill this side of the smelting works, a distance of 2½ miles. It will be the longest tramway in the world, and will cost $20,000. The construction will be under the personal supervision of Mr. Charles Huson, the inventor, and he expects to get it done inside of 60 days.

THE MOLLIE MCGREGOR.—Butte *Miner*, Aug. 29: About the 1st of last January, Messrs. J. R. Boyce and John H. Curtis bonded the Mollie McGregor lead, situated in the Boulder district, about thirty-five miles from Butte to a Connecticut company for the sum of $65,000. Since that time a hoisting works has been erected and machinery put in and everything done to put the property on a solid basis. Recently a body of ore assaying well was struck. This seems to have elated the parties having the mine under bond, and a short time since a letter was received from them making an offer of $30,000 cash down and $30,000 in six months for the mine. As the term of the bond has not yet expired, and the acceptance of their offer would involve a loss of $5,000, Messrs. Curtis & Co. have not yet given an answer to the proposition. The mine is said to be one of the best looking prospects in the Boulder district, and as it stands is worth $65,000 of anybody's money.

NEW MEXICO.

LEACHING.—Silver City *Enterprise*, Aug. 29: The new leaching process machinery which M. W. Bremen has been engaged in putting into his mill the past three weeks, is ready to make a test run, and will start up to-day. Mr. Bremen has between 7,000 and 8,000 tons of mill tails to treat by this process, and from which he will reap many thousands of dollars. A strike is reported to have been made in the Apache district, twelve miles southeast of Eureka, by McGee and Downy, two well-known prospectors, which is said to run from 68 to 226 ounces per ton. The vein is said to be from two to four feet in width. Work has been commenced, and a car shipment will be made immediately. Barney Tiernan has got down 365 feet on the King mine, at Eureka, but, as yet, has found no ore. He will continue exploration work to a depth of 500 feet, and if he encounters ore, such as was found on the surface of the claim, it will repay him for his work. Operations are being vigorously pushed on this property. Mr. Bonner, of Fleming, came into town on Wednesday, to procure ore sacks in which to put ore sufficient to make a carload shipment of the ore taken from his claim, two miles east of Fleming. He reports his property as looking well, and the ore improving in richness as depth is attained. On Monday next ore for another two car shipment from the Telegraph district will be brought into town by Mr. J. T. Mitchell, superintendent of the company's property. Regular shipments will hereafter be made from this camp of ore that will pay the company well, considering the expense and disadvantages which they have been obliged to contend against. Encouraging reports continue still to come in from Gold Gulch. More hard work is being done by the miners of this camp than is the case with any new camp in the territory. It is but a few months old, yet the work done since its discovery would lead one to think that the dumps are the result of years of work. Several car shipments will shortly be made by the mine owners, and the returns will be awaited with interest, as it is believed the average thus far assorted will run about $100 per ton. If this proves true, within a few months Gold gulch will be one of the liveliest mining camps in the territory.

OREGON.

NOTES. Jacksonville *Times*, Aug. 28: H. M. Hassett and A. T. Johnson have gone into Siskiyous on a prospecting trip. Dr. Inlow, of Ashland, struck some rich prospects the other day, getting about a dollar from half a bushel of dirt. He will prospect still further. Dan. Fisher, Robt. Dean and J. W. Ingram put a wing-dam in Rogue river this season, but we regret to learn that the enterprise has not proved a successful one. M. Volk, who is interested in the placer mines of Cow creek with Mr. Dunnell and others, was in Jacksonville Friday, accompanied by T. Ferguson. It is proposed to work these mines more extensively than ever next season.

UTAH.

PARK CITY NOTES.—*Record*, Aug. 28: It is reported that there has been a new strike on the Daly property. The Bon Homme Co. have just completed a whim for use on their shaft which is down in the neighborhood of 150 ft. Barry and Greggs' claim, the Talco, at the head of Deer valley is developed by a 50-ft tunnel and has quite a good showing, the ore taken therefrom carries 7 per cent copper and 7 ounces in silver per ton. There has been quite an excitement on Jubiter Hill made by three or four parties laying claim to the same piece of ground; the matter at present is at a standstill, one of the fighting men being in Salt Lake. A visit to the Sampson this week showed that that company was pushing work right along on that claim and the work being done there is of the most substantial sort. The new tunnel is in quite a distance and some very fine float ore has been found in it, when it is completed, it will cut the vein at a depth of 450 ft.

ALTA.—Salt Lake *Tribune*, Aug. 29: The mines of Alta lie around the heads of the creek on the sides of the hills in an amphitheater which might have been made by a glacier gouge. Henry Wagener is working the Moltke, which has a thin streak of very rich ore. James Wall & Co., are running a tunnel into the Peruvian and have good showing for a mine. Col. Sells is working the Skipper and the Sedan. He has a large body of low-grade iron ore. Captain Morrell is doing but little. The Morrell & Gardner Company wants to put up. Mines are not found or made to pay without the wherewithal. Lem Colbath's City Rock, striking straight through the divide at the head of the creek, has just sent down 5,000 sacks of ore. About 30 men are employed. In the Prince of Wales an important strike of good ore was lately made at a place, and at a depth entirely unexpected. It is high grade and two to three feet thick. The strike was made by the owners (Walker Bros.,) who lease most of the mine, but always have kept a few men at work on their own account. It is considered very important by those interested in the camp. Mr. Wallace is driving an adit tunnel under the old ore body in the Grizzly and Lavinia, which are owned by Capt. A. E. Goodrich of Chicago. Also raising from the tunnel about 400 feet in. The Evergreen, owned by Messrs. Pugsley, Folsom, Romney, and others, of Salt Lake, is taking out and shipping some ore. Mr. John W. Harker, of the Mackay and Revolution has leased the Equitable tunnel and is running a tunnel off from that under these mines. It will be some 400 ft below the old workings. There is said to be thousands of tons of ore in the old mine. Mr. Harker has purchased a mill site at the north of the canyon, and is negotiating for a wet process 10-stamp mill, with which he expects to earn dividends out of the Mackay and Revolution mines. The Montezuma Company, of Detroit, Michigan, is driving a tunnel 1,400 ft long to cut the Montezuma and Savage mines, 500 ft below the old workings. The Joab Lawrence is running for its mines by a branch off from the Illinois tunnel, through which it is expected to drain them so that they won't have to wait the better part of each season for the surface water to subside. The Emma Hill Tunnel and Mining Company, owned in Allegan, Michigan, is driving a tunnel to strike at great depth a group of claims. The tunnel is now 800 ft long.

IN THE NEW EMMA.—About two tons of 400-ounce ore was found on the 120-ft level from the shaft, and the level was being further prospected when the avalanche of last March dropped on the works out of the sky, as it were, killing the foreman and ten others. At the same time the shaft had been run down another hundred feet, and they were cutting out a station preparatory to opening a new level, 700 ft below the old Emma bonanza, but connected with it by a continuous thin sheet of rich ore. This shaft is 1,740 ft in from the mouth of Bay City tunnel.

REVIEW.—Salt Lake *Tribune*, Aug. 29: The week has been rather a dull one in mining circles. The low price of lead causes lethargy in a large number of what would, with fair prices for lead, be good producing properties. The receipts of bullion and ore in this city for the week ending August 27th, inclusive, were: Of bullion, $105,989.14; of ore, $12,840; of both, $118,829.14. For the week previous the receipts were $130,588.69 of bullion, and $9,300 of ore; total, $139,888.69. The Horn Silver product for the week ending August 27th, inclusive, was 18 cars of bullion, $54,000, which brings the total product of this mine for the year up to $1,612,000. The shipments of the Ontario for the week ending August 27th, inclusive, were 46 bars, of the value of $34,639.14; total product this year to date, $1,094,288.66,

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Kittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

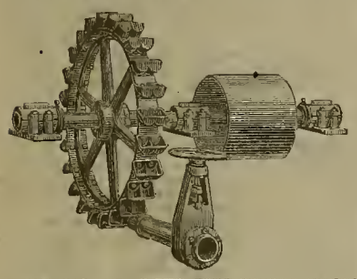
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

PELTON'S WATER WHEEL.



THIS WAS ONE OF THE FOUR WHEELS TESTED by the Idaho Company at Grass Valley, Cal., and gave 90 2 per cent., distancing all competitors. Send for Circulars and guaranteed estimates.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

HE CUTLES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF
Sporting, Cannon, Mining, Blasting and HERCULES Powder.

Send for Circular and Price List.

HOSKIN & CO.,
Marysville, Cal.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be discarded from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

Mining Share Market.

Mining stocks continue very dull, and what few fluctuations there are show a five-cent basis, very different from what used to be the case. Up on the Comstock they are delving away in hopes of striking something.

At the north end work is progressing favorably at all points where anything is being done. The deep winze below the 3200 level of the Mexican will be sunk and timbered nearly ten feet this week. This will leave about eight feet to go to reach the 3300 level. Below that level a sump about 10 feet deep will be sunk, and then a station will be opened from which to start a west cross-cut.

The Virginia *Enterprise* speaking of affairs there, says: The Chollar folks have driven west cross-cut No. 1 through to the west wall, the bearings of which have been taken, and west cross-cut No. 2, 100 feet further south, started. No. 1 cross-cut shows a great body of almost solid quartz. This quartz is of good grain and appearance and is found to be fertile, though where thus far explored the assays are quite low. As it is seen that this vast deposit of quartz in the Chollar and the Norcross, lying off to the west, is such as ore may live in, it is not unreasonable to expect that in some parts of it will be found bodies of paying ore. In tact, it is known that there is at one point, at least, on the 2,800 of the Hale & Norcross such a deposit of ore. The extent of this body of ore remains to be ascertained.

At Gold Hill the Yellow Jacket, Kentuck, Crown Point and other mines are taking out and sending to the mills about the usual amount of low-grade ore.

Bullion Shipments.

Paradise Valley, Aug. 29, $4,477; Silver City 29, $3,000; Banner, 29, $7,000; Horn Silver, 24, $6,000; Hanauer, 27. $3,550; Stormont, 27, $3,250; Horn Silver, 27, $6,000; Ontario, 27, $4,722; Horn Silver, 28, $6,000; Ontario, 28, $4.757; Hanauer, 29, $3,700; Horn Silver, 29, $12,000; Ontario, 29, $4,503; Hanauer, 30, $3,650; Crescent, 30, $2,750; Horn Silver, 30, $3,000; Ontario, 30, $6,291; Vienna, 29, $4,883; Horn Silver, 31, $12,000; Ontario 31, $4,194; Hanauer, 31, $1,850; Wood River, 31. $2,850.

During the week ending August 30th, 35 cars of bullion aggregating 887,499 pounds, and 24 cars of ore, aggregating 753,000 pounds, were shipped East from Salt Lake City.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

NORTHERN CALIFORNIA R. R. CO., Sept. 1. Capital stock, $320,000. Object, to build a railroad from Marysville, Yuba county, to Oroville, Butte county, a distance of 26½ miles. Directors—N. D. Rideout, A. J. Benney, Nicholas Luning, M. B. Langhorne and George Whittell.

EXCELSIOR DYNAMITE CO., Sept. 1. Capital stock, $1,500,000. Object, to manufacture a new explosive. Directors—J. P. Jones, Gold Hill; Fred. H. Jenssen, A. M. Starr, Charles H. Wells, J. A. Farnsworth, M. T. Dusenberry and E. W. Marston.

Sacramento Union Iron Works.

Among the first industrial establishments of importance in the history of Sacramento stands this successful foundry and machine shop. It remains almost alone among the permanent pioneer works of early days. Messrs. Root & Nielson, both practical mechanics in different departments, have long been successfully connected with the concern as proprietors, and the remarkably satisfactory work they have turned out is now doing good service in nearly every part of the country, from Idaho to Arizona, in cities, towns, mines and on farms. Having intimately known the senior member of the firm as a first-class master mechanic in Springfield, Mass., thirty years ago, we are pleased to note the worthy and well-earned success of himself and active partners.

PROGRESS IN SCIENCE.—The developments of physical science have received a wonderful impetus within the last ten years. Twenty odd years ago, according to the chief literature on opthalmology, we find very conflicting opinions entertained by many eminent physiologists regarding the pathology of the eye when accommodation was not understood nor the cardinal points of physiological dioptrics. Astigmatism of the eye is very often treated for amblyopia, amarosis, etc., while it is a mechanical defect, and can be corrected by simple or compound lenses correcting the errors of refraction. Many to this day don't comprehend the difference of refraction or accommodation. Old sight, or presbyopia, is ranked with a faulty formation, and the belief still exists in the minds of many that as a person grows older the eyes fatten. Having tested over 2,000 complicated cases of defective sight in the last three years, which I have a record of, I confidently solicit all who are troubled with painful forebodings of loss of sight and defective vision, inflammation of the eyes, to avail themselves of my professional services free of charge.

C. MULLER, Optician,
7 135 Montgomery St., near Bush St.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento Co.
A. C. KNOX—Nevada (State.)
B. W. CROWELL—Fresno and Tulare counties.
GEO. MCDOWELL—Plumas and Sierra counties.
WM. PASCOE—San Francisco.
WM. H. COOK, Los Angeles Co.
H. G. PARSONS—Idaho and Montana.
G. W. IGALLS, Arizona.
M. S. PRIME—Contra Costa county,

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at publishers' rates.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufacture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.

2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough Oil to prove what we say.

Our Oil has now been adopted as

Cheaper, More Economical and More Serviceable than Any Other Oil

On the Central and Southern Pacific Railroads, the Northern Pacific, South Pacific Coast, and North Pacific Coast Railroads, the Oregon Railway and Navigation Co., Pacific Coast Steamship Co., and all the prominent Iron Works, Saw-mills, etc., on the Coast and Puget Sound.

ADDRESS:

THE CONTINENTAL OIL AND TRANSPORTATION CO.,

CHARLES J. WOODBURY,
Manager Lubricating Department.
123 CALIFORNIA ST., SAN FRANCISCO, CAL.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING AUGUST 26, 1884.

304,062.—WHIP SOCKET, OIL CAN AND WRENCH—C. L. Bard, San Buenaventura, Cal.

304,163.—FLAMBEAU—Wm. M. Bristol, Los Angeles.

304,068.—DEVICE FOR HOLDING, CUTTING AND STAMPING PAPER—Albert Brown, Mendocino.

304,277.—LOCK AND LATCH—E. Nyswonger, Hanford.

304,029.—FEED WATER HEATER—Thos. J. Pyne, S. F.

304,136.—WINDMILL—Saunders & Bentley, San Jose.

304,245.—RULER FOR MEASURING, ETC.—H. E. Thomas, S. F.

304,054.—CAR TRUCK—Wm. Whiley, Oakland.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

INDEX.—Max Levy, S. F. No. 303,440. Dated August 12, 1884. This is an improved index which is principally useful in connection with ledgers used in book-keeping to facilitate the work of posting. It consists of shelf covers of innumerable length, having narrow sheets of paper bound into them, so as to form an independent series of these fine inner sets, having lines parallel with the back of the book. These sets are bound into the cover, so as to extend from the back to the front, lying side by side, so as to fill the space between the covers from end to end, and the leaves of each set may be lifted independently. Index letters are printed upon the lower front edges of the sheets, which are so cut as to expose them, and by the use of a stylus the leaves may be readily turned back to expose the ones below with the names inscribed thereon.

MOP WRINGER. Wm. F. Mills, Oakland. No. 303,742. Dated August 19, 1884. This is a self-wringing mop and brush attachment, and the invention consists in a means by which the mop can be wrung without handling it. The object is to provide a house implement which is adapted to wring the mop conveniently without taking it in the hands.

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE
Cheapest and Most Effective Machine
OF THE KIND NOW IN USE.
Adapted to All Grades and Classes of Ores.

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coaser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

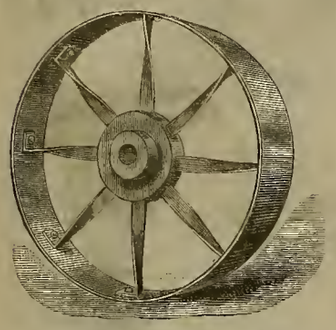
MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq. Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
(Signed:) RICHARD T. MARSH,
Managing Director.

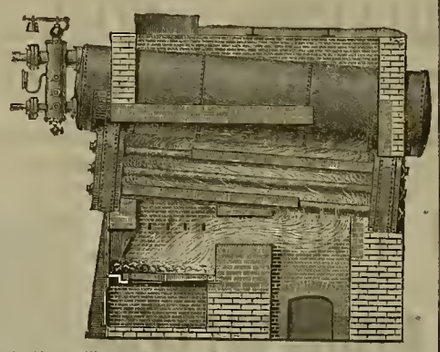
Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, MO., Sept. 23, 1883.

Messrs Adolphus Meier & Co. GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASS'N

OFFICE OF SUPT OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 24, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

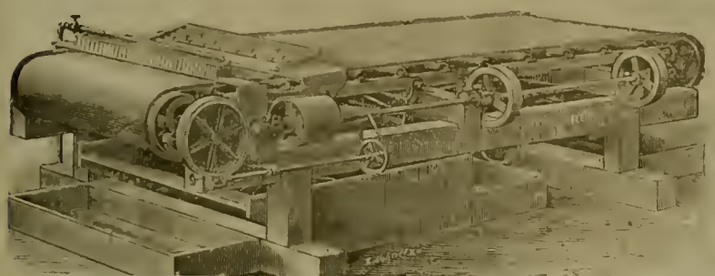
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 10 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at The Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit tried against an End Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

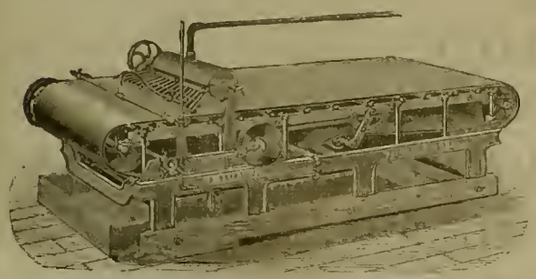
The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement upon patents owned by them.

Protected by patents May 4, 1880, Dec. 7th, 1874, Sept. 7, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 4, 1883. Patents applied for.

N. B. We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7 No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced Thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty four consecutive days, or a net gold coin result of $102.75, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test, which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, thrown by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

VOLUME XLIX. Number 11.

Town Sites and Mineral Claims.

In a certain application for patenting a mining claim in Montana, the Commissioner of the General Land Office held that the patent, if one should issue, should contain a clause reserving town site rights. The mining claim was located in October, 1874, and patent application filed August 4, 1881. The town site of Butte, near which the claim is located, was patented in 1877. A protest was filed before the Land Office setting forth that on account of the rapid growth of Butte City during the last eight years, "buildings and improvements of an expensive character have gradually extended eastward upon the public land, until at present, within the limits of what is now surveyed and claimed as the 'Lizzie Lode claim,' such improvements aggregate not less than $40,000." The protestants also declare that "until two years since we have been in ignorance of any interference with other claims." The claim was about 300 yards outside the boundary line of the town site.

In a previous decision on this subject by the Land Office it was held that a clause reserving town site rights should be inserted in the mineral patent, although in that case no application for the entry of the alleged town site appeared to have been made, it only appearing that a portion of the town in question covered the mineral claim.

The Secretary of the Interior in affirming the decision of the Commissioner of the Land Office says: "It would seem then that the Department had fairly decided that where there appeared to be a town settlement upon a mineral claim that the clause of reservation should properly go into the patent, even when such settlement was not protected by a town site entry; and that the actual rights of the claimants under the mineral location and the town settlement would depend upon priority of occupation. But in the Rico case it was held that this question of occupation must be left to courts of competent jurisdiction to settle, and that in the nature of things the Department could not be called upon to adjudicate such questions."

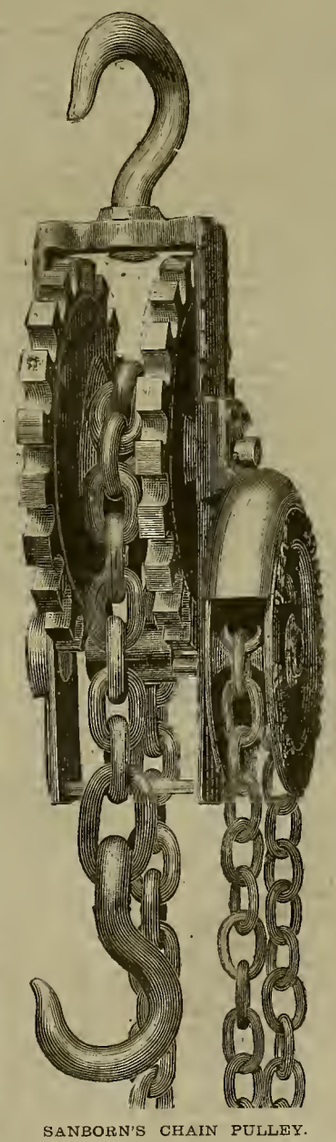
The Hale & Norcross, Savage, Chollar and Potosi Mining Companies have entered into a contract for another hydraulic pump to be set on the 3,000 level of Combination shaft. Its capacity will be 500 gallons a minute in forcing to the Sutro tunnel level, which is calculated as being 1,600 feet below the Gould & Curry croppings. The present depth of the shaft, from mouth to bottom, is 2,930 feet.

The Immigration Association reports that 700 immigrants came to this State during the past week. There were received at the association's rooms 106 samples of wheat from the different counties. The association will open a new room soon adjoining its present quarters, and here an exhibition of all the samples of different counties will be held.

The White Pine *News* says: We learn that the Cantou Company, whose property is located at Robinson, is negotiating for the purchase of the new mill of the Osceola Company. The mill cost $60,000, and is offered for sale at $10,000. If a sale cannot be made the machinery will be shipped back to the foundry at Chicago.

Sanborn's New Chain Pulley.

The engraving herewith illustrates a new lifting apparatus of that kind in which great power is necessary, and which will stand and hold the load at any point where it is left. As the engraving shows, there is a pulley over which the lifting chain passes, and upon the same shaft two gear wheels, so fixed that their teeth alternate—that is, the teeth of one wheel correspond with the spaces of the other. The pulley over which the actuating chain passes is fixed to shaft, which has short crank arms formed upon it, corresponding with the gear wheels and with the size of their teeth, so that when the shaft is rotated the crank arms or pins engage the teeth of the gear wheels, one after the other, and thus advance the chain pulley. This device also forms a perfect lock when left at any point. The frame of the pulley is made of malleable iron, and in it the gear and pulley shaft is supported, while below this the cranked driving shaft is journaled. On this cranked driving shaft, at one side, is fixed the chain pulley, having its periphery formed to prevent the driving chain from slipping. On the main shaft is fixed the double-gear wheels. They are placed side by side, and stand so that the teeth of one stand opposite the spaces of the other.



SANBORN'S CHAIN PULLEY.

The shaft carrying the driving pulley with its hauling chain has formed on it two eccentric pins or short crank arms, which stand on opposite sides of the axis of the shaft. The throw of these cranks or pins is fixed by the distance between the teeth of the gear wheels with which they correspond, so that as the shaft is revolved when the man hauls on the driving chain, the pins or cranks enter the space between the teeth alternately, and thus advance them and turn the shaft and hoisting-chain pulley. This hoisting-chain pulley is placed between the large gear wheels, which brings the weight right under the supporting book and balances the machine.

The pins or cranks in their revolutions pass over points of the teeth and into the spaces between them, without slip or lost motion, and with the least possible friction. When allowed to stand with a weight or load suspended from the chain, the pins will lie in the spaces between the teeth so as to form a perfect lock and prevent the shaft from turning back.

From the driving pulley, which is shown on one side, is the usual endless chain, which hangs within reach of the operator. There is a small hood placed over this pulley to prevent the chain coming off. It will be noticed that the operator may stand on one side and haul on the chain, and need not be right under the apparatus.

There are several features in this pulley, which in their operation appear to be important improvements over those usually made. The gear wheels are only touched once by the working crank, in each revolution, while in other geared pulleys they come in contact with the driving gear as many times in each revolution as the power is multipled. By this arrangement there is much less wear than is common. The gears are made of machine steel, while the ordinary pinions and driving gear in use is made of cast metal. In moving the apparatus, each crank is equal to half a cog. The device is simple, compact, strong and effective, and is quite ingenious in design. These machines have lately been put on the market, and are made here. The invention evidently simplifies, in a large degree, the construction of differential chain pulleys, makes them less in cost, weight, wear and repairs and easy of handling and operating. We consider the new device worthy of the attention of manufacturers and all users of such articles. The size for a half ton lift weighs only about 30 pounds.

The gold yield of Trinity county will approach very nearly to $1,000,000 for the year 1884. Much more has been taken from quartz this year than ever before.

E. D. Holland and James Gallagher, miners at Phillipsburg, Montana, were killed by a premature blast in the Granite Mountain mines a few days ago.

Prevention of Mine Accidents.

Two of the most common accidents to which miners are liable, are injuries resulting from breakage of hoisting ropes and from handling explosives. The condition of hoisting ropes at some mines are more carefully looked after: at others there is more or less neglect. Either the men appointed to look after them neglect their duty, or the ropes are run long after they should be renewed. An accident occurred at a Welsh mine recently by which twelve men lost their lives by the breaking of the hoisting rope. The matter was investigated, and it was found the wires in the rope were corroded and a large proportion of them so brittle that they broke at the slightest bending. The inspector concludes the reason the condition of the rope had escaped detection may be attributed to the fact that it was coated with a thick mixture of tar and grease, which masked the defects. In the result a verdict of "accidental death" was returned, and the jury recommended that all cages should be fitted with safety-catches; but as the inspector remarks, the question of safety-cages is not so simple as this suggestion would seem to indicate, and he adds that the conclusion that may fairly be deduced from the accident are: 1.—When human life is at stake on no account should a makeshift be resorted to. The capstan at the mine having no indicator attached its use was a decided makeshift. 2.—Every rope should be most critically examined before men's lives are trusted to it. 3.—A rope that has been subject to strains above its fair working load should never afterwards be used for raising or lowering men. 4.—The mixture of tar and grease commonly used in his district as a lubricant for steel wire winding-ropes tends to hide defects. Some more suitable material should, he says, be used, such, for instance, as a heavy mineral oil.

The Government Inspector for Cornwall, who made this examination, also gives some startling instances of the careless handling of dynamite. He states moreover, that many of the accidents which occurred in his district were owing to the instructions that accompany each box of dynamite not being sufficiently explicit. He pointed this out to the Chief Inspector of Explosives, who then called the attention of the Explosive Company to the matter, the result being an alteration in their instructions. The new instructions are: 1.—A wooden rod or squeezer should be used to push home the cartridges in the bore-hole. Never use a metal rod or rammer. 2.—Never ram or pound the charge home. It should be gently though firmly, squeezed into its place. 3.—Never squeeze the primer containing the detonation; but lower or push it gently, until it rests on the charge. 4.—Use sand or water tamping. 5.—In the event of a missfire, never attempt to draw the tamping. If water tamping has been used, put a fresh primer and detonator into the whole on the top of the charge. The explosion of the primer will set off the whole charge. 6.—If other than water tamping has been used, make a fresh bore-hole; but care must be taken to make it at a safe distance from the former hole, and in such a position or direction that the boring-tool cannot come in contact with explosive in, or escaping from, the hole that has missed fire. In all cases after a blast the material brought down, or blown out, ought to be carefully examined, lest any cartridges should remain unexploded.

The Physical Geography of California.

An Extract from Prof. Hilgard's Report.

The State of California lies between the parallels of 32° 30' and 42° north latitude, thus stretching though nine and a half degrees of latitude, corresponding to the difference on the Atlantic coast between Edisto inlet, South Carolina, and Cape Cod, Massachusetts. Its northern third lies between 120° and 124° 26' west longitude, the most westerly point being cape Mendocino, whence the coast trends southeastward, with a westerly convexity, toward San Diego bay. Between the extreme northwest and southeast corners the direct distance is 775 miles. The maximum width (between point Conception and the north end of the Amargosa range in Nevada) is 235 miles, and the minimum width (between the Golden Gate and the southern end of lake Tahoe) 148 miles. The total area of the State is 158,360 square miles. Its land area alone is 155,980 square miles, being second only to Texas among the States and Territories as now defined.

It is obvious that on this vast area the diversity of climates and of soils must be very great, and that only a very general outlining of these can be attempted within the limits of this report.

Topography and Drainage.

The climates of the several portions of the State are so directly dependent upon its topographical features, that an outline of those must of necessity precede any other discussion.

The two prominent features extending through nearly the entire length of the State are the snow-capped range of the Sierra Nevada, on the eastern border, and the low Coast range, or rather belt of ranges bordering the sea coast on the west. Between the two lies the great valley of California, drained from the northward by the Sacramento, and from the southward by the San Joaquin river, and these, uniting near the middle of the length of the valley, pass westward through the narrow strait of Carquines into San Francisco bay, and thence through the Golden Gate into the Pacific ocean. These two rivers receive nearly all their water from the Sierra Nevada, the streams flowing landward from the Coast range being insignificant. The main drainage of the Coast range is to seaward through many small rivers bordered by fertile valleys. The immediate coast is mostly abrupt and rocky, and frequently mountainous.

The maximum width of the great valley occurs opposite the outlet of the rivers, and in its southern portion, near the south end of Tulare lake, where it is over 60 miles. In its middle part the distance between the foot-hills of the two ranges averages about 40 miles; but to the northward these ranges gradually converge, the Coast range widening and becoming higher, while the Sierra narrows and, as a whole, becomes lower, though rising locally into the Lassen peaks, and culminating, as it merges into the coast ranges, in the great volcanic mass of Shasta. Northwestward the Siskiyou mountains form a cross range of considerable elevation, an effectual natural barrier between California and Oregon, while northeastward lies the barren "lava bed" plateau, with its numerous lakes. The great valley, may be considered as terminating northward at Red Bluff, Tehama county, although more or less valley land, but of a different character, occurs along the Sacramento river, as far north as Redding, Shasta county.

Southward the termination is much more definite. The Coast range and the Sierra being cross-connected, in a graceful sweep around Buena Vista and Kern lakes, by the Tejon range, beyond which to the eastward lies the great arid plateau of the Mojave desert. This range continues southward into the ranges of San Fernando, San Gabriel, and San Bernardino, all of which are often comprehended under the general but somewhat indefinite name of Sierra Madre, also applied far to the southward to the mountains representing the continental divide; but it would be better to comprehend the whole under the name of the San Bernardino range. Southward of this range lies the valley or plain of southern California, most of which is within the county of Los Angeles, with an outlier in the southwestern corner of San Bernardino, and is partly screened from the direct impact of the coast winds by a low coast range, the Santa Ana mountains, which is, however, traversed by the country drainage from the higher ranges. Toward San Diego county this coast range divides into a broad belt, dotted with smaller ranges and interpersed with valleys and table-lands, about 30 miles wide from the coast inland to the Mexican boundary.

Northward of the San Bernardino range lie the great Mojave and Colorado deserts, mostly high barren plateau lands, intersected by short abrupt mountain ranges, devoid of streams, and largely composed of sandy and "alkali" soils incapable of reclamation. To the northwest from the desert region numerous short water-courses descend from the steep eastward slope of the Sierra; but, although they create some fertile valleys adapted to agriculture, their volume is very small compared to the drainage of the western slope.

Geology.

Broadly speaking, the coast ranges of California consist of tertiary and cretaceous strata (mostly sandstones and calcareous clay shales), almost everywhere greatly disturbed, folded, and frequently highly metamorphosed, and traversed by dikes of eruptive and upheaval-axes of rocks. In the portion north of San Francisco these are frequently covered by tufaceous and scoriaceous or crystalline lava-flows, emanating from distinct volcanic vents now extinct.

In contrast to the Coast range, the Sierra Nevada has in general a central axis of granitic or other rocks (occasionally traversed by volcanic vents), on the flanks of which lie more or less crystalline and metamorphic slates or schists of Paleozoic, Triassic, and Jurassic age with edges upturned at a high angle or sometimes vertical. Abutting against this, the proverable "bed-rock" of the California miners, there lie on the eastern border of the great valley strata of marine deposits, mostly of the Tertiary, but northward of Folsom, Sacramento county, also of the Cretaceous age, which are but slighty disturbed, and into which the rivers flowing from the canons of the Sierra have cut their immediate valleys, flanked by bluffs from 40 to 70 feet high. From Tuolumne county northward, on the lower foot-hills, appear immense gravel beds, mostly gold-bearing, and these are partly overlaid by eruptive or volcanic outflows and tufaceous rocks, also accounted as belonging to the Tertiary age. In the northern portion of the Sierra region the eruptive rocks become more and more prominent, covering an enormous area ("the lava-bed") in the northeastern part of the State, and, as in the Cascade range in Oregon, forming the body of a comparative low range upon which the volcanic cone of mount Shasta is superimposed.

Apart from the Cretaceous and Tertiary beds on the borders of the great valley, there are within the valley terraces and bench-marks showing the existence in Quaternary times of a great fresh-water lake, which was subsequently drained by the erosion or breaking, first, of the strait of Carquines, and ultimately of that of the Golden Gate. Prior to the latter event the drainage of the great valley passed through the Santa Clara and Pajaro valleys into the bay of Monterey. Borings in the interior valley disclose materials varying from fine silts to sands and gravels, evidently deposited in the ancient lake. The latest surface deposits are, in the San Joaquin valley, mostly sandy, in the Sacramento valley more commonly clayey (adobe), corresponding to the composition of the coast ranges themselves, which in their interior southern portion show sandy materials more prevalently, while in the middle division clay shales are predominant, and form correspondingly heavy soils.

Since the agricultural features of California depend much more upon the topography than upon any details of geological structure, a more extended discussion of the latter would be out of place here. So far as relevant to the objects of this report, they will be referred to in the regional and county descriptions.

Winds.

The prevalent winds on the California coast are from the west, the influence of the Pacific ocean thus producing a climate in which the extremes of both heat and cold belonging to the several latitudes are tempered, so that on San Francisco bay and southward to Monterey the difference between the average temperatures of summer and winter is only from six to ten degrees. This equalizing effect is partly cut off from the interior valley by the Coast range, which also intercepts a portion of the moisture carried by these winds; the remainder is condensed mainly on the western slope of the Sierra Nevada, thus producing the arid continental climate of the interior plateau of Nevada. In the great interior valley the general direction of these winds is changed to "up-valley", that is, to a little west of south in the Sacramento valley and slightly west of north in that of the San Joaquin, a heavy westerly breeze blowing in, as a rule, through the joint outlet of both valleys, the straits of Carquines.

North of Cape Mendocino the direction of the prevaling currents is more from north of west, but south of the cape the direction is due west or slightly south of west, forming the "summer trade winds," which set in regularly some time in May and continue, with but an occasional interruption by a "norther," until October, laden with moisture from the warm, high seas. In summer these winds strike the cold Alaskan ocean current, which comes to the surface and sets in-shore off central California, producing dense fogs, which, during the summer months, frequently cover the coast country for twenty out of twenty-four hours for weeks together. Beyond a slight drizzle, however, no water falls; and as the fog banks drift against and up the slopes of the Coast range they dissolve quickly before the intense heat and dryness of the summer atmosphere in the great valley beyond. The moisture absorbed by the soil of the coast belt from these fogs goes far, however, toward maintaining the growth of the hardier herbaceous as well as of woody plants, no less than that of weeds, during the season of drought.

From May to October, both inclusive, south winds are very rare, but during the winter months they prevail largely, and bring the rains upon which the success or the failure of crops depend. The winter rain-storms are usually heralded by heavy weather in Oregon or in the Shasta region, whence the rain-wind works backward, so to speak, until it exhausts itself in the southern part of the San Joaquin valley, where the San Fernando range seems to form a partial weather divide, leaving the Los Angeles region more or less independent of the changes to the northward. Sometimes the rain-storm works chiefly down the coast leaving the great valley almost dry, in which case Los Angeles and San Diego usually get a fair proportion of its benefit. Sometimes prolonged and severe storms cover the entire State and extend far into British Columbia and Arizona. As thunder and lightning rarely form a part of the atmospheric disturbance, the rain usually falls gently and continuously, rather than in torrents, and thus chiefly soaks into the ground. Sometimes a fierce south wind drives it for a day or two, and then generally there comes a change; the wind gradually veers to the westward, then more rapidly to northwest and north, and with a heavy shower the sky clears suddenly and a "norther" sets in; though not ordinarily bringing a very low thermometer, it often feels bitingly and penetratingly cold, because its velocity and dryness, which cause rapid evaporation. Before the "norther" the surface moisture quickly disappears, muddy roads become as rough as if frozen, and compact ground cracks after a few days. Any long prevalence of this wind is looked upon with dread at all seasons, on account of the waste of moisture which it involves even when cold. In autumn and in spring, when its temperature is higher, the young grain often withers before it, and from May to September (when it is fortunately of rare occurrence) it sometimes becomes a veritable simoon, like the breath of a hot furnace, shriveling up the grain when in milk and sometimes almost curing the standing crops into hay. To the seaward of the Coast range the "norther" is rarely of long duration, three days being its ordinary limit; but in the great valley, and especially in the valley of the San Joaquin, it is both more frequent and persistent, occassionally blighting in a week all the hopes of the grain-grower not able to resort to irrigation, and even drying fruit on the trees. East winds are only of brief and local occurrence, being ordinarily cut off by the mountain ranges in their north and south course. They are usually the precursors of a "southwester," with rain.

Outside of the mountains the velocity of the wind rarely becomes so great as to endanger any well-constructed wind mills, which are therefore very generally in use as a motive power, especially for pumping water. In the absence of electrical disturbance hurricanes and "tornadoes" are scarcely known, save in the high Sierras, where local summer thunder-storms, sometimes accompanied by cloud-bursts, may be observed among the high peaks, in curious contrast to the unclouded brightness of the sky overhanging the valley.

Temperature.

The prominent characteristic of the California coast in respect to temperature is its remarkable temperateness as compared with points similarly located on the Atlantic coast. Taking stations at or near the extreme and middle points of corresponding latitude on both coasts, the comparison stands thus:

CALIFORNIA COAST.

Stations.	Summer.	Winter.	Year.
Camp Lincoln	59.5°	47.2°	53.9
San Francisco	58.0	50.1	65.2
San Diego	69.7	54.1	62.1

ATLANTIC COAST.

Stations.	Summer.	Winter.	Year.
Boston, Massachusetts	68.7°	28.1°	48.4
Cape Charles, Virginia	74.3	35.8	56.0
Edisto, South Carolina	81.0	46.6	64.3

It will be noted that while the annual averages of corresponding points on the two coasts are not very widely different, the temperatures of summer and those of winter are very much farther apart on the eastern coast than on the western, and quite as strikingly so in the northern as in the southern portion of the respective regions. This exemption from extremes of temperature constitutes one of the great attractions of the Pacific coast.

In the interior, notably in the great valley, the seasons show greater extremes of temperature, but the greater range of the thermometer is largely offset by the fact that the dryness of the atmosphere renders the changes much less sensible than is the case in the moister air of the coast. It is thus at San Francisco, which presents the extreme of the coast climate on account of its peninsular position and the access of the sea air through the Golden Gate, those familiar with the climate making a careful distinction between the sunny and the shady side of the streets in walking, and hay windows, of necessity, take the place of porticoes or porches, which would rarely be available save in the middle of the day, while in the interior, porticoes are universal, and camping out under a tree all night may be indulged in with impunity by any one during the dry season.

As to the change in temperature in ascending the Sierra from the valley, the following statement is made by Mr. B. B. Redding in a paper read before the California Academy of Sciences in 1878:

It has been found that the foot-hills of the Sierra up to the hight of about 2,500 feet have approximately the same temperature as places in the valley lying in the same latitude. It has also been found that with increased elevation there is an increase of rainfall over those places in the valley having the same latitude, as, for instance, Sacramento, with an elevation above the sea of 30 feet, has an annual mean temperature of 60.5° and an average rainfall of 18.8 inches, while Colfax, with an elevation of 2,421 feet, has an annual mean temperature of 60.1° and an annual rainfall of 42.7 inches. This uniformity of temperature and increase of rainfall appears to be the law throughout the whole extent of the foot-hills of the Sierra, with this variation as relates to temperature, viz., that as the latitude decreases the temperature of the valley is continued to a greater elevation. To illustrate, approximately, if the temperature of Redding at the northern end of the valley is continued to the hight of 2,000 feet, then the temperature of Sacramento, in the center of the valley, would be continued up to 2,500 feet, and that of Sumner, at the extreme southern end of the valley, to 3,000 feet.

It is curious to note that, as appears from Mr. Redding's statement, the lowest temperatures thus far observed at the two opposite ends of the valley, Redding and Sumner, are the same, viz., 27°.

In the southern region the difference between the summer means or between winter means, as well as between the annual means, is quite small when Santa Barbara and San Diego, both lying immediately on the coast, are compared. At Los Angeles, 20 miles inland, all these means are notably higher; still farther inland, and with increasing elevation, the summer mean rises, while the winter mean falls at Riverside, as well as more strikingly at Colton, although at the latter point the annual mean is almost the same as at Los Angeles.

To convey an easily intelligible idea of some of the climatic differences, it may be stated that while in the great valley a few inches of snow cover the ground for a short time nearly every winter as far south as Sacramento, and snow flurries are occasionally seen even at the upper end of the San Joaquin valley; snow has fallen in the streets of San Francisco only once since the American occupation to such a depth as to allow of snowballing (which, during a few hours, create a state of anarchy) and only a few times has enough fallen to whiten the ground for a few minutes or hours. Hence the heliotrope, fuchsia, calla lily, and similar plants endure year after year in the open air, while at a corresponding latitude in the interior they require some winter protection. Lemon and orange trees never suffer from frost on the bay, but their fruit also rarely ripens, save in favored localities. In the interior these trees more frequently suffer from frost, but the high summer temperature matures the fruit some weeks earlier than even in the southern coast region. Cotton would, as a rule, be frost-killed in the great valley in November, while on the coast in might endure through several mild winters; but within reach of the summer fogs of the coast it fails to attain a greater hight than eight or ten inches the first season, and sometimes can scarcely succeed in coming to bloom before October. Subtropical trees, which in the cotton States grow rapidly and luxuriantly—such as the crape myrtle, Paulownia, Catalpa, Mimosa (*Julibrissin*), and others—either grow very slowly or remain mere shrubs in the coast climate, while in the interior they develop as in the Gulf States. The vine flourishes near San Francisco, but fails to mature its fruit; yet it yields abundant and choice crops near San Jose, where the immediate access of the coast fogs is intercepted by a range of hills. It is thus obvious that, with the varying topography, the change of the direction of a valley or a mountain range, the occurrence of a gap or of a high peak in the same, permitting or intercepting communication with the coast on the one hand, or with the interior on the other, there exist innumerable local climates, "thermal belts," sheltered nooks and exposed locations, each of which has its peculiar adaptations apart from soil, and the recognition and utilization of these adaptations require knowledge and good judgment, and count heavily in the scale for or against success in agriculture in California.

Rainfall.

As regards the rainfall, the prominent peculiarity throughout the State is the practically rainless summer. While it is true that rain has been known to fall in every month in the year, the average amount of precipitation during the three summer months is less than one inch in the greater portion of the State, and less than two inches even in the most favored part, viz., the counties just north of San Francisco bay. Frequently not a drop of rain falls in the interior valley and the southern region from the middle of May to November, and as the agricultural system of California is based upon the expectation of this dry weather, summer rains are not even desired by the farmers at large. Northward, in the mountainous and plateau regions adjoining Oregon, the season of drought becomes shorter, as is also the case in the high Sierras, and thus there is a gradual transition toward the familiar *regime* of summer rains and occasional thunder storms which prevail in Oregon and Washington west of the Cascade range.

DURING the year ending April 1, 1884, the Copper Queen Mining Company (Arizona) smelted 33,941 tons of ore, averaging 11.26 of black copper, produced and marketed at a cost of 9.37 cents per pound. The net value of the bullion produced at New York was $1,033,045.62, upon which the net profit was $342,946.07. To pay $400,000 in dividends, the company, therefore, drew in part on its reserve, which at the end of the fiscal year was $159,974.58. This report is interesting, as showing what margin of profit there is in 11.26 per cent copper ore in Arizona.

MECHANICAL PROGRESS.

Driving by Friction.

For many purposes for which gear wheels were formerly used, surface friction wheels are now employed. If the surfaces are properly matched as to material, and are sufficiently large as to area, there appears to be no reason why friction wheels cannot be more extensively employed than they have been heretofore. One of the objections has been that there must be an end thrust, which by its friction absorbs much of the power. It is a baseless objection, as may be seen in the friction clutch of the overhead counter-shaft of the lathe, and in many other situations where the release of the friction is the easiest and most natural movement. To be sure, in this case the amount of contact is very large (the entire circumference of the pulley), but the principle is the same; for where the pulley friction clutch must be held as a one with the moving pulley, so the friction wheels are one so long as they are in contact, and their contact is a mere point against the circumferential contact of the pulley clutch.

An objectionable method of employing the friction driving is to use a metallic surface against a wooden or a leather surface. Two surfaces of wood are better; but if iron and leather or iron and wood are used together, the driver should, in all cases, be made of the softer material, for when the driver is thrown in contact with the driven, it must make a number of revolutions before its contact will be sufficient to start the driven wheel. It is evident, therefore, that if the driver is of iron while the driven is of some softer substance, it (the driver) will wear a crease that will injure the surface of the driven wheel. It is much better, where it is practicable, to make both the driving surfaces of wood.

Excellent wheels are made of maple—hard rock maple—and of lignum vitæ, the lignum vitæ wheel to be the driven and the maple the driver. The wheels should be a cast-iron spider made to receive the wood, which should be sawed into wedge-shaped or radial segments, so that the end grain of the wood bears and makes the contact surfaces. Excellent results have been obtained, also, with hard rubber (vulcanized) and wood, where there was no oil to rot the rubber; and for small wheels there is nothing better than rawhide as prepared for pickers for looms and for small gears. This will stand oil and resist its disintegrating influence.

One of the advantages of friction wheels over cogged wheels is that when they are started there is no shock, but only a gradual coming up to speed. Another is their noiselessness; but the epicycloidal cutting of gear teeth latterly has made this objection untenable, as gears can be run as silently as belts. But a great advantage is the very slight movement necessary to connect and disconnect, the actual surfaces requiring to be merely and barely separated to insure a stoppage of motion.

Variations of Speed.

In connection with the above, which we clip from the *Scientific American*, we copy the following from the same paper, in regard to variations of speed by the use of friction: The contrivance of step cones with shifting belts is a cumbersome and troublesome one for procuring gradations of speed. In many cases it answers its purpose, but in others some more sensitive and intermediate device would be better. A change of speed is readily obtained by a change of position of a driven friction wheel on the face (side) of a driver wheel or disk. The face of this disk may be either straight or slightly dished, and the driven roll or small pulley traverses the face of the disk from the shaft to circumference. It is evident that while the driven wheel is nearest the shaft of the disk it will revolve the slowest; and also it is evident that as the driven wheel is run out toward the circumference of the disk it will revolve the faster.

The shaft of the driver—the disk—is, of course, at right-angles to that of the driven pulley. These relative positions must be maintained. But it does not matter, in practice, whether the disk is on a horizontal or a vertical shaft, so long as the driven is so arranged as to be permitted to be placed in contact with the disk at any point from center to circumference.

This device, with some modifications, has already been employed in the machine driving of potters' wheels and in the foot driving of sewing machines. But it is capable of a wider adaptation, especially in the machine shop, where sudden changes or quick variations of speed are frequently necessary. The large disk may be of cast iron, turned and finished, and the driven wheel of iron, leather faced, or of wood. The progress of the driven wheel from shaft to circumference of the disk—from low speed to high speed—could be controlled by lever, worked by hand or by foot treadle. It is a much closer and more sensitive device than the present system of absolute changes of speeds on our lathes and drilling machines.

ELIMINATING GASES FROM STEEL INGOTS.—A new and simple device has been introduced for the elimination of gases from steel ingots, during the process of casting. This is done by leaving the upper surface of the ingot mold open and freely exposed to the atmosphere and at the same time so shaping the ingots and ingot molds that this upper surface is the largest or nearly the largest surface of the ingot, the ingot itself forming a comparatively thin layer of steel which form ingots of Siemens-Martin or Bessemer steel have hitherto been made. The result of this process is that the gases carried into the ingot mold with the fluid have but a short distance to rise before reaching the upper surface of the ingot and making their escape, so that the steel solidifies practically free from those gases. The advantage thus gained is obvious, for no hammering is required before rolling, as the ingots only require to be reheated before they are passed through the rolling mill. The device has been patented in England by Messrs. William Beardmore and James M. Cherrie, who claim in their specification the casting of steel into ingots of a shallow or flat shape, so that there is in the ingots a thin or shallow, as distinguished from a thick, depth or length of liquid steel through which the gases have to escape, and whereby the escape or elimination of the said gases is substantially facilitated.

Preservation of Cast Iron.

The common practice of painting the unfinished portions of machines is not very attractive, and that of making all cast iron of some uniform color for all machines is almost offensive. In most cases the use of paint on the cast iron is intended to make a contrast between the unfinished material and the polished parts; incidentally, it is also to prevent oxidation and a blotchy appearance. But if the oxidation is general and even, and permanent, nothing could be finer; for the red oxide of iron is even more agreeable to the eye than the blue green oxide of copper or bronze, which is so much admired. There is no question about the durability and the permanency of iron oxide in color and texture any more than that of bronze or brass; the browned gun barrels of fowling-pieces are instances.

Experiments have been made to avoid the daily annoyance of paint by less mechanical means. The cast iron, after being pickled to remove the scale, was left to dry with the acid still on it. Then it was cleaned with a wire brush, and scraped with a coarse file. The result was a mottled surface, the lower portions being a grayish brown, and the outer or upper portions bright. The surface was then swabbed with crude petroleum, and before it was dry was rubbed with a wire brush. Such treatment insures an unchangeable surface and gives an agreeable color. Even without the petroleum the rust of the acid insures a very pleasing and permanent effect; but the petroleum prevents after stains, and mellows and blends the tints. In either way used it is an improvement on paint. Cast iron has a beauty of its own that is no more dependent on paint than that of bronze or brass.—*Exchange.*

STEEL MADE AND RE-WORKED.—Some tests have been made of steel from the roll and from the hammer as compared with steel that is annealed and turned to size. It appears from these tests that the commercial steel, untouched by annealing heat, or by the turning tool, is better in its resistant qualities than the annealed and turned material. Unannealed steel is tougher—it resists torsion better—than annealed steel. This fact was constant through a large number of tests of the steel made by five of the most prominent and best known manufacturers. Further trials proved the fact that steel as it comes from the hammer is better for certain tools than the same steel annealed, turned, and after worked. A square bar of commercial steel centered and cut to thread made a better tap than the same bar annealed and turned round, and then four-scored and re-tempered. It is possible that for certain tools—lengthwise tools—as taps and reamers, steel might be forged in bars to size and shape, with advantage, not alone as to saving of lathe work, but as to value of the finished tool. If steel makers can be induced by sufficient orders, it is probable the experiment will be made on a scale large enough to establish the question of its value. The claim of those who have made the tests is that the "skin" of the steel as it comes from under the hammer is stronger than any after coating by the oxidizing of tempering. —*Scientific American.*

TURNING BESSEMER STEEL.—A job in a machine shop of Bessemer steel worked in the lathe with the ordinary turning tool would not come out right; the material appeared to lack tenacity, it crumbled when brought up by the turning tool to an edge. As an instance, some axles for cars on an elevated railroad were scored circumferentially. They were made of excellent Bessemer steel. The scores, somewhat more than a quarter of an inch deep, were turned in the usual way, but before the vees could be finished to a depth of about five-sixteenths of an inch, the metal crumbled at the top of the vee, and the entire job had a ragged look. It was found that the only way to do a good job on this material was to make a collection of toothed mills, and mill the scores instead of turning them. If the axles had been made of tenacious material like Norway or Lowmoor iron, there would have been no difficulty in cutting clean vee scores possessing all the toughness of the solid material.

A NEW PROCESS IN SHOT MANUFACTURE.—A new process in shot making will do away with the tall towers. A strong current of air is forced on the lead as it falls into the water.

SCIENTIFIC PROGRESS.

A New and Valuable Solvent.

What is said to be a valuable preparation in which petroleum forms the chief ingredient has recently been patented in England. The invention relates to the production from petroleum of a substitute for bisulphide of carbon which can be used for extracting oils and anthracine, for dissolving gums, resins and analogous substances, for water-proofing, and for vulcanizing india-rubber in conjunction with chloride of sulphur or other vulcanizing agents. To obtain the improved substitute, which is called "vulcoleine," the distillate or fraction from petroleum which passes over between the temperatures of 100° and 212° F. or thereabout (the fraction known as spirit or naphtha) is taken and treated in the following manner: To every 100 gallons of petroleum is added from two to three gallons of sulphuric acid with constant agitation, continued as long as may be necessary, in a suitable vessel; it is then allowed to subside, and the liquor decanted from the sediment is run into a still with from one to two per cent of its weight of lime or other dehydrating medium, calcium carbonate or other alkaline carbonates or oxides of metals capable of removing or destroying any sulpho-oils which may have been generated by the treatment with sulphuric acid. The distillation is conducted without injecting steam or water into the contents of the still. Sometimes before distilling, the liquid is submitted to repeated treatment with fresh sulphuric acid until the acid ceases to be colored, or nearly so. As the distillate comes over, the receivers are exchanged as soon as the product which is coming over reaches a specific gravity from about 680 to 690, water being taken as 1,000. By these processes the portions of petroleum unsuited for a substitute for bisulphide of carbon are removed and considerable economy is thereby effected, both in material and bulk of liquid to be operated on.

THE CAUSE OF EARTHQUAKES.—A good deal of thought has been expended in weaving theories to account for earthquakes, without any of them being entirely satisfactory. Professor Newcomb thinks he explains the cause when he says: "The fluid matter beneath the earth's surface in cooling contracts, leaving a vacant space between it and the solid portion, causing the heavier parts above to sink, and an earthquake results." Professor George H. Merriman, of Rutger's College, New Brunswick, has also a theory on the subject. It is this: The crust of the earth floats on and imposes an immense weight on a liquid substance, which is inconceivably hot. Now, as to the way an earthquake may be caused. Suppose moisture trickled gradually, year after year, through this crust into the heated mass. In our atmosphere steam would be produced. Thirty miles below us the pressure is so great that it is not likely that steam could be generated. One thing, though: the pressure of 10,000 tons to the square foot, a pressure exerted in every direction, would be increased. Some effect must be produced down there, and it is easy to see that if one place in the earth's crust is weaker than another near the region where the water trickled in, "the weakest place must stand the strain." It is not unreasonable to suppose that this pressure below might be so great that the earth's covering was shifted a little to adapt itself to the pressure from below. This shifting of the crust is, in fact, the earthquake. I believe this theory has the greater reason on its side, because earthquakes are almost always in the region of volcanoes, and volcanoes are almost always in or near the ocean.

INVISIBLE WIRE.—Platinum wire has been drawn so fine by H. F. Read, of Brooklyn, as to be invisible to the naked eye, although its presence upon a perfectly white card could be detected by the touch, and could be seen with the aid of a small magnifying glass when the card was held in such a position that the wire cast a shadow. A small platinum wire about No. 18 was inclosed in a close fitting tube of silver. The tube was made by taking a long and narrow sheet of silver, about one-twentieth of an inch thick, folding it over into a cylinder, and drawing down until the wire would just fit in it. This was then drawn down until the tube containing the wire was only as large as the original wire. A short length of this was cut off, and incased in a second tube of silver, which was drawn down in the same way. This operation was repeated until the platinum wire had been reduced sufficiently in diameter. The last wire was drawn as fine as the dies would permit, when the silver coating was removed by an acid. During the work it was necessary occasionally to anneal the wire. It was designed to be used for cross wires in telescopes, its opacity and fineness rendering it particularly applicable, but its extreme weakness made its handling almost an impossibility.

A SCIENTIST'S CHEERFUL WORKSHOP.—A biography of Louis Pasteur, just completed by his son-in-law, gives the following description of the surroundings of the great French investigator at his daily work: All the animals in the laboratory, from the little white mice hiding under a bundle of cotton wool to the dogs barking furiously from their iron railed kennels, are doomed to death. These inhabitants of the place, which are marched out day after day to be subjected to operations, or other experiments, share the space with still more ghastly objects. From all parts of France hampers arrive containing fowls which have died of cholera or some other disease. Here is an enormous basket bound with straw; it contains the body of a pig which has died of fever. A fragment of a limb, forwarded in a tin box, is from a cow which died of pneumonia. Other goods are still more precious. Since Pasteur two years ago went to Pauillac to await the arrival of a boat which brought yellow fever patients, he receives now and then from far-off countries a bottle of black vomit. Tubes of blood are lying about, and plates containing drops of blood may be seen everywhere on the work tables. In special stores bottle-like bladders are arranged. The prick of a pin into one of these bladders would bring death to any man. Inclosed in glass prisons millions and millions of microbes live and multiply.

SALICYLIC ACID IN BEER.—Some interesting experiments by Heinzelmann have been published, which offer additional proofs of the value of salicylic acid as a preservative agent, for they show that this antiseptic, when used judiciously, really strengthens and encourages the growth of yeast. The author's experiments show that, although the vitality of the yeast is completely destroyed by the presence of 0.05 per cent of salicylic acid, the addition of only 0.01 per cent actually favors its greatest activity, and further, that the yeast cells developed in the presence of this proportion of salicylic acid are stronger and larger than those produced in a solution free from this acid; moreover, the production of alcohol in a given time is said to be greater. The addition of one part of salicylic acid to 10,000 parts of the mash is said to favor fermentation, especially when sugar is used. In two series, each of three experiments, Ladrean employed (1) beer alone and beer mixed respectively with (2) 100 and (3) 200 grains per barrel. The three beers were exposed to the air for two weeks, and subsequently closed up for a month, after which period they were examined. The beer 1 without salicylic acid was sour, beer 2 was only slightly sour, and beer 3 not at all. To complete the investigation, the salicylated beer was employed for dietetic purposes for several weeks without any deleterious effect on the health of the experimenter. It is therefore clear that the addition at most of 250 grains (about one-half ounce) per barrel preserves the beer without affecting its use as a beverage. The author defends the use of salicylic acid, and maintains that a prejudicial amount would never be added, owing to the facility with which salicylic acid may be accurately estimated.

A HOUSE OF THE STONE AGE.—A very interesting discovery of a house of the stone age was recently made in a marsh at Schulsonried, in Wurtemburg. The house or hut was still preserved; the flooring and a part of the walls were intact, and, as appeared from a careful admeasurement, had formed, when complete, a rectangle, 32x23 feet. The hut was divided into two compartments, communicating with each other by a foot-bridge made of three girders. The single door, looking toward the south, was about three feet wide, and opened into a room 19 feet long by 12 feet wide. In one corner lay a heap of stones, which had apparently formed the fireplace. This room was the kitchen, "the living-room," and probably a night refuge for the cattle in cold weather. The second room, which had no opening outside, measured about the same, and was, no doubt, used as the family bed-chamber. The floors of both rooms were formed of round logs and the walls of split logs. This, be it remembered, was a hut of the stone age. It may be safely presumed that the lake dwellings of the bronze age were larger in size and less primitive in their arrangements. At both periods the platform supporting the houses communicated with the shore by means of a bridge (probably removable at pleasure), and with the water by ladders. These ladders, as appears from an example found at Chavannes, were made of a single stang with holes for the staves, which protruded on either side.

A NEW MOTOR.—The scientific commission of the Vienna Electrical exhibition has recently made very satisfactory trials with a so-called "Hock motor," manufactured by Messrs. Hock & Co., of Vienna. The motor consists of an air-tight fireplace, whose fire is fed by compressed air; water is injected into the resulting gases of combustion, and the resulting mixture of steam and combustion products, which the inventor calls "air steam," is led directly into the engine. We have therefore machinery without a boiler. The results of the trials were exceedingly gratifying. The machine, of six normal horse power, developed 12.23 effective horse power, with a consumption of coal of 2.2 pounds per hour for each effective horse power.

THE late Java earthquake has been minutely studied by a Dutch engineer, officially sent out by the government, and his report gives most interesting details respecting the causes and effects of the volcanic eruptions in Sunda straits. Beginning on August 26th, they attained their maximum on the 27th, when the sound of the reports could be heard in Ceylon and Australia, thus traveling over a surface of 2,049 miles, and forming a circle representing the fifteenth part of the whole surface of the globe.

Passing Events.

The latest mining news of moment is the discovery of gold fields on the Little Rocky Mountain, about 100 miles east of Benton, Montana. Already a stampede has set in, and some tall stories are telegraphed about the diggings.

Another hydraulic pumping outfit has been ordered in this city for the Hale & Norcross, Savage, Chollar and Potosi mining companies, on the Comstock. It is to handle 500 gallons of water a minute. These pumps, at first distrusted, are found to work well and economically. The Combination shaft is already equipped with hydraulic machinery down to the 2800 level, and with the new pump the system will be extended to the 3000-foot level.

The local Mechanics' fair has closed, and the State fair at Sacramento is in full progress.

The people of California, on Tuesday, celebrated the anniversary of the admission of the State into the Union by a holiday. The corner-stone of the new building, in this city, for the use of the Society of California Pioneers was laid with appropriate ceremonies.

ASSESSMENTS due on mining stocks this month in this city aggregate $203,550. Of this amount the mines of Nevada call for $156,500, of California $35,000, and of Utah $4,000.

THE assessment now due on the Utah mine stock, is the fiftieth levied; that on the Alta is the thirtieth.

Antimonial Ores.

Among the metallic and other minerals found associated with auriferous rocks, is antimony. With gold or antimonial ores it is possible to extract both the gold and the antimony. If antimonial ores are burned in kilns or roasting furnaces, either for the purpose of rendering the quartz more friable, or for getting rid of the antimony minerals, there is always a partial reduction when the heat is very great and free access is given to atmospheric air. This reduction of ore producing metallic antimony is due to two causes—(1) the carbon of the fuel coming in contact with antimony oxide, either native oxide or that produced on the furnace by the oxidation of the sulphide, reducing it to a metallic condition; (2) by the action of the oxide on the sulphide, producing sulphurous acid and metallic antimony.

Metallic antimony has a great affinity for gold. It forms an alloy either when the two metals are melted together or when the vapor of antimony is passed over heated gold. The alloy produced is gray in color and very brittle, and amalgamates with mercury only after long contact and continual grinding, or by heating the two together. The amalgam when formed floats on mercury, and gradually gives up metallic antimony as a fine powder when agitated with water. This antimonial powder carries off a quantity of mercury and gold amalgam entangled with it.

Antimonial sulphide is one of the worst minerals with which the quartz worker has to deal. It divides the mercury into a black "flour" even more quickly than arsenical pyrites; and if the flour is triturated with the intention of bringing the globules of mercury together, a chemical combination takes place. The mass gradually changes color, passing from the original blue-black or dark gray to a pure black, and then through brown to a brown-red. Upon examination, Cosmo Newberry finds that the remaining mercury contains antimony, and that the brown-red, non-metallic portion consists of a mixture of undecomposed antimony sulphide and mercury sulphide. Sodium amalgam he finds worse than useless in bringing together the globules of mercury floured by antimony sulphide.

The process adopted by the Costerfield Co. (Victoria, N. S. W.) for treating these ores, consisting of sulphide and brown and white oxides of antimony, is as follows: The portion of the ore free from quartz is picked out and set aside for smelting, the remainder being crushed to extract the gold. The tailings are then conveyed to heaps and prepared for smelting by a process of puddling. A sluice-box is fed with tailings, which pass on to a triangular tray, forming an inclined flume, so arranged as to cause the water and tailings to flow over it in a broad, shallow stream, into an oblong receiving pit. The purest antimony ore, from its greater specific gravity, settles in the pit at the end nearest the tray. As the sediment recedes from this end it gradually becomes mixed with an increasing proportion of sand; but much of the latter is carried away in the overflow of water from the pit.

On cleaning out the receiving pit, that portion of its contents containing quartz sand is returned to the heaps, to be again passed through the buddle, and the pure ore is collected in bags and sent to the boiler-house to be dried. It is then placed in a smelting furnace, with equal proportions of uncrushed ore, and reduced to crude antimony (sulphide), the slag and cinder resulting from this process being further treated by roasting or calcining in a reverberatory furnace to liberate the oxide, which passes off in fumes from the furnaces into the oxide flue; and as the fumes cool on their passage to the smoke-stack, the oxide is deposited in chambers constructed in the flue to receive it. The residue from the reverberatory furnace is afterwards crushed to extract any gold it may contain. The gold obtained from the mineral defrays the whole of the company's working expenses, and the yield of crude antimony and oxide is clear profit. The ore yields about 45 per cent of crude antimony.

The process adopted for treating auriferous ores containing antimony sulphide, by fusing the sulphide with a portion of metallic antimony, and using the same metal with fresh charges of the ore, until it becomes rich in gold, and then separating the two metals by the oxidation of the antimony, while suitable for rich antimony ores, will not answer for those containing less than per cent of the sulphide, as they are too silicious to fuse. Hence, only large quantities of poorer auriferous antimony ores do not yield half than gold to ordinary processes, and do not return any antimony when worked for gold.

According to Lock, Mr. Cosmo Newberry has introduced the following method for treating such ores, which may also contain gold, silver, nickel, cobalt, sulphur and arsenic. The uncrushed ores are placed in a kiln or furnace with a quantity of salt sufficient to produce the amount of chlorine necessary to get rid of the sulphur, antimony and arsenic. As soon as the calcination commences a supply of steam or aqueous vapor is conducted to the bottom of the kiln or into the furnace, in such quantities as to keep the whole mass saturated. That it is so saturated is ascertainable by holding a condensing surface, such as a piece of cold iron, over the calcining mass; if the saturation is being effected, the surface soon becomes damp. The saturation is continued until there are neither antimonial nor arsenical fumes, nor the smell of sulphurous acid or sulphureted hydrogen. The process is then completed, and the charge is drawn; it is ready for any further treatment for extracting the precious metal. A peculiar condenser for facilitating the solidification of the metallic vapors given off in these evasting processes has been perfected by the introduction of the process described.

A New Rock Breaker.

George H. Malter, of the well-known firm of quartz mill builders of this city, has received, through the MINING AND SCIENTIFIC PRESS Patent Agency, a patent on a rock breaker which has several new features. The machine has the ordinary frame, with one fixed and one movable jaw, each being provided with suitable dies or crushing faces. The lower jaw has its lower end fitted to turn upon a shaft which extends across the frame, and the upper end of the jaw is oscillated by a crank, cam or eccentric.

Mr. Malter shows two constructions for compensating for wear. In one an eccentric shaft is used, and in the other a straight shaft with eccentric journals. By the first construction, in order to adjust the lower end of the jaw toward the fixed one, to compensate for the wear of the dies, the shaft has its central portion turned eccentric to the ends, which are supported in boxes upon the frame. The lower end of the jaw is fitted to the central portion of the shaft, so that the latter may be turned around it. It will be manifest that when the shaft is turned the eccentric portion will cause the lower part of the jaw to advance or recede as desired. In order to produce this movement the inventor employs a lever or other suitable mechanism connected with the shaft. One end of this lever is rigidly fixed to the shaft, while the other extends upward far enough to give the necessary power to turn the shaft, and it is arranged so as to be held at any desired position. Gibs are fitted to the journals of the shaft, and made tight by keys. When the shaft is to be turned around, these gibs and keys are loosened, and the lever moved to advance the jaw to the desired point of adjustment. The keys and gibs are again tightened, and the shaft and jaw will be held firmly in its new adjustment. In this manner the jaws may be kept at the desired distance apart, and the wear of the dies compensated until they are worn so thin that they must be renewed.

In order to produce a surface which will wear less rapidly than ordinary dies, Mr. Malter forms dies of cast-steel having parallel slots made transversely on them at short distances apart, and extending nearly, or quite, from side to side of the dies. Within these slots are fitted steel bars made harder than the metal of the die; and this surface will resist abrasion, which the unequal wear of the dies and bars will produce, transverse ridges which will keep the rock from jumping out of the jaws while being crushed, which is an advantage.

In order to prevent the breakage of important parts under excessive pressure, the cap, which is holted to the upper part of the movable jaw, against which the arm from the operating eccentric presses, is made hollow, and a block of rubber is placed within it. If any unusual pressure takes place, the socket upon which the pressure is exerted gives way, and the pressure is thus absorbed by the elastic rubber block beneath, and is not communicated to the jaws. The machine may then be stopped without further injury, the impediment removed, and a new cap substituted. Other forms of breaking-pieces may be used, but this is very suitable.

An Important Patent Decision.

Judge Sahin, United States District Judge for the State of Nevada, has rendered from the bench of the United States Circuit Court in this city, a decision of much interest in the case of the Salamander Felting Company vs. Benjamin S. Hill and William Gould. The suit was brought to restrain defendants from alleged infringements of certain patents which are for a plastic compound material for covering heated surfaces to prevent radiation. These patents, three in number, have been in litigation in Massachusetts, New York and Missouri, where the Federal Courts have sustained them. In the suit in this city, the defendants denied that they had infringed the patents. They became partners in business in September 1882, and about one month later this suit was brought against them. Gould, prior to their partnership, had been in the business of covering boilers and heated surfaces with a plastic non-conducting material. Judge Sahin declares that the case of the Salamander Company, so far as it was in anywise made out, was supported mainly by the testimony of their agent, Millard, Thomas Price and D. W. Johnson. Millard's personal knowledge of the materials used by Hill & Gould, was derived from samples not identified, and certainly shown not to have been made or applied by them. His analysis based on sight and taste, has little value. The testimony of Prof. Price and Prof. Johnston is quite material, and the Judge gives it full consideration. Prof. Price, for example, submitted twelve assays made by him of material given him by the Salamander Company, and presumably made and used by Hill & Gould. The Judge says he finds but two of these assays were of materials shown to have been made or used by Hill & Gould. Of the materials from which the twelfth assay was made, Millard says he saw the defendants applying it. Hill denies this, and so it stands, at least not proven. Prof. Johnston submits nine assays. These may be criticised like those of Price, as they were made from the same samples. Gould, before his partnership with Hill, may have made and used the materials from which all the other assays were made, but this suit is not against Gould; it is against the partnership of Gould & Hill. "If we consider," says Judge Sahin, "all of the twelve assays of Prof. Price, and hold the defendants responsible for the use of the materials, it will still be very doubtful if they have in any manner infringed upon the patents. * * * I cannot think the bill is in any degree supported by the evidence. * * * The testimony of the defendants is full and frank, and the defense is sustained. * * * It is probably true that as non-conductors of heat the one of these appliances may be equivalent to the other, but beyond this there seems to be little similarity between the two substances.

"But were the clay used by the defendants an equivalent in part or in whole for the lime-putty used by complainants, still I do not think the use of the clay would be an infringement. This clay is a natural product. In its use I do not think the defendants added lime in any form. It is not obvious why one may not use a natural product which he finds suitable to his wants and purpose, even though another has a patent for an artificial substance which may answer the same purpose and possibly be a better article. It would seem that the laboratory of nature was for the benefit of all. * * * In this case I do not, from the evidence, think that the defendants have, directly or indirectly, been guilty of any infringement upon any of complainants' patents, and the bill must be dismissed, with costs, and it is so ordered."

Messrs. J. L. Boone and J. J. Scrivner were attorneys for the Salamander Felting Company, and Messrs. John A. Wright and T. E. K. Cormac for Gould & Hill.

MR. CHARLES M. ROLKER'S report on the property of the Colorado Coal and Iron Company, gives the comparative cost of the various processes in Colorado and Pennsylvania as follows:

	Penn.	Col.
To produce a ton of pig iron.....	$19 43	$20 19
To convert pig iron into ingots.....	29 26	33 40
To make steel blooms.....	31 93	38 57
To make steel rails.....	36 41	46 63

The Garland Sewer Trap.

People who live in the city have no more deadly enemy than sewer gas, which steals as silently as death into every house that has a kitchen sink or water closet connection with the street sewer system of the city. If stationary wash basins are found in every room, then every room is in danger of foul and death-dealing, vitiated air, unless fortified by some more than ordinary device for resisting the entrance of obnoxious gases from the sewers.

Notwithstanding the fact that all the waste pipes in the residence of the writer are entirely disconnected from the sewer systems, by discharging into an open hopper outside of the house, it was found that an offensive odor was constantly invading the upper-story rooms. The waste pipes were provided with traps just beneath the wash-basins in the chambers, and traps below near the ground, yet the obnoxious atmosphere prevailed in the chambers.

It was found that the water in the upper traps were invariably siphoned off when the basins were emptied through the waste pipe. This allowed all the foul air arising from the connecting lead pipe, and the adhering waste matter accumulating between the basins and the traps near the ground, to unite in vitiating the atmosphere of the chambers.

A trap, called the "Garland," was applied beneath the wash basins, and found to be efficacious as against siphoning, and effectually prevented all odor from arising from the pipes. An engraving of this Garland trap is given on this page. It is quite simple, as the cut shows, yet is so arranged as to perform its functions automatically and with perfect success. It has a loaded hollow glass ball valve, slightly heavier than water, and two and one-half inches of water trappage. The traps are made of lead, of uniform thickness, and perfectly smooth inside and out.

In the engraving one of these Garland traps is shown applied to a stationary wash-basin. The basin A has the usual overflow pipe B, and basin discharge pipe C. This discharge pipe C is connected with the traps directly as shown. The portion of the water in the trap is shown by the shaded lines in the engraving. F is the loaded glass-ball valve forming a water-tight seal. The outlet E connects with the main water-pipe. H is the trap-screw which is easily removed to recover anything of value lost through the basin sink or other fixture.

When the basin is to be emptied the plug in the bottom is drawn out and the water passes down the pipe C, lifts the ball-valve F and passes out of the water pipe E. When this is done and the flow has ceased the ball valve F drops to its seat again. A portion of the water represented by D remains above the valve F and the portion represented by G remains below the valve.

When the valve F is in its seat, in case any sewer gas should rise through the water pipe E from the sewers, it only forces the valve F more firmly in its seat and cannot pass downward into the water G and up the pipe C into the room. As soon as the outward flow of water ceases, the ball-valve falls gently into its seat again, making it is said a perfect seal against sewer gas. This valve being just heavy enough to sink, acts as no obstacle to the outward flow of anything.

A severe test was made of this trap in the Arcade House. A trap was put in on the fourth story of the building, and connected with pipes in which there were no vents, but it was found on discharging the basin that there was over an inch and a half of water left in the outer chamber of the trap, showing slight siphonage. Then the trap screw was removed, but the valve held the water in place.

Many people suppose that the vent pipes to traps are effective to prevent sewer gas entering, but it must be remembered that with these evaporation of the water in the traps is hastened, and the traps often become empty. Under certain conditions, when these traps are thus emptied, when the room is warmer than the outside atmosphere, the sewer gas will come into the room instead of going out of the vent pipe.

This trap has been on the market for some four years, and people are beginning to recognize its merits, as it has stood the test of experience and time, and the inventor has very numerous recommendations from people who use it. Leading authorities pronounce the trap one of the most important inventions in the plumbing line for many years. There is nothing perishable in any part. It is in use in most of the fine buildings in this city and Oakland, and is recommended by the Board of Health, architects, and the trade generally. From the experience of the writer, the claim of the inventor that the trap is a good preventive of sewer gas is verified. Parties interested in sewer traps should certainly give the Garland trap careful attention.

Charcoal as a Precipitant for Gold.

Some time since we mentioned briefly the fact that Mr. W. Morris Davis had discovered a novel and interesting method of separating gold from its solution by employing charcoal. He found that charcoal has a remarkable energy in causing the precipitation of gold from its chlorine solution, while other metallic and mineral constituents of the same solution are unaffected. The gold is thus both deposited and refined. All that is necessary is to pass the solution of the gold through a charcoal filter, when the gold, in a pure state, is deposited upon the charcoal, which may then be burned and a button of gold readily obtained.

THE GARLAND SEWER TRAP.

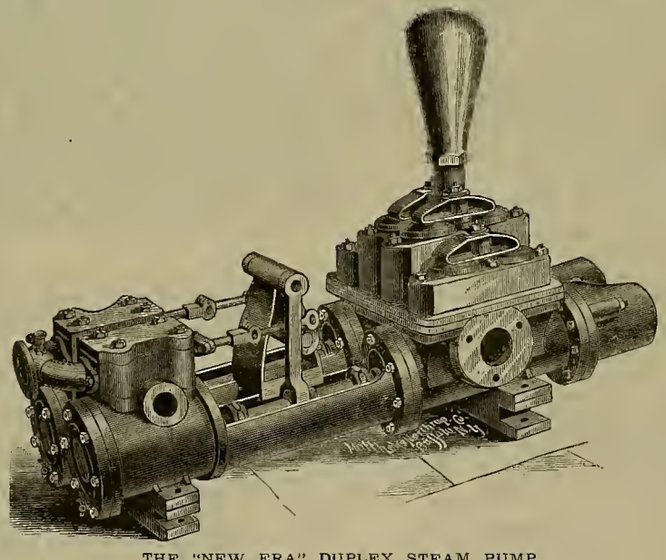
The discovery, so simple in its method, was at first ridiculed by chemists. Repeated experiments have, it is stated, shown its efficacy. Not only are no other substances than gold thus deposited, but the gold itself is stated to be completely separated from its terchloride solution, the liquid, after having passed through the charcoal, containing not even a trace of gold.

As copper is not affected by the passage through the charcoal filter, that metal may be afterwards deposited by contact with scrap iron. Silver would already have been precipitated as chloride in the original solution. By this process, therefore, gold, silver and copper may each be separated by most inexpensive methods from the same solution.

The explanation of the remarkable property of charcoal here described lies in the fact that, as shown by experiment, it has the property of converting chlorine into hydrochloric acid. It oxidizes at the expense of the water, and liberates hydrogen, which unites with the chlorine. It follows, therefore, that the gold is deposited, not from any affinity for carbon, but simply because the chlorine in which it was soluble has been taken away to form hydrochloric acid, in which gold is insoluble. It also follows that copper and other metals soluble in hydrochloric acid are not affected by the conversion.

Another Gold Excitement.

The latest gold excitement is directed toward a point in the Little Rocky mountains about 100 miles east of Benton, Montana. The mines are placer diggings. A number of parties have been organized at Benton to go to the new diggings, and many miners have also gone from Fort Assiniboine, Rock Point and Maiden. From Benton the trip can be made overland, or down the river in mackinaws, the gulch being but a few miles from the river. Gold from the reported mines has been sold at Maiden and Fort Assiniboine, and it was taken out in a few days without sluice-boxes or any facilities for washing. It is claimed that the mines will pay seventy-five dollars a day to the man when properly worked. The discovery gulch is five miles in extent. It is said that the existence of gold in this region has long been known to old Montana miners, and the reported rich finds receives general credence in that territory.



THE "NEW ERA" DUPLEX STEAM PUMP.

A dispatch from Helena, (M. T.) dated the 9th says: "There is great excitement prevailing at Benton over the confirmation of an important gold discovery in the Little Rocky mountains. When the discovery was first reported the citizens of Benton sent a committee, consisting of P. H. Aspling and Dennis Helpin, to investigate. They telegraphed to-day that the mines were good. About 100 claims have been taken up, and those worked pay from $6 to $10 per day to a man working with an ordinary gold pan. In one instance $300 was taken from a pit twenty feet square. Jerry Collins, editor of the Benton River *Press*, telegraphs that half the citizens of that town are either preparing to join the stampede or have already gone.

It is officially announced that cholera has appeared at Bordeaux.

The "New Era" Duplex Pump.

An engraving on this page represents the "New Era" Duplex steam pump. The peculiar valve motion is the prominent and important peculiarity of this pump, as being that to which it owes its complete exemption from noise or concussive action. Two pumps are placed side by side, and so combined as to act reciprocally upon the steam valves of each other. The one piston acts to give steam to the other, after which it finishes its own stroke, and waits for its valve to be acted upon before it can renew its motion. This pause allows all the water valves to seat quietly, and removes everything like harshness of motion. As one or the other of the steam valves must be always open, there can be no dead point. The pump is always ready to start when steam is admitted, and is managed by the simple opening and shutting of the throttle valve.

The peculiar motion of the Duplex allows it to retain a very high rate of speed without noise or hurtful concussion. In single cylinder steam pumps the valve is thrown open at the end of the stroke by a blow upon a tappet, or direct upon the valve. This blow becomes more violent as the speed increases. Their water valves are also dangerously concussive at a high speed, being slammed to their seats by the sudden retreat of the plunger. To make the action of the machine less harsh, the length of the stroke is increased, thus decreasing the number of blows. With the valve motion of the Duplex pump these difficulties are avoided. It has no tappets. It neither strikes a blow nor operates suddenly on the plunger. The piston cushions quietly on steam at the end of the stroke, pauses for an instant until the water valves have closed, and then starts on the return stroke gradually, as the steam valve is opened by the motion of the opposite piston.

The tables arranged by the manufacturers for the purpose of readily comparing the capacity of the Duplex with that of any other single cylinder steam pump, show that the Duplex, being in fact two double-acting pumps, working side by side, has double the capacity of any single cylinder pump of the same diameter of plunger; and that any single cylinder pump must have a plunger twice the area of one of the plungers of the Duplex, in order to equal it in capacity. One of Felthousen's patent oil pumps is sent with each Duplex pump. All pieces are made to gauge and can be readily renewed. Cavanaugh & Fredricks, 317 Mission street., in this city, are managers for the Pacific coast.

AMERICAN MANUFACTURES.—It appears from statistics recently compiled that the whole product of American manufactures in 1850 was valued at $1,019,000,000; in 1860 it was $1,885,000,000; in 1870 it was $4,232,000,000, and in 1880 it was $5,369,000,000. An explanation of the enormous increase in the volume of trade is found partly in the increase of the producing population, but chiefly in the multiplication of machinery. In 1850 there were altogether 957,000 hands employed in manufacture: in 1860 the number was 1,311,000; in 1870, 2,053,000, and in 1880, 2,700,000. The increase from 1850 to 1860 was thus 37 per cent, from 1860 to 1870 about 50 per cent, and from 1870 to 1880 about 31 per cent. The *London Times*, in referring to this enormous increase says: The productive capacity of the United States proceeds at a far greater rate than that of any other country. Half a million persons are added to the population every year from immigration, and these represent a productive element. All are workers, and, indeed, there are few idlers in the States altogether. Another important point is that the machinery represents a producing element exclusively. The great need is to find additional consumers of the products of the enormous industries going forward. The home market has hitherto been chiefly the concern of the manufacturers, but now this market is completely overstocked, and it is necessary to find out foreign buyers. If these be not provided, and the productive capacity of the United States goes on increasing at the present rate, the American people will have labor problems thrown on their hands, which they will find it very difficult to solve.

In the case of the Sutro Tunnel Company vs. The Seg. Belcher, Judge Rising, Saturday, at Virginia City awarded plaintiff $11,920, with 10 per cent interest from February 10, 1882.

The Swinging Axe.

One of the most potent factors in civilization and progress is the "swinging axe." It has ever moved in the van of empire on its westward march. Its great and chief field of labor and progress has been on this continent. The "American axe" is quite distinct and superior as a tool from that implement as found anywhere else on the globe. In fact the American axe is fast supplanting every other make. If an English statesman wishes to show his prowess as an axe-man in felling a tree, he selects an American axe for his implement. It is a very ancient instrument. In studying up the derivation of the word one has to go far back into the pages of the most ancient written languages. It is probably one of the earliest tools invented; but until it found its way into American forests it remained a very clumsy instrument. As now manufactured in this country it has probably attained as near perfection as human ingenuity can reach in the form and constitution of steel and in the mathematical accuracy so important in the shaping and peculiar curving of its handle.

It has been truly said that there is no cleaner, healthier or eujoyable exercise than swinging an axe. In handling one nearly every muscle of the body is brought into active play. It is a whole gymnasium in itself. It will chop out a torpid liver or a dyspeptic stomach far sooner and more effectually than such troubles can be removed by drugs, either olopathic or homeopathic, and it will establish an appetite and digestion which would do credit to a wolf or an ostrich. Perhaps one of its chief advantages arises from the choice it makes of its field of exercise. It must be brought into play where there is plenty of room and good fresh air; and as a healthy body generates a healthy and well balanced brain, so the axe is an indirect promoter of mental and moral vigor.

The workshop of the axe is wide and spacious. It reaches from ocean to ocean and from the gulf to the lakes. Its echoes resound through every mountain valley and are heard from every hill-top. The chopper needs no fire to keep him warm; but his axe often refuses to do duty, when it has been subjected to the influence of a heavy frost until "thawed out" in the presence of a friendly fire.

After leaving the pineries the axe has a long ramble to a new life upon the Pacific slope. In California, on the Coast Range, it enters the famous redwoods, and then indeed another existence is found. In fact, its position in society is elevated. Those noble trees, the Goliaths of the forests, are fast disappearing. But their gigantic stumps still remain to tell of their departed greatness. And enormous stumps they truly are. So much so, indeed, that the axe has to climb in the world to overcome them, and the chopper assumes a position which he is not compelled to take anywhere else. To surmount the enormous swell at the base of the tree and and commence operations where the average diameter of the trunk may be said to begin, he builds a platform made of stakes with cross-pieces of rail, sometimes six or ten feet high, around his victim, and chops from that cutting above the bulbous swell. Or, if an expert, he will simply "bucket" a hole in the trunk, and, driving a stout stake into it, stands perched upon that sleuder foothold as he dextrously swings his blade.

The size of the redwood giants is world-famous and it is a legend of the coast that a woodman having chopped for a week on one side of a tree walked around it and found another chopper who had been at work for a month on the other side. Huge they are but beautiful wood to chop, fairly luring the inquisitive blade to the mysteries of untold centuries wrapped up in their red hearts, and the death-bellow of the forest colossus as, in his final agony, he plunges down some dark wooded canyon, crushing all before him, may be heard reverberating in dull thunder through the cloaked hills at all seasons of the year.

Of the axe in the oaklands of the southwest where it labors for France and Spain, sending them annually thousands of dollars' worth of staves, and also of its desultory existence in cordwood chopping, "grubbing," charcoal stacking, hoop-pole cutting, and kindred industries, little need be said, save that it does its share of the work honestly and has a settled policy that no man shall hold intercourse with it with his coat on. This deference it exacts from all with whom it enters into business relations, whether among the ice-locked lakes and rivers of the white pine, the laurel-scented canyons of the Coast Range, or the magnolia-haunted lagoons of the mournful, moss-draped cypress. There is hardly another physical labor affording the independence of the axe-man. In timbered lands he is always in demand. In the woods there is always room for good choppers, and an axe-man need never be idle from September to April.

A RICH FIND.—Douglas county is excited over a rich find recently made in Red canyon. A prospector brought in a sack of ore to Genoa last Thursday, which contained the richest specimens ever seen in Nevada. Free gold was visible with the naked eye, and it was estimated that the sack of ore would realize $1,000. People are flocking to the canyon and making locations.—*Inyo Independent.*

Saving Flour Gold at Snake River.

The Bellevue *Chronicle* says: The decrease in the depth of Snake river, and in the number of rain-storms along its banks, have given placer miners a chance to get to work, in some cases with remarkably large results, says the Shoshone *Journal*, while from all the districts increased activity as compared with last year is reported. At Bonanza bar the Holyoke Company is about finishing up the bar tbey have worked for the last few years. This compauy is also operating the Shoshone har, and, further down, the Castle Creek, and have been paying a monthly dividend of 3 per cent on a capital of $150,000. The Boston company is making preparations for the biggest run of the season. Clark's concentrator, for saving the black sand, instead of returning it to its native Snake, is not quite finished yet, but great results are expected from its operations elsewhere. The Midas Company has two steam mills on its claims. The upper one started in on the 7th inst. on a small 8-inch centrifugal pump, which supplies the ground sluice with about 100 inches of water, and after a few hours run reported 2,000 pounds of sand on the burlaps, worth from $25 to $30, estimated from the rate per ton which this dirt carries, as ascertained from previous workings of the bar. The Hamburg unexpectedly struck three springs of water flowing from the lava rock, forming the walls of the canyon. This pleasant surprise is being utilized hy digging a ditch which will unite the three into one, giving togctber about twenty inches of water, and relieving the company from the necessity of pumping water from the river, as was its first intention. The ditching and the building of the mining machinery will be completed about the 20th of August, when the work of saving the gold will be inaugurated, under the superintendence of Mr. James Gifford. A small run lasting about two hours, with two men, on an experimental machine, and using the water from one of the springs, resulted in a "dab" of amalgam weighing six ounces—a pretty fair augury for the pecuniary success of the enterprise. The Idaho Placer and Improvement Company, Judge L. K. Adams, manager, has one of Job Smith's water motors in successful operation on the Excelsior claims, and although the water has been so far applied to irrigating purposes, the applicability of the machine to raising water to any desired hight for mining purposes gives the motor a place in a mining article. The bar of the Excelsior is not above the average, but is expected to yield from $5 to $7 per ton of concentrates, when the sluice hoxes are finished and the amalgamated plates put in position. It is at this point that the Vulcan company runs a ferry in connection with its mining plant. Water is to be furnished through a centrifugal pump run by steam power, but operations have not begun there yet.

Lead Works in Utah.

A visit to Franklyn is interesting because of the busy scene one is urshered into. The Horn Silver, with its 170 men, is handling about 140 tons of ore per day and turning out about four car-loads of bullion, which aggregates $12,000 every 24 hours. This great property is so well known to our readers that it is needlses to enter into any description of tbe works. Connected as it is with the railway by various sidetracks, ore, fluxes and fuel are handled with as little manual labor as possible, and yet we find this small army of men always busy, and with plenty of work to do. The dump pile is being raised some three or four feet, thus giving a very large dumpage on top of the old slag pile.

The Germania.

At the Germania we found only one furnace at work, the other two heing idle for repairs. Eighty or ninety men are employed about the works when in full operatiou. At present fifty tons of ore are reduced per day. At the time of our visit they were eugaged on Crescent ore, and mixing in roasted ore and ore from the Juab Lawrence mine in Little Cottonwood. The refinery part of the works was also closed for repairs, but bullion was being hauled, ready for refining when the furnaces are heated up again in a day or two. An immense pile of refined lead is piled up ready for shipment, but the company is not anxious to dispose of this until there is a rise in the market. The white lead works were in full hlast with most of the machinery. The product of white lead per day is about 10,000 pounds. This is put up in various shapes, such as dry paint, and mixed in oil, then packed in kegs of 12½, 25, 50 and 100 pounds each. The company manufacture their own pyroligneus acid for oxidizing the lead, after it has been made into minute granules by the action of steam jets while in a molten condition. Red lead and litharge are also manufactured, this part of the business being conducted in a separate building, having a capacity of 6,000 pounds per day, making the entire consumption of refined lead average about 16,000 pounds per day. The works employ forty men, and everything appears to be in first-class order. There is, also, an excellent pipe-plant, capable of turning out a car-load of lead pipe in a day, and this is run often enough to supply the demands, which are all the time on the increase.

This lead industry promises to become a very important one for this locality, and we hope its success will lead to the establishment in this valley of many new manufacturing enterprises.—*Salt Lake Tribune.*

Tailings Worked Profitably.

It is generally conceded that by the most improved milling machinery now in use for the treatment of gold ores, at least from 25 to 30 per cent of the gold is lost in the tailings. The idea that the principal loss is involved in the escape of a large percentage of sulphurets is incorrect. As a matter of fact the sulphuret-saving machinery works closer than the machinery for catching the free gold. It has been ascertained that the chief loss is in the exceedingly fine particles of gold—so light on account of their exceeding fineness that they escape amalgamation by either floating on top of the agitated water or else become mixed with the slime from which it has been found impossible to separate them. While at Amador City the other day, our attention was drawn to some extensive carpenter work in process of construction below the Keystone mill. On inquiry, we learned that the works intended to catch the free gold contained in the tailings by a process never before tried on this coast. The method is patented by Messrs. Morris and Clements, who were personally superintending the constructions of the works of the Keystone. Whilst the plan is new to this country, it has, we are informed, been practically tested for years in South American mines with gratifying results. There it has passed beyond the experimental stage, and has taken its place as an ackuowledged gold-saving contrivance. The tailings are first run into a large tank. Below this is a large hoarded surface, having a slight fall. Slats are nailed over this at a distance of about a foot apart, thereby forming twenty shallow sluice-boxes. Over these strips of of blankets are laid, covering the entire surface. The tailings are then run over these blankets, and, covering such an extended area the stream is necessarily very thin and the current slow. The idea is that gold-freighted slime adheres to the blankets, while the lighter and worthless material runs off. A man is kept steadily at work washing these strips of blankets in a tank of water kept for that purpose, going through the entire lot every hour or so. In this way a considerable percentage of the fine gold contained in the slime is concentrated in the tank. By what process the gold is afterward separated from the slime, we are not permitted to state. This is probably the great secret of the husiness. The process seems feasible enough. We understand that the inventors are under engagement to put up similar works at the Plymouth mines as soon as they get through at tbe Keystone. The plan is reported a success in other countries, and the presumption is that it will prove so here.—*Amador Ledger.*

DEMORALIZED SALT WORKS, ETC.—D. B. Lyman, Superintendent of the Sierra Nevada and Utah mines, has just returned from a trip of inspection to the Eagle Salt Works, out on the line of the Central Pacific, toward White Plains. The Eagle Salt Works are now owned by the bonanza firm. Mr. Lymau says it has been a bad season for making salt. Before the heavy rains set in there was in the evaporating reservoirs a stratum of good salt, amounting to several hundred tons. The rains deposited upon this a stratum of sand and upon this was deposited another stratum of salt, and so on—a stratum of sand marking the wet and a stratum of salt the dry weather. It is a very pretty stratification, but the trouble is that the salt cannot he separated from the sand without re-dissolving the former. Mr. Lyman reports the White Plains artesian well down over 2,100 feet, with hard rock at the bottom. He brought in some curiosities in the shape of geodes, picked up out on the desert. One of these, about the size of a black walnut, is a perfect imitation of a death's-head. There are black cavities representing the eyes and the nose, while the remainder is of a dirty white color.—*Virginia Enterprise.*

RECEIPTS OF COAL IN AUGUST.—The receipts of coal at San Francisco last month were larger than for any previous month this year, and the total was nearly 18,000 tons in excess of July. The quantity was proportionately distributed among the several sources of supply. Exclusive of the product of the Mount Diablo mines, the deliveries for August and for the first eight months of the year have been as follows:

	For August.	Jan. 1 to Aug. 31.
Carbon Hill	16,890	101,015
Renton	2,066	28,202
Seattle	15,345	87,459
Coos Bay	1,800	16,109
Anthracite	1,458	9,805
Cumberland	3,000	15,907
East Wellington	1,600	10,403
Nanaimo	9,796	64,244
Wellington	7,030	73,686
Australian	12,688	74,574
English	6,823	35,853
Welsh	2,401	12,814
Scotch	2,375	11,356
Totals	83,272	540,927

Gold and Silver in San Francisco.

In the vaults of the sub-treasury in this city there are eighty-three millions of dollars. Assistant Treasurer Nathan W. Spaulding, who controls the sub-treasury here, has occupied that position for three years, during which time the amount in the treasury has iucreased from about $27,000,000 to some $83,000,000. Mr. Whelpley, Cashier of the Treasury Department at Washington, and Mr. Smith arrived on the 26th of July, and at once began counting the money in the vaults and making a thorough inspection of the books. Thirteen assistants, engaged in this city, were employed, and the inspection was concluded on the 28th ult. The inspectors remarked that the sub-treasury in San Francisco was the second in magnitude and importance in the United States, and complimented Mr. Spaulding highly on the methods and business of the office. They had failed to find a discrepancy of one cent in $83,000,000! The books of the office were also found in admirable order.

Very little of the working of the United States Treasury is known to the general public, although the office is run to accommodate the people, and the daily exchange in money averages some $20,000. Of the amount of money in the treasury, not counting decimals, $51,500,000 is in gold, which weighs 85¾ tons; $26,000,000 in silver, which weighs 715 tons, and $5,000,000, in round numbers, in paper. It would appear at first sight that thirteen people would take much longer than a month to count this immense sum of money, but it is counted by weight. The gold is all kept in sacks of $20,000, and the silver in sacks of $1,000. These can be quickly weighed and thus the amount in the treasury easily determined.

All the business for the federal government west of the Rocky mountains, from Alaska to Mexico, is transacted through the office in San Francisco. The money taken in and paid out amounts to over $6,000,000 a month. This comes from or goes to the Custom House, Internal Revenue Department, Post-office, Laud Office, etc. Money is paid out to all the federal offices, courts, army and navy, Indian agents, government contracts, mail carrying, coustruction, etc. Great stress has sometimes heen laid upon the fact that so large an amouut of money is allowed to lie idle. Not much does so, as by far the greater part is in circulation through gold and silver certificates.

Concentrating Ore in Utah.

The Salt Lake *Tribune* says: The Crescent Company sent in 3 lots of ore, valued at $10,450. The concentrating mill at the Crescent, planned in its methods and machinery by Mr. B. B. Van Deusen, will embody all that has been recently learned respecting the concentration of lead ore. Rolls will be used for crushing, thus avoiding pulverizing the lead more than is necessary, which makes a slum of it, exceedingly difficult to handle. The secret, Mr. Van Deusen says, lies in sizing. The ore will be delivered automatically into revolving sizing screens, set one below the other, five or six of them, the different sizes save the slums going then to jigs. The slums will go to Ritteuger tables or similar tables; and it is believed that 90 per cent of the lead can in this way be saved. The loss in silver will depend on the amount of silver in the quartz, which will all be dressed out, and in the form of chloride. Mr. Van Deusen does not approve of stamps for carbonate ores, because, as said before, it transforms the lead into a slum, which is the worst condition to put it in for concentrating. But for lead ores mixed with iron pyrites, the stamps, as at the Spanish mine, may work well. Austin Bemis and his associates, at the Spanish mine, succeed in dressing out the pyrites of iron, as when broken to the same size as the galena the two separate readily, by reason of their different gravity. This mill (5 stamps) has been used more or less for some years, but the improvements in the art have only been added lately. It will soon start up for business, and is expected to successfully dress the pyrites lead ores of Bingham. By all accounts Mr. Michener's mill (the old Great Basin of Gen. Conner) at Stockton has got the trick of concentrating low-grade lead ores to perfection, and all the implements to do it with. The ore bodies are said to be stronger than ever in the lowest openings of the mine. Mr. Michener might earn dividends with this property, but the low price of lead is inducing him to hold back shipments. The failure of lead to re-act these days is the dark spot in the sky of Utah lead silver mines.

THE Tombstone Mill & Mining Company has mined and treated during its existence $9,608.39 tons of ore, yielding an average of 35,991 ounces silver, and 0.105 ounce of gold per ton. Mining last year cost $14.31 per ton; milling, $5.62; concentrating, $1.57; smelting, $18.90; sundries and administration, $1.77. The ore product last year was 17,520 tons. The mines have produced bullion in two years valued at $1,375,237.26, yet its bonded debt is only $106,000 less than it was when dividends ceased. The compauy joined the movement to reduce wages from $4 to $3 a day, and are now idle on account of the deadlock this brought about.

Assessment Work.

"The Law about Annual Labor on Claims."

Great misunderstanding prevails respecting the law of annual labor and of relocation lodes. Hon. Thomas B. Bryan, a prominent attorney of Chicago, says in the *Mining Review* that although section 2324 of the United States Statutes requires at least $100 worth of work to be done on each lode within each year after that of the original discovery, and until the lode is patented, or what is equivalent, a Receiver's Receipt is issued, the neglect to do that required for any one or more years, unless there is intentional abandonment of the claim does not actually forfeit the title. To work such forfeiture there must not only be neglect, but there must also be a legal relocation, before resumption of work by the owner, the neglect and such valid relocation combined operating to complete the forfeiture. The $100 worth of work must be done entirely within each calender year, between January 1st and January 1st, and if $99 dollars worth of work be done in 1884 and $1 in 1885, the work for 1884 is not complete, nor is that of 1885, until a full $100 of work shall be finished in 1885, a fraction of the $100 of work done in any one year not applying or cutting any figure as to work for any other year. If the owner neglects in whole or in part his annual labor for 1884, or for several years, he still has the first claim to the lode as long as another has not relocated it, for if no one has taken advantage of the claim being open to relocation the owner may resume work on January 1, 1885, or at any time thereafter, in advance of such relocation, and from the moment of such resumption of work in good faith, past neglect is forgiven, and the negligent owner's title is cured of its defect. If, however, a relocator should commence work on January 1, 1885, or at any time thereafter before such resumption of work by the negligent claimant, and should conform strictly to the requirements of the law in regard to relocation, the relocator's title is perfected, and the previous owner's claim is forfeited. The question is often asked, What amount of work must be done by the original owner after neglect of a previous year's work, to entitle him to hold the claim? Must he not only resume work, but also continue it uninterruptedly till the $100 worth of work is completed, or if he should also resume work, and then suspend it, can another party during this suspension, and before the $100 worth of work is completed, enter on the lode and make a valid relocation? A great diversity of opinion has been entertained on this question, the best mining lawyers holding that the resumption in good faith is sufficient, and that it entitles the party so resuming to continue and complete his $100 worth of work during that calendar year up to and including December 31st. The last case of this kind noted in the books was reported November, 1882, in 62 California 160, where a mine owner neglected his annual work for one year, then resumed work the following year, but after doing about $12 of work upon each lode in January suspended work. Another party entered and attempted to relocate in August. The Supreme Court of California decided such relocation to be illegal, and that the original owner could have completed his work any time during that year. "The work done was actual and valuable. The letter of the statute upholds the view as to resumption of work, taken by the Court below, and forfeitures and denouncements are not to be favored by basing them upon language which does not plainly and unmistakably provide for them." The law may, therefore, be considered definitely settled in the direction indicated.

BULLIONVILLE.—The work preparatory to the commencement of working their tailings by the new process is now being pushed ahead by the smelting company. Men are now engaged in removing the concentrating tables from out of the mill building and clearing away everything and making ready for the erection of the new machinery required. The tailings will be roasted prior to leaching. Mr. W. S. Godbe has gone to San Francisco for new pans and such other machinery as shall be required. The company expect to realize a handsome profit, as the tailings are all their own, and the various tests made of the tailings in the East exhibit between $15 and $16 in silver. Work is being pushed so as to have the machinery in place and running as early as possible.—*Piorhe Record.*

C. C. STETEFELDT writes the *Engineering and Mining Journal*, combating the notion that fine crushing is essential for good roasting in a Stetefeldt furnace. He gives the result of some trials by Mr. Russell at the Ontario. With a No. 30 screen on the battery, 20 stamps crushed 34 tons in 24 hours, and Russell's process extracted 96.2 per cent of the silver. With a No. 20 screen, 55 tons were crushed in the same time, and 97 per cent of the silver extracted. With a No. 16 screen, 65 tons were crushed in the same time, and 97.2 of the silver extracted. The ore was roasted with 12½ per cent of salt in a Stetefeldt furnace.

LIVELY TIMES AT MARIETTA.—John Bell, of the Mount Cory mill, will leave to take charge of the mill at Marietta, which will start up on the 1st on ore from the Endowment mine. There are about 700 tons of ore on the dump and a long and successful run is predicted. It is said by those who are in a position to know, that lively times are in store for the old camp.—*Walker Lake Bulletin.*

USEFUL INFORMATION.

Colored Varnishes for Tin.

A German paper gives the following process: Thirty grammes of acetate of copper are ground to a fine powder in a mortar, then spread out in a thin layer on a porcelain plate and left for a few days in a moderately warm place. By this time the water of crystallization and most of the acetic acid will have escaped. The light brown powder that is left is triturated with some oil of turpentine in a mortar and then stirred into 100 grammes of fine fatty copal varnish to 60 R. (16.7° Fahr.). If the acetate of copper was exceedingly fine, the greater part of it will dissolve by a quarter hour's stirring. The varnish is then put in a glass bottle and placed for a few days in a warm place, shaking frequently. The small quantity of acetate of copper that settles can be used in making the next lot.

This varnish is dark green, but when applied to tin it requires four or five coats to get a fine green luster; but two coats are sufficient, if it is heated in a drying closet or on a uniformly heated plate, to produce a great variety of shades of gold. A greenish gold, a yellow or dark yellow gold, then an orange, and finally a reddish brown shade is obtained, according to the time and temperature. The colors are superior in brilliancy to those obtained with the English gold varnish, and have the advantage of permanency in the light. If a good copal varnish is used in making the polychromatic varnish, or lac, the tin can be hammered or pressed.

The production of golden colors depends on the reduction of cupric oxide to cuprous oxide (protoxide to suboxide), which, in small quantity, dissolves in the copal varnish with a golden color. The more the heat the greater the reduction, and hence the darker the color. Success depends on applying it evenly and warming uniformly.

TO RENDER HORN TRANSPARENT.—The imitation of tortoise shell with horn is as follows: Mix up an equal quantity of quick lime and red lead with soap lees; lay it on the horn with a small brush in imitation of the mottle of the tortoise shell; when it is dry, repeat it two or three times, or grind one ounce of litharge and half an ounce of quick lime together with a sufficient quantity of liquid salts of tartar to make it of the consistence of paint. Put it on the horn with a brush in imitation of tortoise shell, and in three or four hours it will have produced the desired effect. It may then be washed off with clean water; if not deep enough, it may be repeated. The original preparation consists in roasting the horn over a fire made of the stalks of furze; when rendered soft it is slit on one side and kept expanded flat between a pair of tongs; it is then placed between iron plates, which are greased. The horns are suffered to remain until they are cooled; they are then soaked in water enough to be pared down to the required thinness with a large knife worked horizontally on a block. Their transparency is thus acquired, and after being immersed in lye, they are polished with whiting and the coal of burnt willow.

HOW TO GREASE A WHEEL.—A well-made wheel will endure constant wear from ten to twenty-five years, if care is taken to use the right kind and proper amount of grease; but if this matter is not attended to, it will be used up in five or six years. Lard should never be used on a wagon, for it will penetrate the hub, and work its way out around the tenons of the spokes, thus spoiling the wheel. Tallow is the best lubricator for wooden axle-trees, and castor oil for iron hubs, but many of the patent axle greases are also excellent, and have the merit of being cheaper and more convenient to handle. Just grease enough should be applied to the spindle of a wagon to give it a slight coating. This is better than more, for the surplus put on will work out at the ends, and be forced by the shoulder-bands and nut-washer into the hub around the outside of the boxes. To oil an iron axle, first wipe the spindle clean, wetting with spirits of turpentine for that purpose, and then apply a few drops of castor oil near the shoulder and end. One teaspoonful is sufficient for the whole.

WELL TANNED LEATHER.—The New Hampshire Pulp and Paper Company, Bristol, N. H., while making excavations for the foundation of some new buildings at a depth of 16 feet, came upon a vat containing thirty-six sides of leather perfectly tanned and in as good state of preservation as though given the ordinary time. The liquor was pure and sparkling. On investigation it was found that a tannery was owned by Gov. Berry and burned on this site about 1832, and by some mischance this vat of hides was neither burned nor recovered. The leather is now being finished at the tannery of E. K. Pray, and when done will undoubtedly be some of the best tanned leather in America.

TO PRESERVE POSTS.—A correspondent of a contemporary says: "I discovered, many years ago, that wood could be made to last longer than iron in the ground, but thought the process so simple that it was not well to make a stir about it. Posts of any wood can be prepared for less than two cents apiece. This is the recipe: Take boiled linseed-oil and stir in pulverized coal to the consistency of paint. Put a coat of this over the timber, and there is not a man that will live to see it rot."

LONDON AND NEW YORK.—Manhattan Island is already like London—"a province covered with houses"—but its population is far more concentrated. While London has but 170,000 persons to the square mile in its most densely-settled districts, New York has 290,000. London has seven inhabitants per house, but New York has twenty-five. In London there is an average of forty-nine people to an acre. In New York there are in certain sections from 300 to to 750 persons to the acre. London with less than 4,000,000 people, covers 75,632 acres; New York, with about one-third of the same population, is confined to 12,570 acres, or one-sixth the area. The English metropolis has 486,236 houses, New York has less than 103,000.

TUNGSTATE OF SODA, according to the *Textile Record*, is about the most serviceable substance yet made use of for rendering fabrics fire-proof. In the most effective process for the accomplishment of this object, the material is dissolved in five times its weight of lukewarm water, and, on the solution being mixed with a very small portion of phosphate of soda, it is then ready to be used for saturating tissues. After being thoroughly steeped in this, the goods are wrung out and dried at a moderate heat, and may then be ironed and treated in the usual manner. They are thus made capable of resisting the action of heat for a long time, and, if ignited, they merely smoulder without bursting into flame.

MINERAL WOOL is used for a packing to deaden the sound between floors in buildings, and, being incombustible, it is now pretty generally used between the floors and ceilings in new houses. Mineral wool is obtained from the slag from blast furnaces, and is produced by throwing a jet of steam against the stream of slag as it flows from the furnace.

BOILED LETTUCE makes a good salad and furnishes an excellent substitute for spinach. It is said to possess soporific properties, and not to contain the quantity of oxalates to be found in spinach, rhubarb, sorrel and some other vegetable products used for salads.

SCRAP FORGINGS, made of best selected material, are better for shafts than the best cast iron, which has its place only where slow-running shafts, without jar, can be used.

Boots and shoes, it is said, may be rendered water-proof by soaking them for several hours in thick soapy water.

GOOD HEALTH.

The Growth of Brain Power.

The question now arises, says a writer in the *Phrenological Journal*, in speaking of the growth of brain power: Where in the series of events is there room for any fresh element to come in? Can any man ever be anything other than what some of his ancestors have been before him? And, if not, how is progress or mental improvement possible? That men have, as a matter of fact, risen from a lower to a higher intellectual position is patent. That some races have out-stripped other races is equally clear. And that some individual men have surpassed their fellows of the same race and time is also obvious. How are we to account for these facts without admitting that new elements do at sundry times creep in by chance, in the false and unphilosophical sense of the word? How can we yet advance unless we admit that exceptional children may be born from time to time with brains of exceptional functional value, wholly uncaused by antecedents in any way?

The answer to this question is really one of the most important in the whole history of mankind. For, on the solution of the apparent paradox thus propounded depend two or three most fundamental questions. It is by this means alone that we can account, first, for the existence of great races like the Greeks or the Jews. It is by this means alone that we can account, secondly, for genius in individuals. And it is by this means alone that we can account, thirdly, for the possibility of general progress in the race. It is surprising, therefore, that the question has so little engaged the attention of evolutionary psychologists at the present day. There are only two conceivable ways in which any increment of brain power can ever have arisen in any individual. The one is the Darwinian way, by "spontaneous variation"—that is to say, by variations due to minute physical circumstances affecting the individual in the germ. The other is the Spencerian way, by functional increment—that is to say, by the effect of increased use and constant exposure to varying circumstances during conscious life. I venture to think that the first way, if we look it clearly in the face, will be seen to be practically unthinkable, and that we have therefore no alternative but to accept the second.

INSANITY IN FRANCE.—One of the most striking features of modern French life is the rapid increase of insanity, the number of cases of which, and especially those induced by alcoholism, is becoming larger each year. In 1882 there were 13,434 admissions into the asylums, of which 10,181 were new cases, the total number under treatment in the year being 58,760, of which 27,000 were men and 31,000 women, showing that females are the most liable to the disease. That they are less influenced by treatment is shown by the fact that the average duration of treatment for men is 276 days, while for women it is 295 days. In France there are 61 public and 42 private asylums, of which 9 are for men only, and 14 for women only, the remainder being for both sexes.

Poisonous Coffee.

Who would have surposed that the coffee berry could be tampered with? Very few persons we opine; but it seems that Dr. Walker of the New York Board of Health has been examining several brands of coffee that have been put through a sort of polishing process to make the coffee look better and therefore more salable. In this process a sack of coffee is placed in a horizontal revolving cylinder, and certain substances added which have the effect of polishing and coloring the berries. Some of these coloring matters are the most violent of poisons. Here is the result of the Doctor's analysis of specimens of Guatemala and Mericalbo coffees: Among the coloring matter used is chromate of lead Prussian blue or perrocyanide of potassium, yellow ochre (in which arsenic is often found), amber, Venetian red, lamp-black, gum-arabic, soapstone and charcoal. About one-sixtieth part of a grain of arsenious acid is found in every cup of coffee made from the colored bean.

Dr. E. F. Bartley, chemist, has also made similar examinations and reports that French chalk, gum-arabic, charcoal from wood, burnt bones, yellow ochre, Venetian reds, chrome orange, celestial blue, indigo, indigo extract and other chemicals were used in the coloring process. The use of chrome orange (sulphate of lead) and celestial blue he recommended be discontinued at once. Prof. Martin agreed that the use of chrome orange and Prussian blue should be discontinued, as they are dangerous to health. The companies were directed to discontinue the use of the poisonous drugs.

A large mill establishment for thus doctoring coffee has been established, where whole cargoes are sent by different importers to be treated. Persons who purchase coffee in the bean should refuse to buy any except it be in its natural state. Nothing of that kind can be done to make the beverage any more pleasant to the taste or more healthy to drink. We are not aware that any such objectionable processes are carried on in San Francisco. Our coffee is imported direct and sold in the original package and not tampered with at all.

POISONOUS FISH.—Fish are sometimes in a condition liable to poison the eater—such the conger eel, mussels, crabs, etc. When any poisonous effects appear from such causes, remove as soon as possible the contents of the stomach and bowels by emetics and castor oil. Ground mustard, mixed with warm water, is about as good and as ready an emetic as can generally be found in the house. Castor oil should also be given at once to move the bowels. Ether with a few drops of laudanum, mixed with sugar and water, may afterwards be taken to advantage.

THE POISON OF SERPENTS.—When a person has been bitten by a poisonous serpent, a ligature or handkerchief should be applied moderately tight about the bite, and a cupping-glass, if obtainable, should be placed over the wound, or any practicable means used to remove the poison from the same. The person should also drink freely of any kind of alcoholic stimulant. A small quantity of ammonia should also be given either in the liquor or otherwise. A physician, if present, would probably, in addition to the above, inject ammonia under the skin.

POISONOUS INSECTS.—In case of stings from scorpions, spiders, wasps, bees, etc., moisten a rag with a solution of carbolic acid, or what is probably better, salycilate of soda, and bind it over the bite or sting until the pain is relieved. A few drops of the acid or salycilate in water may also be given internally. The sting of a bee or wasp which is always left in the wound, may generally be removed by making a strong pressure around it with the barrel of a watch key.

VACCINATION performed once does not act as a preventive of small-pox after a certain length of time has elapsed. An examination of the statistics of this disease shows that of those who had taken it and had been vaccinated in infancy, 90 per cent are over 10 years of age, while only 10 per cent are under 10 years of age. Re-vaccination at intervals, say of 7 years, is the only known effective measure for protection.

FOR THE TOOTHACHE.—The Chicago *Industrial News* gives the followiog, by authority, as an instantaneous cure for toothache: Take a small piece of zinc and a bit of silver (any silver coin will do), place the zinc on one side of the afflicted gum and the silver on the other; by bringing the edges together the small current of electricity generated immediately and painlessly, stops the ache.

ACOUSTIC CANES are a French invention for the benefit of persons afflicted with imperfect hearing.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BUNKER HILL.—Amador *Ledger*, Sept. 6: The Bunker Hill mill has been fitted with boiler and engine, so that hereafter, when the water supply is cut off from any cause, they can run the mill by steam. There is always enough water to be had for the batteries.

THE MEDIAN mine is again in operation. Work was suspended for only one day, owing to the slight misunderstanding among the parties interested. A New York company has secured an interest in the property, and they are bearing the expense of the present work. It is the intention to open up the mine in a thoroughly systematic manner. The shaft will be put down to a considerable depth, and levels opened at every 100 ft. Ten or twelve men constitute the present working force, but it will be largely increased when the point for drifting is reached, as it is intended to sink and drift at the same time.

THE WATER at the Gover has been reduced to the 600-ft level. It is the intention of the present management to explore in the 400-ft level for the ore-body. At this point some very rich rock was extracted, and it is confidently believed that a little drifting will result in the discovery of further pay-ore. The mill was to have been started almost immediately, but it is found that water for that purpose cannot be had until winter.

AT THE SEATON things move along slowly. The new pump put in to control the water, had to be taken out. It worked very unsatisfactorily, and was continually breaking. They are now controlling the water by bailing It is contemplated to start up the Mammoth 10-stamp mill shortly to put through the the rock already out, which will take about two months. After that it is probable that the mill will be torn down and removed to the Lighthouse mine.

Colusa.

COAL.—Colusa *Sun*, Sept. 6: We have seen specimens of coal from the mine being opened by E. S. Ashley, west of Maxwell. The coal is very fine, and we are told that the propects for a large mine are very flattering, indeed. This will be a grand discovery for Colusa county, and for the immediate vicinity, if it does turn out well. This land has all been purchased of the government, and the coal goes with the land. Hence, the owners of the land will have a good thing, and will not be bothered getting title under any mining laws. As Mr. Ashley has been very active in opening the mine, we hope it is on his land, or that he has an understanding with the owner.

Fresno.

COARSE GOLD GULCH.—Fresno *Democrat*, Sept. 5: The mineral belt through Fresno county varies in width, being from 3 to 5 miles wide, and is of different formations. On the west side it is of pure slate, being about 300 ft wide. The next towards the east is a metallic slate and serpentine formation mixed, having some deposits of asbestos. In it there are some indications of copper and some coarse gold. The next is a talc formation, with several large sikes running through it, and three or four gold-bearing ledges in it which carry coarse gold. The main placers in early days were on the gulches which headed against this belt. The gold is of good quality, $19 per ounce, and right coarse. The largest that was ever found was picked up near Coarse Gold gulch, on what is known as Deadwood gulch. It coined $707. The next belt is on Potter Ridge. It is very pure slate—soft, with large ledges of iron rock running through it, which are good indications of rich deposits. If any one can find a cross ledge, or a spur, or where two ledges come in contact, he will strike it rich. It never fails in this kind of formation, and the gold is very pure. The Enterprise mine is on this formation. The company is running in a level from the mill which will tap the ledge 2,000 ft deep. They are running the Burleigh drill, and have five men at work. The Hawkeye mine is in the same belt. It has kept a 5-stamp mill running for a year, part of the time day and night. Being scarce of water, they only run during the day now. They are down on the ledge 200 ft, and it is rich, and the gold is free yet at that depth and in soft formation in the bottom. The same company, Messrs. Long & McLaren, discovered a ledge about 400 yards south of their mill about six weeks ago. They have got out about 200 tons of rich ore, and are down 40 ft. The ledge is 3 ft wide, and the prospects now are favorable for a splendid mine. This new discovery is in the Deadwood gulch. John Haley is putting up a mill on the Gambetta mine. They have there about 800 tons of very rich ore. The McDonald mine is running along very steadily. They have a 5-stamp mill. The Texas Flat is running, and has been all summer. They also have a 5-stamp mill. The Last Chance is delayed part of the time on account of not having water enough to run the mill, which is a 10-stamp. The Quartz Mountain is on a boom. They have about 100 white men, miners and carpenters, and a number of Chinamen, at work on their ditch.

Humboldt.

NEW RIVER.—Trinity *Journal*, Sept. 6: From James Mullane, of Big Bar, we learn that latest reports from the quartz discoveries on New River are most encouraging. Smith B. Brooks' partners have prospected the mine he discovered sufficiently to guarantee the success of a mill, and they have gone to San Francisco to order one and get it in as soon as they can. Clifford & Co. have found their rich ledge to be much better defined and larger as they get down on it. Other mines in the district are reported as prosperous.

Inyo.

ETNA FURNACE.—Inyo *Independent*, Sept. 6: A very important addition has been made to the works at the Etna furnace; this is the erection of a refinery, now almost completed. Hitherto the bullion was all shipped to San Francisco, thus adding largely to the expense for freight, and taking away lead that was needed to mix with ore in the furnace. Now the lead will be extracted at home, and will help largely to increase the amount of ore that may be worked. The full capacity of the furnace is 30 tons per day, and it will soon be working that quantity. The company can easily supply the furnace fully from their own mine.

DEEP SPRINGS.—Mr. P. A. Chalfant, who came in a day or two since, from the Greenly mill, Deep Spring district, informs us that the principal object of his visit here now is to procure additional machinery and appliances for saving the gold at the Greenly mill in which he is interested and has been running since it was first started up in June last. Up to the present the mill has been running with no other means of saving the gold than a full set of silvered plates. Not over 60 per cent of the gold can be saved by plates alone, and now, as above intimated, a concentrating machine and other appliances are to be added immediately. The mill has work enough ahead of it to keep it constantly employed for months to come, even from one mine alone, the "78," which in recent developments, shows up grandly, both in quality as well as quantity of its ores. The lead is fully 30 inches thick in most places in two different drifts, never less than 12 inches anywhere, and all pay ore. Three miles below on the same creek, Sam. Piper and Mr. Simonton have just completed and started a fine 12-foot arastra for the reduction of some very rich ore from mines belonging to the first named, situated two or three miles north of arastra, but in Mono county. At Pigeon Springs, Palmetto district, Stevens & Co., are constructing, and will soon have in operation, two 12-foot steam arastras, and it is stated have an abundance of good $40 ore to keep them supplied for an indefinite period. The little silver mill at Lida, still further eastward, belonging to P. Keizer & Co., is making money right along. In Deep Spring valley proper, at Antelope springs, some work is being done all the time toward completeing the McMurry furnace—an enterprise that has the best wishes of every one in that region, for once in successful operation it would "boom" that country wonderfully. S. P. Roberts, at Pine Mountain, some ten miles distant from this furnace, is busy taking out galena ores for shipment to San Francisco. Mr. Roberts is confident he could, from his mines alone, keep this furnace supplied almost if not quite to its capacity taking galena and carbonate ores together. The latter is more abundant than the former, but not rich enough to give any profit to ship to the bay, though quite enough so for local reduction. There are quite a number of other locations in Pine Mountain equally as good perhaps as those being worked by Mr. Roberts, but nothing beyond assessment work is or likely will be done upon them under existing conditions.

Mariposa.

NEW MILL.—Mariposa *Gazette*, Sept. 6: Wm. R. Knight and Daniel Knight, carpenters and millwrights have just completed the 8-stamp quartz mill, run by steam power, on Sweet Water, belonging to James Ferguson and Rice, which is said to be the most complete outfit of a quartz mill ever put up in the country. The mill, which was to have started up last Thursday, lies contiguous to several good veins, either of which contains good ore, and particularly that of the Early vein, which will be worked first.

BANDERITA.—*Herald*, Sept. 5: We are informed that the work of development is still progressing at the Banderita mine, above Coulterville, under the efficient direction of Superintendent Mast, and that gold can be shown every day.

Mono.

THE GREAT SIERRA.—Homer *Mining Index*, Sept. 6: To set at rest the many absurd stories now in circulation regarding the starting of work in the Great Sierra tunnel, Tioga district, we may state that the repairs to the wagon road were completed on Thursday last; that some of the Eastern owners are expected to leave the Atlantic sea-board next week, and to arrive at Bennettville from the 10th to the 15th of September; that they will probably remain there three to five days, and return to their homes about the 1st of October, and then, if things look favorable, they may order work to be started up in October or November. All other statements or stories tending to excite men who are anxious to secure work are utterly absurd and without any foundation in fact.

Nevada.

MINING NOTES.—*Transcript*, Sept. 4: Curnow & Sprye, who recently leased the McCutchan mine, at Canada Hill, have struck a large body of ore that has the appearance of being worth not less than $40 a ton, and are now engaged in taking out a crushing. Mr. McCutchan sold this mine to an eastern company for $10,000, receiving $5,500 of the purchase money. He took out from it the last month before he turned it over to them the sum of $3,200, but the company after operating it awhile, and finding that they could not make it pay its own way from the start, got tired of their bargain, and Mr. McCutchan got the property back for the $4,500 remaining due on it. Mr. McCutchan says he would not sell it again for $10,000 cash. It is doubtless a valuable property. Ore worth $100 a ton is being taken from the bottom of the Charonnat mine. That property has not looked better in a long time than it does now. At the Rising Sun mine in Willow Valley drifting is going on in two directions at the bottom of the shaft which is down 160 or 170 ft. The mine yielded well on the first level, and the indications are that it will improve with depth.

THE FOOTE MINE.—*Herald*, Sept. 6: The Foote mine, situated in the Banner Hill mining district, has a very flattering prospect. A survey was recently made for a tunnel to tap the ledge at the bottom of the shaft and which could not be worked without the erection of heavy machinery. After running the tunnel several hundred ft at a heavy expense the ledge matter was run on to one day last week, and it is thought that in about a week or ten days the main lead will be encountered, and which in the old shaft is first class. This mine is owned by the above-named gentleman and is bonded to San Francisco capitalists. Ere long we expect the mine to be rated as a dividend payer.

THE MARSH MINE.—We saw a fine piece of quartz rock at Gaylord's store to-day. The rock is well charged with sulphurets, ocher, galena, and free gold is also visible to the naked eye. The ore is said by competent judges to be high grade. At the mine, which is in the Canada Hill quartz district, they have a 2-ft lead, which improves in quality as work progresses. A crushing was recently had with encouraging results. The owners no doubt have a good paying property, and in the near future it will be one of our regular dividend payers and a source of revenue to the town.

Plumas.

MINING NOTES.—*National*, Sept. 6: In the Mohawk district the Ward (formerly Teff) mine is being run with a force of 10 men, using all the water available, and showing good results. Mr. Jos. Hapgood has made arrangements to put up a mill on his ledge. The Plumas Eureka Co. are adding new machinery to the Johnstown mill. The Four Hills mine is reported as paying handsomely and regularly. A deposit of gravel, 20 ft or more in depth and prospecting well, has been struck in the Red Slide claim on Poormans creek, owned by Kelly, Turner and others. D. R. Thomas is about through cleaning up. Cap. Donahue has begun two tunnels on the ledges in Hopkins creek, owned by his company. Mining matters around Greenville are reported brighter. McIntyre & Johnson have made a strike in the extension of the Lowery ledge and are milling at the Arcade mill, running its full capacity. Justice Emmons has found the main chimney of the New York mine, about 600 ft above the present tunnel, and is prosecuting work as rapidly as possible. The Green Mountain is running a full force of men. A company is reported as being organized in Greenville to take hold of and work the Southern Eureka. Jim Firmstone & Co. are milling their ore from Dixie canyon in the Crescent mill, using 8 stamps for that purpose. Geo. Cornell will start up the Indian Valley mine as soon as possible, having organized a company for its working. The mine was recently pronounced by an expert to be first class, but to have been badly worked.

San Diego.

MESA GRANDE.—Cor. Calico *Print*, August 6: Since my last the mining interests of this section of the country have loomed up. The Shenandoah mine of Mesa Grande is under the able management of Joseph Cox, the well-known mining superintendent, who has the water all out and the sinking gang at work in good ore. The 170-ft level is looking better than ever and they are getting some good ore from the 120-ft level. On the whole the prospects of this mine were never better. About 30 men are at work in the mine and mill besides a dozen or fifteen outside hands cutting and hauling wood, etc. J. Hoke, an old Calicoite, has had a crushing of ten tons from his Red Hill claim, resulting in about eleven ounces, which is quite good considering that he can take out a ton a day to the hand. As yet he is down only about 30 ft and has done very little drifting. The ledge averages about 16 inches. There is but little prospecting being done on La Mesa, although one or two others have prospects, which time alone will prove whether they will pay or not.

San Bernardino.

BULLION REPORT.—Calico *Print*, Sept. 6: Since our report in last issue of the *Print* the following shipments of bullion were made from mines in Calico mining district through Wells, Fargo & Co.'s express: Three shipments from the Silver King mine, $12,775, and one from the Garfield, $5,287. Total shipments since July 1st, $155,470. This is estimating the bullion at its net value. The gross value would be 17 per cent additional, making the total $181,470.

LAVA BEDS.—Calico *Print*, Sept. 6: J. E. Hawkes, of the Lava Beds, has been in town for a few days. He and his family have been stopping at the well near the mines in that district. He has been industriously at work in a mine in which he is interested. He reports but little work being done in the various mines at present. Most of them are lying entirely idle, while several have only a man or two at work in them. The ore seems to be too deep for a poor man to sink for, and the rich surface deposits are not extensive enough to enable him to make returns that will enable him to proceed to any considerable depth. There is plenty of ore in most of the mines, but it requires capital and machinery to work it with a fair profit.

Sierra.

NUGGET.—*Mt. Messenger*, Sept. 6: McLaughlin, Webber and others took out a 23-ounce piece in the creek below John Fessler's ledge, near Alleghany, the other day. The claim is a bank claim, on Kanaka Creek, and was worked about 30 years ago. In a day and a half thirty ounces were taken out. The Rainbow Company has not yet found the ledge that was worked from the shaft. The quartz tapped by the tunnel appears to be broken up into stringers. After following it some distance they went back, and are pushing the tunnel ahead on its course. About fourteen men are employed. The crushing of rock from Mr. Van Slyke's ledge, in Hog Canyon, resulted very satisfactorily. He is now at work sinking the fifth shaft, and in those sunk he finds the ledge five feet wide, and rich. Each of the shafts is forty feet deep. He contemplates putting up a mill in the spring, in Butcher Ranch, to be run by water, of which there is an abundant and never-failing supply. A sawmill will be erected the first thing. Geo. Davis has purchased the old Snake Bar place, formerly owned by Mr. Parke, and will work it this winter. There is a quantity of good ground there that has never been touched.

WORKS BURNED.—Last week Thursday, the cabin, blacksmith shop and the track sheds of the Blue Gravel mine, above Sierra City, were destroyed by fire. Two men were in the tunnel at the time, sinking a shaft; and did not know of the fire until it was over. Coming out they found the mouth of the tunnel too hot to pass, and made their way to the surface through an air shaft. The loss is about $500, besides the great inconvenience and the stoppage of work. The Company have encountered some very fine looking quartz gravel, well washed; but have not yet got down to bedrock

Trinity.

BULLYCHOOP.—Trinity *Journal*, Sept. 6: Mr. B. S. Guptill, of Indeek, was in town this week and from him we learn that quartz mining in Bullychoop district is active and prospects cheering. Hoskins Bros. have a 3-stamp mill running on ore from the Little Gem which averages about $30 to the ton. The ledge is about 2 ft in width and looks exceedingly well. The Bullychoop Company is taking out large quantities of pay ore and is awaiting the erection of the cannon-ball mill, heretofore mentioned in these columns, to get to crushing and taking out money. Arrangements have been made with Guptill & Maloney to pack 100 tons of ore from the mine to the mill. James A. Grant has struck a new chimney on the Central mine which promises to prove a veritable bonanza. Several tons have been run through a 5-stamp mill and goes from $35 to $40 to the ton. Henry & Davis are running a tunnel on the Pound Cake mine. There are a great many men prospecting in the district with varying success, while a number of others are engaged in doing work on old locations sufficient to hold them for another year. Several of the mines which have been opened are now idle and the men have been put to work on the wagon-road now building from Watson gulch, Shasta county, to the mines. About 40 men are now on the road which it is hoped will be completed this fall.

CLOSED DOWN.—Blakemore's quartz mine in Eastman district has suspended operations so far as taking out rock is concerned, there being now on the dump sufficient ore to keep the arastras running for two years, and it being considered useless to take out more rock at present. The ledge looked well where they quit it, and can be depended upon for an unlimited supply of pay ore whenever more is needed.

Tuolumne.

WET GULCH.—Tuolumne *Independent*, Sept. 6: Our enterprising friend, Mr. D. Levy, is pushing work on his mine, at Wet gulch. He is putting up new hoisting works, pump, etc., to be run by water power, and is constructing and doing everything in the most approved and substantial manner possible and will soon be ready to commence the work of developing his property.

THE OAKLAND mine, above Columbia, is being worked systematically, under the direction and management of practical miners. We understand the company are running their new mill day and night with satisfactory results. The mine is owned by a company of enterprising business men of Oakland and San Francisco.

THE HYDE mine is working again, with a small crew of two or three men in the mine. The mill is also running. Rock from the Pennsylvania mine is being hauled to the Soulsby mill. The ore was taken out some time ago. Crushing rock at the Ohio mine commenced this week. Only two men are employed in the mine. It still continues to look well in the vein.

MILL STARTED.—*Union Democrat*, Sept. 6: W. G. Long and J. M. Hampton have started the mill on their claim near Jacksonville. They have an immense vein or body of low-grade ore which can be mined and milled for a nominal cost. If they are successful in making it profitable they have a fortune in store, as the material in the mine is inexhaustible.

NEVADA.

Washoe District.

SUTRO TUNNEL.—Following is the report of progress and details of work in the Sutro tunnel from August 1st to September 1st, inclusive: Main Tunnel—Removed from along the line of the tunnel, between points 1100 and 3800, 107 posts and 42 caps of old timber. Squared ground, and put in 101 posts and 43 caps of new timber; also lagged and braced sets and cleaned up debris. Re-timbering at the following points being completed, measures as follows: West of point 3700 extends 27 ft; east of point 2500, 94 ft, 4 inches; west of 2300, 10 ft, 4 inches, and east of same, 87 ft, 8 inches. Between 7100 and 7200, have put up 2 posts and 1 cap, and lagged the old sets. Between 6400 and 7200, repaired old sets. Cleaned up debris between 10,300 and 17,000. Between 11,400 and 11,600, placed 380 ft of new covers and 8 new sides of 8x8x20 planks on drain-boxes, and from 19,400 to 19,600, repaired track and placed new guard plank on both sides of the same.

HALE AND NORCROSS.—The large double-track drift running north from the 2800 station is making about 45 ft per week. It is skirting the east side of the ore vein and on the west side occasionally cuts into the edge of what appears to be a strong body of quartz. The drift is being substantially timbered as it progresses, and a drain is put in and covered as the drift advances. The drift will be pushed forward to the Savage south line as soon as possible. It is now out a little over 240 ft and has about 200 ft yet to go to reach the Savage south line. They will probably make some cross-cuts in the Hale and Norcross before the drift is extended up to the Savage line. The usual amount of ore is being taken out on the 200 level and they are preparing to commence operations on the 500 level, with a view to which the machinery at the old shaft is being put in good repair.

MEXICAN.—Virginia *Enterprise*, Sept. 6: The joint Ophir, Sierra Nevada and Union Con. winze below the 3200 level has been sunk and timbered about 8 ft. The usual vein porphyry is taking the place of the bastard quartz which has heretofore been the predominant material at the bottom of the winze. The winze has but about 4 ft to go to reach the 3300 level. It will then be sunk about 10 ft further for a sump, when a station will be opened and a drift started west toward the mineral-bearing quartz found further to the west on the levels above. In speaking of the winze having 4 ft yet to go, we mean that it will to-day be 96 ft below the 3200 level, and will yet have 4 ft to go to reach the 3300 level.

BEST AND BELCHER.—The main west drift on the 2500 level is out about 630 ft. It has passed through the hard rib of porphyry, and is entering a softer and more favorable material. The drift must now be quite near to where should be found the continuation of the body of low-grade quartz cut through on the 2300 level. The north drift from the 825 station of the Bonner shaft is out about 340 ft. It is in a very favorable material.

UNION CON.—On the 3200 level the joint Mexican, Ophir and Sierra Nevada winze has been sunk and timbered 8 ft. After to-day it will have but about 4 ft to go to reach the 3300 level. A sump will be sunk to the depth of 10 ft, when a station will be opened at the 3300 level and a cross-cut started west toward the point where the streaks of gold-bearing quartz were found above. As these streaks of quartz stood about vertical, they must be looked for to the westward.

CON. CALIFORNIA AND VIRGINIA.—The air pipes and car-tracks have been removed from the 2900 to the 1700 level. At the latter point a drift will be started north, passing around the section bulk-headed in some years ago on account of a fire in the old timbers. The drift will be kept outside of the section in which was the fire. It is being

run partly for ventilation and partly to look for the northern extension of the streaks of ore that were being worked in the region where the fire occurred.

ALTA.—The west drift on the 2150 level has been driven through the west wall of the vein and discontinued. It showed a body of quartz 150 feet in width. The water is fast draining out through the two diamond drill holes that were run from the face of the east drift on the 2150 level. The flow of water has so far decreased that the miners will be set to work next Monday at driving the drift ahead toward the vein.

SCORPION.—On the 500 level the north drift is passing through vein porphyry that contains seams of clay and frequent stringers of quartz of a favorable appearance. The company have a vast area of ground (covered on the surface with huge masses of croppings) which should contain rich deposits of ore, but about which not much is known, except on the 500 level.

BENTON.—The drift on the 2150 level is making very good headway in a body of quartz that carries as high as $10 a ton in metal. It is hoped that in going northward on this body of quartz a paying deposit will be found at some point as the quality of the material improves as work progresses in that direction.

OPHIR.—On the 250 level some ore is still being extracted from the fillings of the old drifts. On the 500 level they now have an ample supply of air and are pushing forward the main west drift about 70 ft a week.

SIERRA NEVADA.—Are still repairing the drift on the 2300 level through which passes the compressed air pipe.

CHOLLAR.—Cross-cut No. 2 on the 2800 level is making rapid progress in material of a very favorable character. There is no trouble with water.

ANDES.—A station has been opened at the bottom of the 80-ft winze and a prospecting drift started at that point.

CROWN POINT.—The usual quantity and quality of ore is being taken out on the old upper levels and sent to the mills on the Carson river. A considerable amount of prospecting work is being done.

UTAH.—The material encountered in the south-east drift on the 1950 level is much the same as at last report. The streaks of quartz and seams of clay still continue.

BELCHER.—Sufficent low-grade ore is being extracted to keep the river mills in full and constant operation.

YELLOW JACKET.—About usual quantity and quality of ore is being extracted and a considerable amount of prospecting work is being done.

Banner District.

The Ready Relief, in Banner, has started up at reduced wages, and is getting along slowly. The mill is not running, as C. R. Wellington, with a force of men, is busily making repairs on the same. The Old Hubbard is proving herself to be a paying property. One hundred tons of ore from the waste dump was run through the mill, with a $1,000 result. The Cowles Brothers have worked hard to develop their property and deserve all the good fortune they get.

CARESA CREEK.—Some rich strikes are reported from the desert close to Caresa creek, silver assaying up in the thousands and nickel up to the hundreds, so don't be surprised if the Caresa Creek mining camp (that is to be) leaves Calico in the shade.

Columbia District.

THE POLARIS.—*Times-Review*, Sept. 6: It is the intention of the managers of the Polaris mine, at Columbia, to sink immediately 60 ft further, which will give a depth of 200 ft when drifts will be run and stoping commenced. It is hardly probable that the mill will be started up this season, but work will be prosecuted in the mine, extracting ore and opening up, preparatory to more active operations in the spring. Experienced miners and experts who have examined the mine are unanimous in the opinion that it is the most promising property in the northern country, while its favorable location for easy and economical working, and the facilities for cheap reduction of its ores, are important factors in the estimation of its aggregate value.

Eureka District.

ORE SHIPMENTS.—Eureka *Sentinel*, September 6: Messrs. Anderson & Dibber have been prospecting the Western Globe mine for the past two years, and have made several shipments of rich ore from about the old stopes to the furnaces in Eureka during that time. The upper levels of the mine are so obstructed with waste that it has become necessary to prospect at greater depth, and they are now sinking a winze in virgin ground, with good chances for striking a new ore body. If successful, they will commence running a tunnel from the nearest accessible point in Maryland Mountain, a little above the Rescue Canyon road. The sooner the work is commenced the better it will be for the owners, as there can be no doubt that it will be the means of discovering plenty of ore beneath the old stopes, the indications of which are plentiful. Not only this, there are also veins of ore cropping out of the surface, which the tunnel would cross-cut and be the means of exploring at a fair mining depth.

Julian District.

There is but little doing in the Julian mines. Some little ore taken from the San Diego, which pays wages. Some from the Blue, which worked $118 a ton. Nothing being done in the Big Blue. Work is still progressing on the silver mines near Julian and the owners think they have a bonanza. They claim that some assays have run as high as $1,100, and that the average is $90.

Osceola District.

WORKING ORE.—White Pine *News*, Sept. 5: John Irvine, who has just returned from Osceola, informs us that 33 tons of ore from Capt. Aikey's mine, worked at the Osceola Company's mill, yielded $33 per ton; and 27 tons from Boone Tilford's mine, worked at the same place, yielded $80 per ton. The people over there think it very unfortunate for the district that one or the other of these properties did not fall into the hands of the Osceola Company.

Pinto District.

PROSPECTING.—Eureka *Sentinel*, September 6: There are 25 miners prospecting on Maryland Mountain, Pinto District, 19 of whom are taking out rich ore. Messrs. Finn, Ferguson and Fox have a lease of the surface workings of the Rescue mine, and are taking out some very fine ore, with a prospect for a plenty of it. Andrew Berryman & Co. have a fine prospect on the Silver Nugget mine, Pinto District, which they are working under lease. They are taking out considerable middle class, and some very rich ore. John Steel is making a shipment of 60 sacks of good ore from the old dump, at the Diagonal mine. He is assisted by Charles Fisher, and will resume work shortly in a drift from the main incline, 25 feet below the surface. This is being run on a fissure of fair quality of ore. John Killen has a lease of all that portion of the Queen mine, above the 100 level. He is on the track of ore, and will probably have something soon to repay him for his labor. The lower levels of the mine are being worked by the owners; Messrs. Jones Brothers, who have a small vein of rich ore in the bottom level, which looks as if it might develop into a rich body, such as one of those for which the mine has been famous.

Secret Cayon District.

RICH ORE.—Eureka *Sentinal*, Sept. 6: H. B. McKee and Co. have struck a vein of enormously rich ore in the Endeavour mine, Secret Canyon. Specimens of which will run as high as $18,000 per ton. These have a plentiful sprinkling of free gold which can be seen in the rock without the aid of a glass. This ore is also exceedingly rich in silver, and is very heavy for its bulk. It is to be regretted that the vein is very small but it may increase with depth. Ed. Altweg has some very rich ore on the dump of the Bricktop mine, some of which shows well in horn silver. The Bricktop series adjoin the Geddes & Bertrand mine, Jim Lurry is leasing the Scorpion mine. He has a nice streak of quartz in one shaft, and on another, a body of quartz, rich with chloride and horn silver. It promises to develop finely.

Silverado District.

TUNNEL.—Eureka *Sentinel*, Sept. 6: Jim Nolan, who is as full of energy as an egg is of meat, is running the Grand Republic tunnel rapidly into Silverado Mountain. It is now in 445 feet, and the breast in ore-bearing lime-rock. In a few weeks, cross-cutting will be commenced to intersect the east and west ore veins, a number of which appear in the croppings.

Silver Park District.

BONDED FOR $60,000.—Pioche *Record*, Sept. 3: The mining property owned by Felix Knight, in Silver Park Mining District, we are informed by Elwood Bailey, was bonded for $60,000, in place of $25,000, as has been reported. The property is bonded to a Mr. Eppley, of Salt Lake, for five months, with a forfeit of $1,000 a month, till the mining property is taken. Mr. Knight has obtained U. S. patents to the Summit, Roadside, and Sam Tilden claims, and owns a number of good prospects besides these. A large amount of ore has been stripped and exposed to view in these mines.

Tuscarora District.

NORTH BELLE ISLE.—*Times Review*, Sept. 4: No. 2 cross-cut, east 70-ft level, has been extended 8 feet. Have cut into the east vein, which shows a width of over 2 feet, and carries some high grade ore.

GRAND PRIZE.—South drift on the 400-foot level has been extended six feet. The stopes above the 400 are better than last week. Stopes above the 300 are doing well. Mill is running and doing good work.

BELLE ISLE.—Drift north from east cross-cut, 150-foot level, has been advanced 9 feet; total length, 28 feet. The face shows a good width of milling ore.

NAVAJO.—There is some improvement to note in the south drift, on the 250-foot level; progress the past week, 8 feet. The stopes on this level are looking well at all points. The faces of all the drifts are showing the usual width and grade of ore.

White Pine District.

HAMILTON NOTES.—White Pine *News*, Sept. 5: The Sweetwater Mining and Milling Company are steadily progressing in their different works. During the past week there have been seventeen men in and about the mill employed on repairs. The recent strike in the Stafford continues to improve, the assays ranging higher. J. R. Kendall puts on a force of men to-day upon the Manhattan (California) mill to place things there in order. He has let a contract to two parties to furnish 1,000 cords of wood on the wagon road, where it can be hauled in. Capt. Frank Drake speaks in high terms of the recent discovery on Treasure Hill. He thinks it is likely to prove a large body. Frank Paul, a son of S. F. Paul, of Hamilton, was the discoverer of the bonanza. He had a contract to run 50 ft of a drift, and when he had finished, he noticed an improvement in the ground and kept right on till he unearthed the new find. If it turns out as expected Frank ought to have a long job in that mine.

ARIZONA.

CASA GRANDE.—Cor. *Globe Chronicle* Sept. 6: The Casa Grande Copper M Co., under the management of Wm. B. Hellings, at Copperopolis, has two smelter jackets ready for work under the supervision of J. J. Williams, formerly of the Old Dominion Co., and they started turning out copper bullion last Saturday with average success. It is claimed that they have struck another large body of ore in one of the tunnels. They have erected a coke platform to unload coke handily at this point from the cars of the Southern Pacific Railroad.

MOHAVE MINES.—*Miner*, Sept. 1: Of all the wealthy mining camps of Mohave county, Stockton Hill takes the lead, both in the great variety and richness of its ores, as well as in the number and extent of its mineral-bearing ledges. Here are found veins of gold, silver, lead, copper, antimony, zinc and other minerals, only needing capital and labor to enable them to add their hidden stores to the wealth of the country. There are now some fifty men engaged in mining on Stockton Hill, while more are being added every few days. The Franklin mine, is owned by Wm. Engle and Caldwell Wright where three men were found at work stoping out a piece of ground lying between two shafts, and taking out some very fine ore, which was sorted up into two classes, the first of which assays in the neighborhood of $300 to the ton in silver, while the second class ore runs about 100 ozs. The Moonbeam mine, is owned by J. M. Gale & Co. Here five men were found at work, extracting the precious metal, and the metal from this claim is indeed precious, seeing that the last car-load of ore from the mine sampled 397 ounces in silver at the Cerbat mill, while the second class ore runs about 90 ounces. Mr. Gale is at present occupied in both sinking and stoping and with five men is taking out about 2 tons of first class ore and five tons of second class ore per week. The old Cupel mine, has contributed a larger amount than any other claim to the sum total of the wealth extracted from the mines of Stockton Hill. In early days chloriders took out as much as $175,000 from this valuable claim, the surface of which is at present entirely honeycombed with old workings. This claim needs to be sunk to a depth of at least 500 feet before it can be again put on a paying basis. At present there are two or three men sorting over the old dumps which they have purchased of Messrs. Spruance Stanley & Co., owners of the mine, and they appear to be making a good thing out of it. Up to date they have shipped two car-loads of ore to Pueblo, and have some 320 sacks more, ready for shipment.

REDUCED WAGES.—Prescott *Courier*, Sept. 3: The new arrangements under which the miners at Tombstone will resume work at reduced wages, promises to restore its old time prosperity to Cochise county. As the cut in wages is due solely to the falling off in value of the quartz produced by the principal mines, we hope to see the old rates re-established with the looked for early development of new ore bodies.

MOHAVE MINES.—*Miner*, Sept. 6: The Gold Basin district will soon come to the front again. Messrs. Hall & Co., of Denver, will commence work in a few days to prepare for the erection of their mill. An abundance of water has been found and no further difficulty is anticipated on that score. Dave Parkes and Tom Tyrrell are working on the Southern View, at Wallapai mountain, and taking out ore that will assay about $600 to the ton. The work of connecting the tunnel and main shaft on the Deen mine for the purpose of obtaining good ventilation still goes bravely on. According to actual measurement the distance from the floor of the tunnel to the bottom of the shaft above is 124 ft, of which 100 ft was completed last Thursday in just 4 weeks from the time of commencing the work, and as the men are making 4 ft a day it will be but a few days until the connection is made. When this is done more men will be put on and large shipments of ore may be expected. J. M. Quine is shipping some fine galena ore from his claim near Sherum's peak.

IDAHO.

COEUR D'ALENE MINES.—*New Northwest*, Sept. 6: Mr. Stillwell arrived here this morning. He got into the Coeur d'Alenes last spring; has an interest in three producing claims, and is out for a few days' business. He is an experienced miner and a reliable man. He gives it as his opinions that the Coeur d'Alenes are good. Of the 2,000 men there, nearly all are at work. Recently there were no idle men; but a few days ago a company taking out a 12-mile ditch to carry 4,000 inches of water from Pritchard creek to the old gravel beds between Eagle and Butte, suspended and discharged 250 men, which leaves some idle. The enterprise is a promising one, and he thinks it will be completed yet this winter. A considerable number of companies have not got to sluicing and are generally doing from fair to first rate. The bankers now estimate the weekly product of the gulch at from $8,000 to $10,000. This is being taken out by about 300 men. It is the hardest gulch to open he ever worked in. The ground is deep, densely covered with timber, very flat, and the water is troublesome. The gold in the shallower diggings is mostly on bedrock.

MONTANA.

A TEMPORARY SUSPENSION.—*Inter-Mountain*, Sept. 2: For the past three years, almost without interruption, operations have been continued at the Anaconda, and with ceaseless regularity the cages have ascended and descended the shaft. The machinery and workmanship in the mine have been of the best. The utmost care has been taken to procure durability and prevent delay, and all that was possible in this direction has been secured. But iron will wear, and shaft timbers will settle and get out of plumb, which is the cause of the shutting down of this property for the next week or two. The air compressing apparatus is in need of extensive repairs, and the guides in the shaft require adjustment. The men cannot work in the mine without air, and it is impossible to work in the shaft with cages constantly running up and down, and the present was thought the best possible time to prosecute the necessary repairs and put the mine in shape.

NEW PLACER DIGGINGS.—A special dispatch to the *Independent*, from Benton, says that city is all excitement now over the report that rich placer diggings had been discovered in the Little Rocky Mountains, about one hundred miles east of Benton. Parties are rapidly outfitting to go. Gold from the new mines has been sold at Maiden and Fort Assinaboine, and it is said that it was taken out without sluice-boxes or any of the usual facilities for washing. The discovery gulch is five miles in length. The trip can be made from Benton in mackinaws down the river, as the gulch is only a few miles from the river. A big stampede is expected.

THE HELENA CO.—Helena *Independent*, Sept. 8: The Helena Mining and Reduction Company's property has taken its place in the front rank of the valuable mining properties of the country, and demonstrated in a most striking manner the difference between the close, careful and systematic working of a property by skillful and trained manipulators and the hap-hazard operations of novices or mere empirics. A large outlay has been made during the last year in order to secure the economical development of the mines and the reduction of their output, but the profits of the company have kept steadily advancing beyond the expenditures made upon the mines and works, and the ratio of cost of manipulation has been largely reduced in the mean time. A good idea of the progress made in the direction of economical handling of the ores may be had by observing the present cost of smelting as compared with the earliest operations of the old Alta Montana Co. upon the same property, when the mere cost of running the furnace charge through the water-jacket aggregated more than twice the present cost of the entire operation of roasting and smelting. These results, reached so satisfactorily, are largely due to the fact that the present works are properly constructed as well as properly operated. With all the vast product of ore worked from the Alta and Comet mines since the immense works were completed, the quantity now in sight in each of these veins is estimated to be quadruple the quantity available when they were started under present auspices. The tunnels that have penetrated the Alta mountain have opened up an entirely new chute of ore that is now known to extend from the lowest point opened, fully 750 upward, and the characteristics developed are as promising as at any point in the older workings of the mine. The Emerson lode is owned by the Clancy Creek M. Co., and is at the head of Clancy creek, about half way between Bald Mountain and Gregory mine. A tunnel has penetrated the hill on which this lode is located for a distance of 100 ft, and has struck pay at a distance of 170 ft from the surface, and the vein matter has been explored for a distance of 9 ft across from the first wall encountered without reaching the other wall. Another tunnel at "Old Baldy" is running into the mountain on the Buckeye lode to strike the vein at a depth of 250 ft below the present shaft, which is now 50 ft deep and shows the vein at the bottom to be about 3 ft wide. At the present lowest point reached it is claimed that the pay streak carries from 50 to 80 ounces of silver to the ton. It is owned by the Bald Mountain Mining Company of Minneapolis. An important purchase has been made recently by Elijah M. Dunphy, of this city, who now owns exclusively the General Grant, General Sherman, and General Jackson lodes, and three-fourths of the Good Friday, besides the water rights, ditches, etc., formerly owned by Andrew J. Arnold and others on Red Mountain in the vicinity of the Nellie Grant mine—a large proportion of which is also owned by Mr. Dunphy. It is understood that within a short time these valuable properties will be developed by a large tunnel driven into the mountain so as to cut several leads. As to the richness of these lodes there is no doubt whatever. W. S. Negus and H. T. Jacobs are making good returns for their outlay in the Homestake mine in the Stemple district on the main range. On the 5th of July they bought in $12,000 gold, and on the 23d inst. they cleaned up $10,000 more in their little mills and Mr. Jacobs says they "have better rock now." These two clean-ups came from less than 400 tons of ore. The sixty stamps of the Drum Lummon mine will start to-morrow, and if the returns from this famous property do not surprise those who have not been "taking notes" lately, then it will be on account of some accident that will cause unlooked for delay. With the increasing returns from the mines at Wickes, Maryville, Gloster, Elkhorn, and other tributary camps, Helena is destined soon to register shipments of the precious metals to the markets of the world in such amounts as will bring her name into prominence in every quarter of the globe.

NEW MEXICO.

VICTORIA DISTRICT.—Cor. Globe *Chronicle*, Sept. 5: Victoria mining district is situated in the southern part of Grant county, N. M., 30 miles north of the lines of Old Mexico, and 3 miles south of Gage station, on S. P. R. R. The district received its name in commemoration of old Victoria, who, in years gone by, made this his stamping ground. The mines were discovered about three years ago, and have proven, under present management, to be dividend paying. They lay on the summit of a round limestone mountain, which is situated in an open prairie. Said mountain rears its peak 300 ft above the surrounding plain. The ore is a carbonate, which lies in pockets or chimneys, and when once opened is very easily extracted. It is then freighted on wagons to Gage, from there shipped to Socorro and smelted. The average grade of ore from this mountain is about $50, and is uniform, varying only a few dollars in several thousand tons. Development work is very slow and expensive, owing to the silicious and irony nature of the limestone, but when once a drift is run or a shaft sunk, it never requires timbers, which makes a compensation for labor and money expended in running through such hard rock. There are two groups of mines which produce ore steadily. The first I will mention is the Victoria, which is owned by a St. Louis company. Mr. Frank Nicholson is general manager, and has been in St. Louis since the commencement of work until very recently. He has now come to stay a few months and has brought along with him that ever indispensable being to man's happiness—a lovely and accomplished young wife. Since last February the company has cleared $40,000, making the owners financially happy. The Chance mine adjoins the Victoria on the south and is a very valuable property. The ore is, as in the Victoria, in large deposits, encased in limestone, and is superintended by Mr. Neil Boyle, an old and experienced miner of Nevada. It has produced some 20,000 tons of ore in the last two years, and has several thousand ready for shipment. The town or camp is called Fullerton, and consists of about 20 houses, frame and adobe. Water is hauled from Gage in tanks for mine and town use.

UTAH.

REVIEW.—Salt Lake *Tribune*, Sept. 5: The receipts of bullion and ore in this city for the week ending September 3d, inclusive, were, of bullion, $118,858.48; of ore, $7,850; of both, $126,708.48. For the previous week the receipts of bullion were $105,989.14; of ore. $12,840; total $118,829.14. During the same week the Horn Silver shipped nineteen cars of bullion, $57,000; bringing the total shipments for the year up to $1,669,000, out of which three regular dividends of $300,000 each have been paid. The Ontario shipped during the week 46 bars of bullion, assaying $33,778.08. Its product for the year to this date amounts to $1,128,067.64. Out of this eight regular monthly dividends of $75,000 each have been paid. The Crescent sent in two lots of ore, of the value of $5,000. The Stormont sent up two bars of silver, worth $3,160. The product of the Hanauer smelter for the week was nine cars of bullion, $16,950.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

THE CUMMER ENGINE CO.

CLEVELAND OHIO

SEND FOR 150 PAGE ILLS CATALOGUE.

AUTOMATIC

Awarded highest premiums at Cincinnati and Louisville Expositions of 1883, for "Best Automatic Engine." We will furnish anyone copies of the ORIGINAL ENTRIES of several engine builders who claim they were not competing with us. They all entered in the same class with us, and now by deceptive Circulars (one headed "Fact versus Falsehood,") attempt to mislead.

No premiums were offered for Condensing Engines.

JOSHUA HENDY MACHINE WORKS, Agents for the Pacific States, 49 & 51 Fremont St., San Francisco.

DEWEY & CO.'S

Scientific Press **Patent Agency.**

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE

Cheapest and Most Effective Machine

OF THE KIND NOW IN USE.

Adapted to All Grades and Classes of Ores

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coarser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

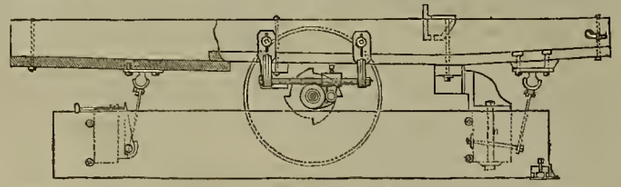
PATTEN'S

CONCENTRATOR AND AMALGAMATOR COMBINED.



This machine requires less power, less care or attention, and is less liable to get out of repair than any Concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all millmen, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

The undersigned is now located at the Ætna Iron Works, 217 to 221 Fremont street, where he is building the above machines and prepared to fill orders, and guarantee them to do all that is claimed. Weight 625 pounds; price, $300 **Estimates given and orders promptly filled for all kinds of Mining Machinery.**

Assays and practical working tests made of ores.

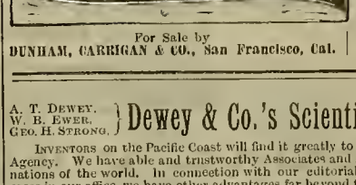
THE JENKINS STANDARD PACKING



IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "**Jenkins Standard Packing**," and is for sale by the Trade generally.

Manufactured only by
JENKINS BROS., 71 John St., New York.

For Sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

The "Triumph". Concentrator to the Front Again.

Having started the ball in motion; having inaugurated the recent agitation in regard to the important subjects involving the best methods of concentrating the valuable metallic particles of ores, and the best forms of concentrators, pans, vanners, separators or other concentrating devices, we ask you to again afford us space in the columns of your valuable mining and scientific journal for a further discussion of the matter, and in reply to the article which appeared in your issue of August 30th.

The proper concentration of ores suggests a problem of vast complications, and innumerable machines have been conceived, devised and constructed, intended to solve this knotty proposition which affects the immense pecuniary interests of all mining men and mine owners in all of the mining districts of the world.

This agitation which, in its incipiency, involved only the merits and demerits of the "Triumph" Concentrator and "Frue" Vanners has already, at this early stage, drawn into the controversy the "Duncan" pan and its aged father the "Hendy" amalgamator, and the pseudo "Embrey" machine, and the probabilities are that the rag, tag and bobtail of other conceptions will soon be following the procession.

Believing in the merits of the "Triumph" Concentrator, we invite, and are prepared for a fair, free and full discussion of the merits of any and all machines which may enter the lists, and we hope that one or a series of competitive trials may be arranged, in order that the superiority of either one or another may be fairly, impartially and decisively determined. We ask this for the reason that the best interests of mining men everywhere will be ultimately subserved by the open and honest competition which we propose.

Reverting to the article dedicated to the "Frue" Vanner of August 30th, above alluded to, we have to say that touching upon the matter of patents and infringements, we deem these to be properly subjects of judicial investigation and decision, and appreciating the sound basis upon which the patents of the "Triumph" Concentrator rest, we are ready to guarantee their purchasers against all losses, damages or expenses which may be incurred by them by reason of any infringements of any existing letters patent of any other concentrating devices.

With regard to the competitive trial recently had between two "Triumphs" and two "Frues" at the Empire mill, in Grass Valley, we wish it to be distinctly understood that every fact and figure stated in the articles which appeared in your journal of August 16th and in the daily and weekly *Stock Exchange* of August 21st and 22d, were compiled and derived from written and verbal reports of the Superintendent of that property, and nothing was concealed or exaggerated. The statement that "40 ounces of amalgam were saved by the two 'Triumphs,'" was made verbally by the Superintendent in the presence of the managing owner of the O. E. M. and M Co., the President of the Joshua Hendy Machine Works, and the writer of this article. Without questioning its reliability we embraced the coin value of the stated amount of amalgam saved to the compilation of figures, and being given to us officially, the right to use them cannot be doubted. We have, however, now at hand a complete report of the trial, over the signature of the superintendent, which modifies this amount of amalgam, but changes no other figure or statement heretofore made use of. The quantity and value of the amalgam actually saved was verified by the superintendent after his return to Grass Valley, and accurately ascertained to be 5 ounces, having a value of $5.00 per ounce, or $25.00, taken from the feed-bowls of the two "Triumphs;" none being saved by the two "Frues," we therefore make the "amende honorable" for this unintentional error.

The net gain of the "Triumphs" over the "Frues" is consequently as follows, viz.:

Net value of concentrations	$199.15
Net value of amalgam	25.00
Net gain in favor of "Triumphs"	$224.15

The fact that the "Frue" Vanners do not save any amalgam, is substantiated not only by the result of the test cited above, but by Isaac E. James, Esq., superintendent of the Carlisle Mining Company of New Mexico, in his report of a competitive trial had in February and March last, in the mill of that company, between five "Frue" Vanners and six "Duncan" pans, under his personal supervision, and verified over his own signature, and in which he states that *no amalgam was saved by the five "Frues."*

With reference to the question(?) of *too much water*, alleged as a reason why the *"Frues worked under a great disadvantage,"* we have this to say, and we think the answer will be sufficiently explicit to any mill or mining man; that an exactly equal distribution of ore-pulp and water from the two batteries over the four machines, being perfectly arranged and provided for by pulp troughs and delivery pipes, that each of the four necessarily received the same quantity of pulp and water, and operated under equal conditions, and there being *too much water* for the "Frues," why was there not *too much water* for the "Triumphs"? Echo still answers, "why!" The fact is, there was not a sufficient quantity of either pulp or water delivered to the two "Triumphs" during the test to determine their full capacity. In proof of this we cite the fact that 450 tons of pulp were distributed to the four machines during the run of 24 days, which gives an average delivery of only 4.65 tons of pulp, to each machine, per day of twenty-four hours; and we claim that where ores contain not more than three per cent of sulphurets or pyritic matter, that three (3) "Triumphs" will properly concentrate the gangue matter from two batteries of 5 stamps each, say 10 stamps, having a crushing capacity of two (2) tons per stamp per day, or say 6.66 tons of pulp, to each concentrator per day.

Passing to a consideration of the statement, that "the tailings from the 'Triumphs' assayed one-half higher than the 'Frue' tailings, etc.," we state that samplings of the tailings from the four machines were carefully taken at appointed times during each day of the trial, and that we have had each day's samplings carefully assayed by W. D. Johnston, Esq., assayer and chemist of this city. The mean results of those assays show an *excess of loss* in the tailings passing from the "Frue" Vanners of $1.02 per ton over those passing from the "Triumphs."

We have had these assays tested by other assayers, but the correctness of Mr. Johnston's results carries its own verification in the fact that the gross gain of the "Triumphs" over the "Frues" was as follows:

Gross gain in value of concentrates	$222.31
Gross gain in value of amalgam	25.00
Total gross gain	$247.31

Or say, $1.10 per ton for the 225 tons treated, and we find the *excess of loss* in the tailings passing from the "Frues," for 225 tons at assay value, $1.02 per ton equals $229.50 — demonstrating that the loss by the "Frues" was gained by the "Triumph."

The insinuation thrown out by the agents of the Frue Vanning Machine Company, that "our acceptance of their $1,000 challenge was an attempt to make capital cheaply by advertising what we have no intention of performing," is not up to the standard of business qualifications with which we have heretofore credited those gentlemen. When the challenge was originally offered there were certain improvements being made in the construction of the "Triumphs," and, as we have before stated, we bided our time until those improvements should be perfected. It ought to be a matter of congratulation to the agents of the "Frue Vanner" (to the amount of one thousand dollars) that we did not accept the wager for the trial at the Empire mill, for we should have pocketed that sum had they had the fortitude to put up.

The fact remains that we have publicly accepted the challenge, and we now and hereby reiterate our acceptance of the same for $1,000, or any other sum, and are ready to enter into a competitive trial with two or more "Triumph Concentrators" against an equal number of "Frue" Vanners, upon the following terms and conditions, viz.:

1st. That arrangements for a suitable quartz mill of standard stamping capacity and proper pulp delivery accommodations, shall be provided.

2d. That the trial shall continue during a certain number of consecutive days.

3d. The best form of and materials entering into the construction of the machines, combined with the least wear and greatest apparent durability.

4th. The most satisfactory practical operation, with the greatest ease of adjustment, and the minimum amount of power required in driving, together with the largest quantity of pulp treated, and the most perfect uniformity and steadiness of motion.

5th. The largest net bullion value accruing from the yield of concentrations and amalgam (estimated separately).

6th. The least loss of value per ton in the tailings; and that perfect fairness, the strictest impartiality, and honest operations, shall be the factors and conditions which shall determine the test; and upon these terms we are willing and eager to take the chances, and if the fates be against us, we shall neither quibble, squirm nor squeal.

Mining Share Market.

The stock market shows a slight advance at the close of the week, though there is little animation in the market. Work is progressing favorably at all points along the Comstock lode, and very important work will be commenced soon in several places. The joint Mexican, Ophir, Sierra Nevada and Union Consolidated winze will soon be down to the 3300 level. A sump 10 feet in depth will then be sunk and a station opened, from which a cross-cut will be started west for the veins of gold-bearing quartz found above. As the quartz encountered above stood about vertical, it must all be looked for to the westward; none of it made its appearance in the lower part of the course of the winze. At the Imperial, Alpha and Exchequer, they have developed a large and strong body of quartz on their 600 level, but it carries only a few dollars a ton in the precious metals. It is thought this deposit may be better toward the surface, and an upraise will now be started and pushed to the 500 level, where explorations will be made.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING SEPTEMBER 2, 1884.

304,398.—MATCH SPLINT MACHINE—Arnold & Wimmer, S. F.

304,499.—TRACE BUCKLE—Wm. J. Butler, Salinas, Cal.

304,631.—SAW JOINTER—John Eutsler, Wallace, Cal.

304,431.—SHOE—C. J. Heyler, San Jose, Cal.

304,329.—FARM GATE—L. J. Johnston, Petaluna, Cal.

304,537.—ROCK BREAKER—Geo. H. Malter, S. F.

304,658.—SHUTTER WORKER—Masters & Kimball, Sacramento.

304,343.—TREE PROTECTOR—F. H. Merrill, S. F.

304,469.—SHINGLE MACHINE—C. A. Tarragen, Portland, Or.

304,373.—PICK—D. E. W. Taylor, S. F.

Patents Allowed.

Among patents recently allowed, and not yet announced, we are at liberty to mention the following which will soon issue:

METAL SHEARING APPARATUS—R. I. Knapp, Half Moon Bay, Cal.

RAILWAY CAR—Henry Root, S. F.

SULKY CULTIVATOR—W. H. Roberts, Santa Clara, Cal.

CULTIVATOR—M. M. Estee, S. F.

WRENCH—B. Elmore, Etna, Cal.

DERRICK FORKS—C. Stone, Walnut Creek, Cal.

JOINT PROTECTOR AND IGNITER FOR FUSE—E. A. Thompson, Silver City, I. T.

VEHICLE SIDE SPRING—Z. M. Howell, Salida, Cal.

ENGINE VALVE—H. Behr, S. F.

BALANCE ROTARY VALVE—H. Behr, S. F.

BALANCE ROTARY VALVE—H. Behr, S. F.

BALANCE ROTARY VALVE—H. Behr, S. F.

BALANCE SLIDE VALVE—H. Behr, S. F.

BUILDING CONSTRUCTION—E. L. Ransom, S. F.

GRAIN SEPARATOR AND CLEANER—A. W. Lockhart, Sacramento.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento Co.
A. C. KNOX—Nevada (State.)
B. W. CROWELL—Fresno and Tulare counties.
GEO. MCDOWELL—Plumas and Sierra counties.
WM. PASCOE—San Francisco.
WM. H. COOK, Los Angeles Co.
H. G. PARSONS—Idaho and Montana.
G. W. IOALLS, Arizona.
M. S. PRIME—Contra Costa county.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufacture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.
2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough oil to prove what we say. Our oil has now been adopted as

Cheaper, More Economical, and More Serviceable than any other Oil

On the Central and Southern Pacific Railroads, the Northern Pacific, South Pacific Coast, and North Pacific Coast Railroads, the Oregon Railway and Navigation Co., Pacific Coast Steamship Co., and all the prominent Iron Works, Saw-mills, etc., on the Coast and Puget Sound. ADDRESS:

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

ECLIPSE DOUBLE TURBINE WATER WHEEL

Points of Superiority:

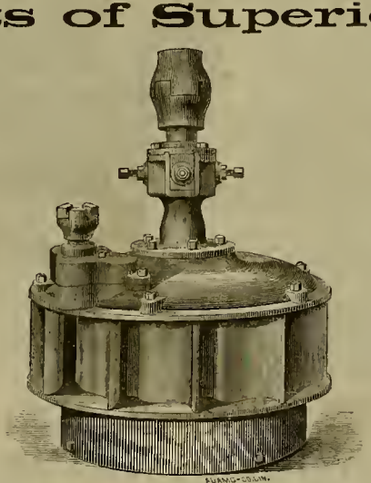
FIRST.—Simplicity, being composed of the smallest possible number of parts.

SECOND.—The Wheel, Outer Case, Register Gate, and Top, each being one casting, and all the work on them being performed by machinery, and fitted to a standard gauge, secures the highest perfection in construction and operation, and the utmost strength.

THIRD.—The entire absence of rods, bolts, levers, light castings, or "traps" of any kind, securing the greatest durability, with entire immunity from derangement of parts and breakage, so common in all complicated wheels.

FOURTH.—The conical interior of the wheel, which secures perfect freedom of vent for both tiers of buckets, enabling the wheel to rid itself immediately of "dead water" without friction. This feature is entirely original with this wheel, and is found to be of very great practical importance.

FIFTH.—Its "Duplex Chute," formed by the Register Gate and outer case. The outer case moulds the current of water, delivering it in a solid body through that part of the Chute comprised in the Register Gate on to the wheel. This Chute being fixed, the direction of the



current is never changed, nor its velocity checked, consequently nearly the same per cent. of power is obtained with the gates only partially drawn as when fully open.

SIXTH.—A Gate thoroughly protected from vertical pressure, which, when partially closed, does not break the column of water or change its proper direction, which is easily operated, and yet shuts so tight as to prevent leakage; and the shutting of which is not likely to become obstructed or prevented by foreign substances.

SEVENTH.—The housing up of the pinion and segment for operating the gate, which entirely prevents all danger of breakage by foreign substances getting between the teeth. No other concern does or can use this improvement, which effectually does away with a source of most frequent annoyance and delay.

EIGHTH.—The amount of power it yields, together with its Simplicity, Durability and Strength, fairly entitles our wheel to the name given it, The Eclipse Turbine. In further proof of the power of this wheel, we invite a careful inspection and comparison of our tables with corresponding tables for all other similar wheels.

TATUM & BOWEN, Sole Agents,

Nos. 25, 27, 29 and 31 Main St, San Francisco, Cal., and Portland, Oregon.

PROGRESSIVE SCIENCE IN OPTICS.—There is no calling requiring such constant study as that of a first-rate optician, to whom the progressive developments of the present day continually present new difficulties and problems to solve. By close attention to his profession, and over thirty years' practical experience, C. MULLER, the well known optician, 135 Montgomery street, has gained for himself the gratifying distinction of being the leading optician of the Pacific coast. All complications of defective vision most carefully tested free of charge. Sole depot of Pebble Spectacles. 2

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE HARMON SEMINARY,

Berkeley, Cal.

A BOARDING AND DAY SCHOOL FOR YOUNG LADIES.

The Next Term will open July 31, 1884.

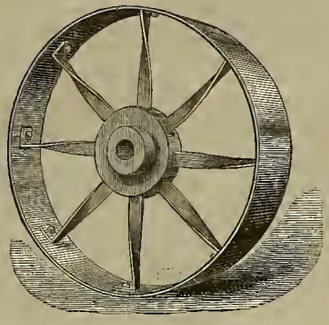
ENTIRELY RENOVATED & NEWLY FURNISHED.

Sunny Suites and Single Rooms with or without Board at reasonable rates. Hot and Cold Water. Folsom street cars pass the door. Location and Appointments unexcelled in San Francisco.

Iron and Machine Works.

MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

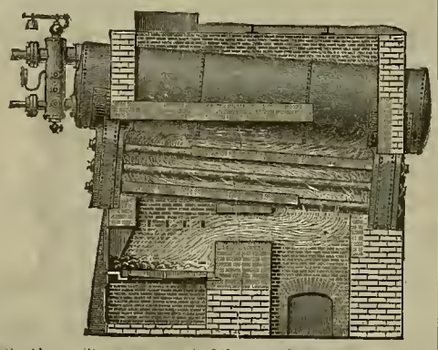
Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, MO., Sept. 23, 1883.

Messrs. Adolphus Meier & Co.—GENTLEMEN, We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER-BUSCH BREWING ASS'N.

OFFICE OF SUPT OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

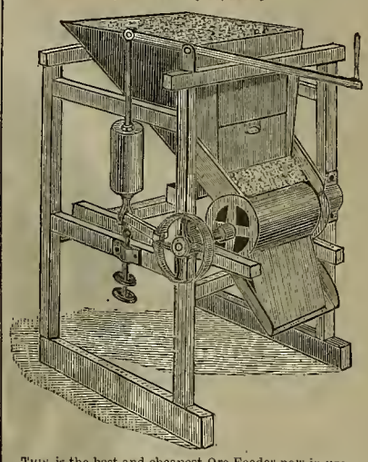
THE ROLLER ORE FEEDER
[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

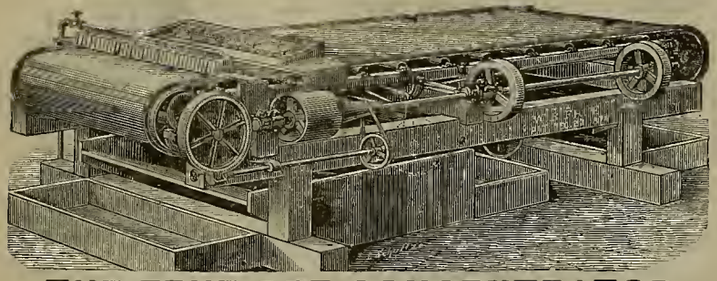
SAN FRANCISCO TOOL COMPANY, - - 11 Stevenson Street, S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

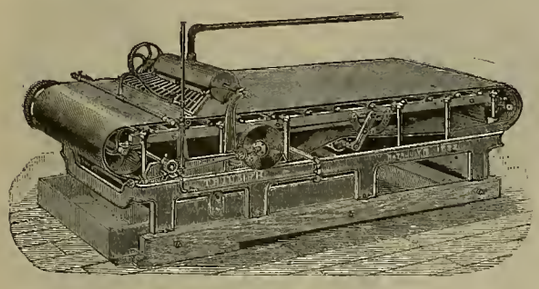
The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B. We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the **"Triumph" Ore Concentrators** and the same number of **"Frue" Vanning Machines**, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $109.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000**, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

The Clerk Gas Engine.

We give on this page a cut illustrative of a ten horse-power gas engine, manufactured by the Clerk Gas Engine Company of Philadelphia, Pa., for the sale of which the Joshua Hendy Machine Works, of Nos. 39 to 51 Fremont St., this city, are the agents for the Pacific Coast States. These engines are designed to meet a want long felt in this community, for many economical uses, being safe, light and durable, and admirably adapted for many purposes where steam power cannot be employed.

They are specially serviceable for use as motors for printing offices, workshops, laundries, factories, where sewing and bag machines are operated, and in hotels, public institutions and private buildings where pumps, elevators or electric lighting machines are in use, and generally in cities and towns (where gas is obtainable) for all mechanical operations requiring small driving powers.

They are extremely simple in their construction, have no gearing wheels, and are noiseless in their movement. One ignition is made at every revolution, instead of one ignition in two or more revolutions, as occurs in most other forms of gas engines, and the power produced is therefore greater for the size of the engine. By a special and simple arrangement, all tendency to back ignition is avoided, and these engines may be operated to their entire available capacity without irregularity.

Their power being very large in comparison with their weight, they can be placed and operated on lighter foundations or floors than any other style of high-power gas engines, which is a matter of important practical convenience and consideration.

Special attention is given by the manufacturers to simplicity of detail in their construction, and their material and workmanship will be found to be in accordance with the best mechanical engineering practice. The Joshua Hendy Machine Works have numerous testimonials of their efficiency and economy from users in England, France and the United States.

Estimation of Sulphur in Coal.

Sulphur generally exists in coal as a sulphuret of iron, and as the presence of more than two per cent of sulphur depreciates the market value of coal, owing to its destroying the iron boilers and grates under and over which the coal is consumed, it is always an important part of the examination of coal to ascertain the quantity present. Mitchell recommends the following process to determine amount of sulphur:

Take one part of finely pulverized coal and mix it in 7 to 8 parts of niter, and 16 parts of common salt, and 4 parts of carbonate of potash, all of which must be perfectly pure. The mixture is then placed in a platinum crucible and gently heated at a certain temperature; the whole ignites and burns quietly. The heat is then increased until the mass is fused; the operation is finished when the mass is white.

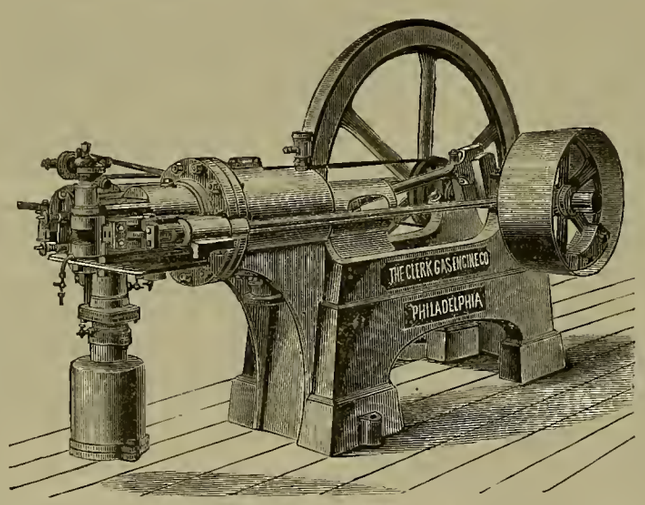
It must when cold be dissolved in water, the solution slightly acidulated by means of hydrochloric acid, and chloride of barium added to it as long as a white precipitate forms. This precipitate is sulphate of baryta, which must be collected on a filter, washed, dried, ignited, and the filter burnt away, and the remaining sulphate of baryta weighed; every 116 parts of it indicate 16 of sulphur.

Hoisting Ropes in Mines.

On account of the weight of unbalanced winding-ropes in mines, large engines are needed to start the load, and a number of plans have been devised to meet the difficulty. Many years ago some degree of compensation was gained by the flat hemp ropes coiling upon themselves, which were in general use; and similar ropes of aloes fiber are still preferred in Belgium and France, but they are almost entirely displaced in England, Germany and America by round ropes of iron or steel wire coiling upon a plain cylindrical drum. To counterbalance the rope in these cases, heavy chains attached to a secondary drum, or weighted levers, have been used. The drum has been made conical, the first lift being taken at the smallest diameter; but the extent to which this can be carried is limited, and it is scarcely safe to make the pitch of the cone more than an angle of 30 degrees with the horizon. By adding a spiral groove in which the rope can lie, this angle may be increased so as to make the drum almost strictly compensating; and this scroll drum (the principle of which was patented so long ago as 1776) is the one now being adopted at most of the largest modern winding plants in Europe. Round ropes, coiling upon themselves in a vertical groove between two iron discs, are in use at Clifton colliery, near Manchester, and are giving satisfaction, as the ropes are found to retain their form and to wear well. With a plain cylindrical drum the empty winding-rope may be effectually counterbalanced by attaching a rope of similar weight underneath the cage. Herr Koepe, of Hannover colliery, Westphalia, has revived a system of winding by which the usual drum may be dispensed with, and its place taken by a simple sheave of large diameter, which may be fixed over the shaft. The main rope from one cage passes partly round this sheave, and is attached to the other cage, while a secondary rope of like weight hung beneath the cages serves as a counterpoise; or the winding-rope may be an endless one, passing through the cages, which are attached thereto by clamps. This system is now in work at Bestwood colliery, near Nottingham.

Using Waste Coal.

The utilization of which are ordinarily waste products is a question which is being studied by many persons. In no branch of industry is there so much waste as in the mining and preparation of anthracite coal. The Philadelphia and Reading Coal and Iron Co., not very long since, found, by estimation, that they had over 60,000,000 tons in their dirt banks, of which about 40,000,000 tons could perhaps be utilized. This includes remarkable sizes of coal, from "buckwheat" to "small stoves;" they have put up jig houses to sort this coal. This company burns the culm or waste under 200 boilers, and at 15 or more collieries. At very few of these collieries have they been burning what is known as good coal for years. They burn "slag," the result of the slate pickers' labors, but in this there is plenty of good coal. Not very long since they determined to burn culm instead of coal. The method adopted at the Schuylkill colliery, where there are eight boilers, is as follows:



THE CLERK GAS ENGINE.

Immediately behind the breaker stands the culm bank. The boilers were built up against the bank, and these furnaces were furnished with sheets of perforated iron instead of bars. Each has a blower of the steam jet pattern. From all accounts, culm raises steam more quickly than coal. The fireman opens the furnace door, and going to the culm bank, not ten feet away, throws in shovelful after shovelful from the bank. Large pieces of rock and slate find their way into the furnace, as well as other material. The rock and slate come out of the fire in much the same condition as they go in—a little cracked and the rock perhaps shriveled, but by no means consumed. The other parts of the bank are burned to ashes.

A mixture of anthracite slack or culm, with bituminous coal, is largely used in New England. The culm is also used in some locomotives, which use the Wootten boiler for generating steam.

A VESSEL came into port this week from Germany, with 600 tons of scrap iron for the Oakland Nail Works.

Patent Office Models.

For a great many years the Patent Department of the United States Government required models of inventions to be sent with the application for patent. The rule worked a hardship on inventors, who, in very many cases, had to spend more money for their models than for fees and other expenses of the application. Sometimes these models cost up into the hundreds of dollars. The expense of transmission from distant points added to cost also. In addition to the models drawings had also to be made.

Some little time since the rules of the Patent Office were changed, so that models are no longer required, except in special cases. The officials have a right to call for a model should the apparatus or mechanism be so complicated that a drawing does not give a sufficiently clear idea. But in most cases no models are asked for, the drawings alone, with the specification, being sufficient.

This is here stated for the information of many who suppose models of inventions are still essential. Persons who applied for patents some time ago, when models were necessary parts of the application, and now applying again, are not all aware of the new regulations. All that is now necessary is a good, clear specification, written by an expert in such matters, and plain drawings of details, varying in number and elaborateness according to the subject. This makes the drawing of specifications a somewhat more difficult matter than formerly, owing to the specification writer having frequently to work from very crude drawings, as people cannot always explain exactly in a clear manner what they have invented. With models to work from, of course a writer can more easily understand details. But when good drawings are made they answer every purpose of the model. It was a wise provision of the Patent Office to abolish the models.

THE COMET CRUSHER.—The suit of David R. Fraser, Thomas Chalmers and H. H. Scoville, Jr., vs. The Gates & Scoville Iron Works, which has been pending for some time in the Circuit Court of the United States for the Northern District of Illinois, has lately been decided in favor of the complainants (Fraser, Chalmers & Scoville). This suit was brought for the infringement of letters patent of the United States granted to J. W. Rutter, being Re-issue No. 3,633, dated September 7, 1869. The Court, Judge Blodgett sitting, held the Rutter patent to be valid, and found that the said defendant, the Gates & Scoville Iron Works (now the Gates Iron Works) had infringed the first claim thereof. This decision was obtained after a full hearing. The crushers known as the Comet contain the invention secured by the said Rutter patent, which covers an important feature. The crushers manufactured and sold by the Gates & Scoville Iron Works advertised as "The Greatest Crusher on Earth," contain the same valuable feature, and, as decided by the Court, are an infringement of the said Rutter patent, which Messrs. Fraser & Chalmers control. Messrs. Fraser & Chalmers, the manufacturers of the Comet crusher, have issued a circular calling the attention of parties using "The Greatest Crusher on Earth" to the fact that they are liable, as well as the manufacturers, for using machines infringing upon patents controlled by them.

Quartz Jewelry.

An Industry Confined to the State of California.

The making of quartz jewelry is peculiarly a California industry. Its manufacture, says the *Chronicle*, was begun in the early days following the gold discovery. At first miners and others of that class had the quartz roughly cut and as roughly mounted it in gold in some shape approaching an ornament. The two firms who twenty years ago represented the quartz jewelry industry were of this city and conducted business under the name of R. B. Gray and Frontier & Bellmere. Both have long since abandoned the business and have divided the mantle of their trade amongst several jewelers. But the city is too small to permit of any house making one branch of business a specialty and though there is one firm which has given to California quartz a great prominence in its manufacturing establishments, yet the patronage for quartz trinkets, compared with more valuable articles, is so small that it hardly pays the proprietors tomore extensively engage in its manufacture. No proverb is truer than that "no prophet is without honor save in his own country," and this saying is equally applicable to the jewelry under discussion. Though quartz can be made and is made into the most tasty and varied ornaments, yet the demand for them by our own people is very slight. Some few instances have been quoted of a miner who, liking to recall to his memory the remembrances of his hard-working days when he toiled in the mountains, buys for himself and his female relatives large quantities of this jewelry, but these instances are very few and are daily growing less. With Eastern tourists and English wanderers who are "doing" the country the sale is large, and as a class they are remarkably appreciative of the work bestowed upon this industry. It is true that in most cases it is bought as a souvenir of their stay in California—that is, when those articles are purchased which are more properly intended for the use of ladies. But as the jeweler manufactures heads for walking-canes and elaborate snuff-boxes, it may be confidently expected that some of this ware is not destined for the cabinet of curiosities with which so many travelers delight to incumber their reception halls.

Quality and Cost.

Though quartz fit for the art of the jeweler is found all over California, the best is that coming from the mines of Grass Valley. It is not often that a miner comes across rock which would find a sale among the jewelers. The gold has to be evenly distributed and not lumpy, so that after it has passed through the necessary stages which prepare it for setting, the spots and seams of gold are well scattered through the rock. The quartz which the miner thus procures is sent down either to a bank or an assay office, and from there the jeweler receives notice that a consignment is ready for auction. The bids then depend entirely upon the state of the stock held by the different bidders, and should a jeweler happen to be in want of quartz, the amount paid would perhaps be double that which he would pay upon any other occasion. As a rule, the jeweler pays much higher for rough quartz than would one who desired to purchase solely for the gold to melt. The quartz as taken by the jeweler is brought in lumps weighing from one to ten pounds, and in this condition it is handed over to a mechanic for the purpose of being cut into slabs. The process is an easy one, and is nearly similar to that followed by the marble cutters. The saw by which this operation is performed is circular, and is made of sheet tin and charged with water and emery. The quartz is held up to it, and in its revolutions it divides the quartz. The slabs into which the rock is cut do not generally exceed one-eighth of an inch in thickness. The preliminary work is then over. It is not till the jewelry is made—the fittings, as it were—that these slabs are again cut, then fitted into the gold and cemented. It is then ground off level with the gold, and finally polished till it assumes that brightness as when exposed for sale.

Coloring and Imitation.

The coloring of quartz is extremely rich and varied, being found in the same section of country in white and black and pink and blue. Hitherto there has been no preference expressed by the buyer for the color of the quartz in the trinket. Perhaps this has been obviated by the jeweler, who, in the manufacture of even the smallest article, never fails to give as varied an assortment of quartz as is possible. The method of the valuation of quartz rock is peculiar. It is first weighed as any other matter and then under water, as rock weighs next to nothing when under water surface. The amount of gold imbedded in the rock can by this process be determined. There have not been wanting men who have attempted to make an artificial quartz to be used in the manufacture of large goods, in the way of card-tables and similar articles, but decided failure has followed each and every undertaking. Whether quartz jewelry will ever become fashionable is a question which the business men of this city give no long thought. They declare their inability to use quartz fantastically, or to sufficiently fine it down so as to cut it into delicate flowers or leaves. There is an air of substantiability about all the trinkets made for ladies, which, though handsome, have somewhat of a clumsy look. And then the jeweler has to contend against a difficulty which lies on the opposite side. Quartz cannot be had in sufficiently large pieces to use in the manufacture of objects of use and ornament. Some years ago a jewel casket was made in this city for the wife of a certain rich judge, which in itself was a marvel of beauty and excellence of design, it being of solid gold and quartz, having four panels, each one five inches in length and three inches in width. The cost incurred in this work was enormous and the amount of labor incredible. Some slight estimate of the trouble may be formed when the maker of the casket had to employ a man who traveled for two entire months through the different mines in search for quartz of sufficient size to execute the order.

It cannot be exactly said that there exists no demand for this jewelry outside California, for orders have been filled for people in Chicago and Salt Lake, and it is considered that the demand for this in the northern territory induced one or two jewelers in Portland to undertake its manufacture. After diligent inquiry among several workers it was estimated that not over $150,000 worth of quartz jewelry is disposed of in this city during a year and not $25,000 worth is bought by the people to wear in San Francisco.

The New Orleans Exposition.

We have had much to say of the preparations being made to make a display of the natural resources and productions of California at the New Orleans world's fair, but we have hardly found time hitherto to give a comprehensive sketch of the exposition itself, its facilities and prospects. As this is the fair season, and our readers' minds will naturally turn to information of this kind, we deem it timely to sketch the great coming event in New Orleans, our new neighbor on the southeast. The Exposition will open in December and continue until May following:

The first record of cotton as an industrial product for export in this country is the account of the shipment of six bags (about one bale) from the port of Charlestou, S. C., in 1784, to England. In one century the export has increased four million fold and the production to seven million bales, and to a value as an export in excess of any known product. The National Cotton Planters' Association, at its annual meeting in October, 1882, by resolution, suggested the propriety and policy of celebrating by a special cotton exposition the centennial of that now leading and greatest product of southern industry. The outcome of that resolution is the World's Industrial and Cotton Centennial Exposition. The publicity and agitation of the project developed such wide-spread and spontaneous interest, and met with such a popular and enthusiastic response, that its scope was immediately enlarged and made to cover all products and subjects capable of being brought within the purview of a complete, comprehensive and exhaustive exposition. By the foresight and sagacity of its projectors, through an act of Congress it was given an international character, and virtually placed under the auspices of the general government; Under this act the Board of Management and Commissioners for all the different States and Territories were appointed by the President, and official invitations were extended to the governments and people of all the countries and nations in the world to be represented and participate in the exposition.

The objects of the exposition, as can easily be seen, have become manifold. Primarily, to illustrate the wonderful development in production, manufactures, uses and consumption of that greatest of southern industrial products, cotton, its scope was enlarged to cover all other products of the soil and mine, thus to disseminate among the people of all sections and nations throughout the world a knowledge of the resources, products and industrial and manufacing possibilities of the southern and southwestern States. Then, by embodying in its project, not only the products of the soil and mine of this country but of all the countries of the earth, not only the illimitable issues of nature but the myriad handiwork of man's ingenuity and skill, to make it the exposition of the age. Secondarily, by this grand interchange of experiences, this comparison of products, this generous rivalry of manufactures, to pave the way to the establishment of intimate trade reations with vast territories, so that the Crescent City, commanding the gateway to the grandest system of internal water transportation on earth, and possessing a harbor affording secure anchorage and safe access to the merchant marine of the world, can be the medium for the exchange of the products and manufactures of the great West, North and South, for the rich ores, choice fruits and unique and valued productions of Mexico, the West Indies, Central and South America.

A world's exposition where everything that is evolved by nature and wrought by man can be seen voluminously presented, artistically and attractively garnished, with magnificent and abundant housing, with all possible adjuncts of exhibits and display, cannot fail to pique curiosity and secure gratification. An exposition held at the most unique and attractive city on the continent—a city clothed in perennial verdure, with a mild and genial climate, at a season when elsewhere nature assumes her most rugged and forbidding aspect —will certainly draw by this token many, many thousands. When every line of transportation, readily and heartily recognizing its widely pervading influence in promoting general prosperits, its surprising utility in developing and extending trade relations, decreases its rates to a minimum, it cannot fail to move multitudes.

The World's Industrial and Cotton Centennial Exposition is held under the auspices of the United States government, the National Cotton Planters' Association and the city of New Orleans. The general government has appropriated $1,300,000 for its purpose, the citizens of New Orleans have contributed $500,000, the city of New Orleans has appropriated $100,000, the State of Lonisiana $100,000, and various other States, with large numbers of counties, cities and towns, have appropriated amounts varying from $500 up to $25,000, for the purpose of having their exhibits prepared and made at the exposition, while of foreign countries Mexico leads with an appropriation of $200,000, while many other appropriate amounts from $5,000 upwards.

The city park, a beautiful tract of high and dry land, covered with fine groves of the majestic live oak, lying between St. Charles avenue and the left bank of the Mississippi river, has been assigned by the city council for the uses of the expositon. The city park is in the garden district of the Cresent City and possesses unusually superior advantages for prompt and comfortable access. Five street car lines and two steam car lines reach it from the center of the city, while by water the navies of the world can reach its very threshold.

The main building (now about completed) is the largest building ever erected. It covers, under one continuous roof, thirty-three acres of space. It is 1,386 feet long and 905 feet wide, or one-fourth by one-sixth mile in dimensions. The government building, to contain the United States Government and State exhibits, will be of itself one of the largest exposition buildings ever erected, being 885 feet by 565 feet. The horticultural hall is likewise the largest horticultural building ever erected, being 600 feet in length by 190 in width, with a tower 105 feet in hight. It will contain, without a doubt, the most magnificent floral and horticultural display ever grouped. The resources of the most beautiful gardens of this continent are being utilized to this end—Mexico, the Central American States, and the various tropical islands and countries, are absorbed in generous, but eager rivalry, in making the issue the completest, grandest display of the age. The art gallery and numerous other buildings will be in keeping with the magnitude of the exposition.

The prospects of no other exposition were ever before so brilliant. The applications for space at no other exposition, up to similar period, have been so great in number, so varied in subject, so large in space required.

The results flowing from the World's Exposition cannot fail to be most salutary and to exert a widely beneficent influence over the whole country. The diffusion of knowledge, the interchange of valued experience, the exhibition of the highest skill, the consentration of the best results of ages, the comingling of the people from all climes will leave impressions, the influence of which will be felt for generations.

Mining Laws of New Mexico.

The following is the territorial law in relation to mining claims in New Mexico:

Be it enacted by the Legislative Assembly of the Territory of New Mexico:

SEC. 1. That on and after the first day of April, 1884, in addition to the present requirements of law in regard to the location of mining claims, the locator of a mining claim shall within ninety days from the date of taking possession of the same, and previous to placing the same upon record in the county clerk's office, shall sink a discovery shaft upon such claim to the depth of at least ten feet from the lower part or rim of such shaft at the surface; or shall drive a tunnel, open cut or adit upon such claim exposing mineral in face at least ten feet below the surface.

SEC. 2. All laws or parts of laws in conflict with this act are hereby repealed.

TRANSPORTATION OF MINING MACHINERY.—The cost of moving the Mammoth 40-stamp quartz mill from the old camp to Aurora will exceed $12,000. The mill is said to be complete and the transportation of the same to Mammoth City, its present site, cost about $150,000. The expense of bringing the Bulwer-Standard mill into Bodie was $90,000, so it will be seen that although one may feel convinced of untold wealth in a mine it takes confidence and nerve to even ship the necessary machinery into the country for working. The shipment of the Mammoth mill to Aurora will be significant of the faith in the old camp and its prosperity in the near future. Superintendent Holt accompanied Penter's teamster in the examination of the condition of the road to approximate the cost of transportation.— *Bodie Free Press.*

CALIFORNIA MACHINERY FOR COLORADO.—Yesterday two cars of machinery for mines at West Cliff, Colorado, passed here. This machinery was made at San Francisco, a fact which shows that mining machinery made on this coast is considered superior in Colorado to that made East.— *Winnemucca Silver State.*

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HAND PIECE FOR DENTAL ENGINES.—Henry S. Grace and Wm. A. L. Miller, S. F. No. 303,723. Dated Aug. 19, 1884. This dental implement consists of a plugger and a boring-tool in a single dental hand-piece, and, in combination therewith, of a mechanism by which either part may be put into operation while the other remains inactive. This invention is a very important one and the internal mechanism is quite ingenious.

TUCKER FOR SEWING MACHINES.—Albert J. Hart, San Francisco, assignor of one-half to John Yule, Oakland. No. 303,511. Dated Aug. 12, 1884. This tucking attachment to sewing machines consists in certain combinations of devises. The object of the invention is to provide a single and effective tucker which shall operate accurately, and receive the goods with the tucked portion always on top in sight, whereby the various adjustments can be readily made.

ADJUSTABLE BEAM-WHEEL.—John W. Stafford, Acampo, San Joaquin county. No. 303,405. Dated Aug. 12, 1884. This adjustable wheel is for the beam of single plows and other agricultural implements on which such wheels are used; and the invention consists in a wheel peculiarly mounted in the lower end of a pivoted lever which is connected with an adjustable rack secured to the beam. By the movement of the lever on its own pivot, acting against the wheel as a fulcrum, the beam is raised or lowered, and by the side adjustment of the rack the wheel is thrown under or to one side of the beam, while by another adjustment the rack may be made to fit different beams.

REAMER.—John C. W. Wilson, East Portland, Or. No. 303,410. Dated Aug. 12, 1884. This invention relates to a new and useful reamer or boring tool for turning work and for boring, and it consists in a stock having a conical point; a tubular casting or hollow nut threaded upon the end of said stock, and having independent radiating studs loosely seated in it, and projecting outwardly. The conical point of the stock enters between the inner ends of the studs within the hollow nuts as said nut is set up and forces them outwardly to bind upon and fix the ring, or other work to be turned. The object of the invention is to provide a simple and effective reamer or boring tool.

ELEVATING APPARATUS.—Ira Bishop, S. F. No. 303,384. Dated Aug. 12, 1884. The special object of this elevating apparatus is to carry sacks or bags of material (such as grain) from a lower plane and deposit them on a higher plane—a result necessary to be accomplished in grain warehouses, when the sacks have to be elevated to the floor above, or to the top of a pile on the same floor. This invention is an improvement on a similar piece of mechanism previously patented by the same inventor. The invention consists in an endless chain belt or carrier having peculiar sack hooks or rests, and operated by means of a suitable driving mechanism upon a portable frame, to which are attached, top and bottom, adjustable receiving and discharging aprons.

SAFETY CAR-TRUCK.—Jeanty Denechand, S. F. No. 303,713. Dated Aug. 19, 1884. The invention relates to a new and simple safety car-truck of that class in which a suitable arm or arms are mounted under the car and are adapted to be moved by suitable mechanism in such a manner as to insert guard-rollers, which are mounted in their ends into the grooves in the rails, or to withdraw them therefrom. It consists in a single rigid arched arm carrying rollers in its ends and mounted under the truck and in suitable mechanism by which said arm is lowered and raised to extend transversely and insert its rollers in the grooves of the rails, and by which it is turned again to withdraw its rollers, and is raised to a position parallel with and above the level of the rails. The object is to prevent the de-railment of the car.

STAIRS FOR BUILDINGS.—Peter H. Jackson, S. F., No. 302,339. Dated July 22, 1884. This invention is specially applicable on stairs, on which the treads and risers are made of iron, either plain or with openings of glass for illuminating. It consists of risers, so constructed as to form deep vertical beams, supported at the ends only, of treads, extending from the top of one riser to the foot of the next, with means for securing two together, to resist the tendency of the riser to turn under heavy loads, a means for supporting the central portion of the treads and risers, and in certain details of construction. In the construction of building-, especially where the basements and basement extensions are used for business purposes, when stairs pass up over the front of the basement it is necessary to so construct the stairs as to leave the greatest amount of space beneath them, so that, when desired, illuminating tiles may be set into the stairs to furnish light to the basement with the least possible obstruction. In order to do this, it is necessary to build such without any support or beams underneath. This is the object of the present invention.

MECHANICAL PROGRESS.

Stiffness in Shafting.

It is a common error among builders and users of machinery, both heavy and light, to suppose that because shaft bearings and similar parts appear to be rigid, and to be properly held to place, that therefore they really are thus kept and held. An amount of bending or yielding which is by far too small to be measured, or even detected, by ordinary means will prove in many cases, enough to disturb seriously the supposed working conditions of the parts of a machine, and to lead to heating and cutting which is sometimes persistent and baffling in the extreme.

Probably the chief reason why this is so arises from the fact that, by the springing or slight yielding of the foundation of the pillow-block or hanger in which a shaft may be held, the pressure due to the work transmitted is thrown upon quite a small part of the surface upon which it was intended to be borne, so that the chance is greatly multiplied that the lubricating material will be pressed out from between the surfaces, and that the co-efficient of friction will be thus increased to a degree entirely beyond a safe limit, if indeed the surfaces, becoming dry, do not cut and badly tear each other.

Obviously the first thing done when a bearing begins to heat, is to put on more lubricating material, although care is not always taken to see that it goes where it is needed, or that it is a right kind. The change in the condition of the parts is in the wrong direction in both the particulars upon which the proper running of the whole depends, viz: the co-efficient of friction and the pressure between the surfaces, the pressure being increased by the springing of the parts, and the ratio of the friction being increased by the tendency to crowd out the oil or tallow used.

If it were clearly understood that mere flexibility in machinery, as the term is often used, does not necessarily mean a correct ease of motion, there would be a good deal gained in the interest of economy and of efficiency although these two words mean very much the same thing. It is customary to speak of the "limbering" up of a machine by or during the first few days that it is run, but this word may have two very different meanings. One is, that until all the moving parts have become thoroughly oiled and polished, as they only can be by actual working, they should be held in place loosely, all the binding bolts and adjusting screws being left slack for the purpose. The other meaning, often very incorrect or injudicious in its application, implies that little or no exact workmanship need be used in the fitting or erection of the machinery so long as things are left loose to "find their bearings," as the term is, the misfortune really being that most things, when thus left to themselves, are likely to move out of correct adjustment as well as to remain in it, the usual result of any actual working being to cause a loss of accuracy from the first. Hence the bearings usually "found" by such slackened machinery are not the ones in which the parts should remain, whether they were correct in the first place or not. Nothing can possibly take the place of solid, unyielding foundations for securing permanent economy in the working of any machinery, and no "limbering up" can serve any useful purpose unless this slackening be at the same time accompanied by the closest watching to guard against a loss of accurate level or lining. This is the more important when light shafting or kindred parts are involved, for, as a rule, the lighter the shafting the greater is the proportion of the total power of the engine which is consumed in driving it, as compared with the more massive machinery in the larger mills.

A NEW BLOWING LAMP.—An English firm is now introducing a new blowing lamp for blowing joints, burning off paint and loosening metallic joints when set with corrosion, and more especially for putting india-rubber tires on bicycles and tricycles. The novel part of the lamp consists of a cylinder with two pipes, one telescoped over the other. One of these pipes—about one and three-fourths inches long—is attached to the top of the cylinder, and has a very fine jet formed upon its upper end. The other and longer tube, which slips closely over the fixed pipe, has two lateral openings, through which a proper admixture of air with the gas takes place, so as to obtain a pure blue flame, and around the bottom end of this pipe a small saucer is formed to hold spirit for starting the flame. When in use the cylinder is filled with pure benzine, and then the saucer nearly filled with methylated spirit. When this is ignited, sufficient heat is conveyed to the cylinder to cause a stream of spiritous vapor to issue from the orifice with considerable energy, when it at once becomes ignited by the flame from the methylated spirit in the saucer, and can be applied as desired. The lamp is claimed to be much safer than the French blowing lamp, as, unless the aperture for the escape of the vapor is open, there is no heat by which fresh vapor can be generated, and an explosion from this cause is therefore impossible.

A NEW STEEL MAKING PROCESS.—One of the latest modifications of the Bessemer process for making steel is that of Mr. Alfred Davy, of Sheffield, Eng., and it is likely to prove of great value. The invention consists in employing, with a portable vessel, stand pipes adapted to discharge air into the metal in the vessel beneath the surface by pipes dipping in from above, thus enabling cast-iron founders to make steel and steel castings without the costly plant now provided for this purpose. Mr. Davy claims that his apparatus will enable every iron founder to produce large or small quantities of steel for castings or other purposes at about the cost of cast-iron, and of a quality superior to most crucible steel used for castings. It is claimed, also, that steel may be produced by this apparatus of any temper or quality, except, perhaps, the highest quality of tool-steel, in large or small ingots, at $20 or $22 per ton. The cost of the apparatus is small as compared with the Bessemer plant, and its working is so simple that it can be managed by any ordinarily intelligent workman. Three or four plants for the manufacture of steel by this method have been ordered for this country, and in Sheffield no less than 24 sets of plants are being removed to make way for Mr. Davy's apparatus. The amount of Bessemer steel produced in the United Kingdom in 1878 was 807,527 tons, but in 1883 the production amounted to 1,553,330 tons. The Davy apparatus has already been described in a previous issue of this paper. *W. Manufacturer.*

DRESSING MILL PICKS.—A correspondent of the *Blacksmith and Wheelwright*, writes that journal in regard to the manufacture and dressing of the mill pick as follows: "I will say first that they should be made of double refined cast-steel made expressly for this purpose. In drawing out, use a smooth face hammer, and be careful not to heat the steel higher than a dark cherry red. Do not strike the pick on the edge when finishing it, but hammer on the flat side, striking light and often, until the steel is quite dark. Let the blows fall so as to close up the pores of the steel. When a dozen picks are ready to temper get one pound of the best concentrated lye, which will cost only a dime in any store. Dissolve it in a bucketful (a common water bucket) of soft rain water, then heat the point of the pick to a cherry red dip the point vertically into the bath and hold it still. When the heat has left the parts immersed take it out, draw to a light straw color and cool in a tub of clear water. Be sure to have the lye well dissolved and stirred up before tempering. Also be sure to heat and hammer well. Follow these directions and you will find no trouble in making picks stand on the hardest French buhrs."

THE COMING BOILER.—An exchange says: "The coming boiler will be made of steel, and iron will be the exception, as it is now on all first class railroad lines. After twenty-five years of experiment, a discovery has been made which brings the working of any grade of steel within perfect control. By the Bessemer desulphurizing process steel of an extraordinary degree of softness can be obtained with the greatest facility at a cost that is less than is paid for ordinary steel rails. Till now the high price of soft steel has been the great obstacle which has prevented many people from using it in construction. But, by the new process, soft metal can be produced at a less price than ordinary puddled iron. There is, therefore, no longer any reason why steel should not be everywhere employed in place of iron, to which it is so much superior in strength. Indeed, 200,000 tons of steel were made yearly in England, and 500,000 on the continent, according to the reports, and by this time it is quite likely the capacity is doubled. *-Ex.*

SODIUM BRONZE, A NEW ALLOY.—Q. L. Weiller, Angouleme, France, has patented in England, France, America and Italy a new alloy for making silicious copper and bronze. The alloy is claimed to be particularly suited for electric conducting wire, and also for making guns and machinery. A mixture of sodium and tin is first made, after which copper is added to form what the inventor calls "sodium bronze." When a larger amount of sodium is required than can be conveniently combined with the tin to be employed in the alloy, sodium in an uncombined state can be used in conjunction with the sodium-tin or sodium-bronze, the product being introduced with fluosilicate of potash into the melted copper or bronze.

PROGRESS OF AGRICULTURAL MACHINERY.—The inventors and makers of agricultural machinery have devoted so much ingenuity upon their work that it is hard to conceive any ordinary operation in farming that is not facilitated by some labor-saving machine. From the time that wheat goes into the ground till the time it reaches the table in the form of bread, nearly every separate process has been done by machinery. We know of no field of mechanical enterprise where labor-saving appliances are receiving the same attention at present as they are in agricultural machinery establishments.

A VALUABLE BUILDING STONE.—A peculiar kind of building stone is found in some localities in Oregon, which, it is said, possesses the property of being uninjured by the action of cold, heat and moisture. It is called granite sandstone, is very rich in silica, of a close, fine grain, highly crystallized, unlaminated and of a fine brown color. On being brought to a white heat, and suddenly plunged in cold water, it comes out as solid and firm as at first.

SCIENTIFIC PROGRESS.

Progress of Chemistry.

At the recent Montreal meeting of the British Association for the Advancement of Science, Prof. Henry Enfield Roscoe, President of the chemical section, made an address in which he reviewed the progress of the science between 1848 and 1884. The first date is that of the death Berzelius. The second that of Dumas, the chemist. The differences between what the speaker called the Berzelain era and that with which the name of Dumas will be associated show themselves, he said, in many ways, but in none more markedly than by the distinct views entertained as to the nature of a chemical compound. According to the older notions, the properties of compounds are essentially governed by the qualitative nature of their constituent atoms, which were supposed to be so arranged as to form a binary system. Under the new ideas, on the other hand, it is mainly the number and arrangement of the atoms within the molecule which regulate the characteristics of the compound, which is to be looked on not as built up of two constituent groups of atoms, but as forming one group. After discussing valency or the doctrine of atomicity the speaker took up that interesting phase of organic chemistry known as orientation.

This brings up the question: Given certain compounds which possess the same composition and molecular formulæ, but varying properties, to find the difference in molecular structure by which such variation of properties is determined. Problems of this kind can now be solved satisfactorily, the number of possible isomera forctold, and this prediction verified by experiment. The general method adopted in such an experimental inquiry into the molecular arrangement of chemical constitution of a given compound, is either to build up the structure from less complicated ones of known constitution, or to resolve it into such component parts. In connection with this matter Prof. Roscoe remarked: "The discovery of aniline colors by Perkin, their elaboration by Hoffman, the synthesis of alizarin by Graebe and Liebrmann, being the first vegetable coloring matter which has been artificially obtained, the artificial production of indigo by Baeyer, and, lastly, the preparation by Fischer of kairinc—a febrifuge as potent as quinine—are some of the well-known recent triumphs of modern synthetical chemistry. And these triumphs, let us remember, have not been obtained by any such 'random haphazarding' as yielded results in Priestly's time. In the virgin soil of a century ago the ground only required to be scratched and the seed thrown in to yield a fruitful crop. Now the surface soil has long been exhausted, and the successful cultivator can only obtain results by a deep and thorough preparation, and by a systematic and scientific treatment of his material."

GASES IN STEEL—Brastlein concludes, from a great number of observations, that iron and steel can be alloyed with nascent hydrogen at ordinary temperatures; but at a red heat this alloy is broken up, and that at the melting temperature of steel it may again be alloyed with hydrogen with more or less energy.

Will North America Become a Desert?

This is a startling query which has been suggested by a recent writer in the *North American Review*. The source of the threatened danger is expected from the gradual change wrought in our climate by the diminution of rain-fall, caused by the denudation of forests and other matters following in the train of advancing civilization. By reason of extensive land cultivation and forest destruction the rivers are slowly drying up, and extended droughts are much more frequent than formerly, while the winter snows and spring rains are carried away more rapidly than formerly.

Some notable statements are presented in support of these assertions. In various sections of the country where perennial springs were once numerous they are now rare; in localities where crops were once easily raised they are now seriously interfered with by drought; rivers which once furnished an abundance of mill power now often fail to turn the wheels for lack of water.

The ultimate issue is foreshadowed from the experience of the old world. Historians of antiquity describe what are now great barren regions in Asia Minor and Northern Africa as in their time teeming with verdure. Babylonia was once a delightful country. It is now almost a desert. The temperature is also changing from the same causes in many localities. Notable changes are observed in Babylonia, Northern Greece and Italy, Germany and Spain. All these changes have been wrought by the hand of man in the progress of civilization. The same causes are now at work in regions where the advent of civilization has a later date, and these appear to be full enough of probability that the same changes will occur on this continent unless science steps in to show how to avoid it, and legislation comes to her aid to compel a course of improvement which will prevent such undesirable changes in the face of nature.

BALLOON PHOTOGRAPHY.—Major Eleslade has lately made some interesting experiments upon balloon photography for military purposes. He launched at Chatham captive balloons provided with automatic photographic chambers. After the balloon reached a certain hight the plate was exposed and a negative taken. The experiments are said to have succeeded perfectly, and in one of the small proofs obtained in this way the number of soldiers placed at a great distance could be ascertained by counting, with the aid of a magnifying glass, the little white spots which were made by the helmets of the infantry. *-Nature.*

OBSERVATIONS ON THE STAR ARCTURUS.—The astronomers at the Greenwich observatory have been making calculations as to the speed of the star Arcturus in his progress toward the earth. They find, as the result of 21 observations, that this beautiful, scintillating star is moving toward this planet at the rate of 50 miles per second. This amounts to about 3,000 miles a minute, or 180,000 miles an hour. But, even if this hot rate of speed should be continued, Arcturus is not likely to shatter our little globe for the next 93,000 years, although his brightness is likely to grow in the sight of remote posterity. A scientist, writing on this subject, says that an 81-ton gun will drive forth its projectile with a maximum velocity of 1,400 feet per second, and that Arcturus is approaching us at a speed 200 times greater. But, as the earth's distance from this lively star at the last measurement was estimated at 1,622,000 times greater than that between it and the sun, this generation and untold generations to follow may pursue the even tenor of their way undisturbed.

ORIGIN OF VOLCANIC ACTIVITY.—Few persons doubt at the present day, that the elastic force of steam is the true motor of volcanic eruptions and earthquakes. The ocean is the source of the water which reascends to the surface through volcanic crevices. Since the pressure developed at great depths is the cause of the eruptions, it is obvious that the water can not penetrate through cavities of sensible dimensions. Stanislas Meunier in speculating upon this matter, supposes three successive layers of rocks, under the ocean bed; the first of rocks impregnated with water, the second of rocks consolidated without the impregnation of water, and the third of rocks in which the temperature is sufficient both to vaporize and to dissociate the vapor of water. The water penetrates farther and farther into the deep rocks in consequence of the secular cooling of the globe, and the rupture of portions of the earth's crust by the contraction of the internal nucleus admits the water of the superficial layers into regions in which the vaporization and dissociation suddenly takes place.—*Nature.*

UTILIZING CORN HUSKS.—The husks of maize or Indian corn, after the grain has been extracted, usually serve only for manure, or, in some cases, as fuel for portable engines for agricultural purposes. But they contain starch, alhumen, and other substances capable of being turned to account, and even afford an alcohol which is at least equal to potato spirit, leaving a pulp suitable for the food of various animals. Herr Holl, of Worms, has invented a process for utilizing these husks, by which he exposes the husks for an hour or an hour and a half to the action of steam at a pressure of 35 to 45 pounds per square inch, in order to reduce them to powder, and thus open the starch cells, when distillation is proceeded with in the ordinary manner.

MEETING OF THE BRITISH ASSOCIATION, MONTREAL.—It is now 53 years since the British Association for the Advancement of Science was formed, principally through the efforts of Sir David Brewster, Sir Humphry Davy, Sir John Herschel, and other leading scientists. The main feature of the association is its annual gatherings, at which members who suppose they have made a real advance in science read their papers for the criticism of others engaged in similar lines of scientific work; reports are also made upon particular departments, their progress and needs, and as a guide to further inquiry. This year, however, affords the first instance of the meeting of the association outside of the British Isles.

ATMOSPHERIC ELECTRICITY AND THE WEATHER.—The Providence *Journal* states that the recent experiments undertaken at Harvard College to test the value of electrical changes in the atmosphere as indications of coming weather changes have been very promising. Though the observations are not yet full enough to justify decided statements, "coming changes in the direction of the wind, rainy weather and coming storms," it says, "are foretold by the apparatus." The apparatus employed, which is substantially that devised by Sir William Thomson, with some adjustments, photographs every change in the electricity of the air, and also indicates the degree of change.

EFFECT OF ZINC ON WATER. In Guy's Hospital Report, Dr. Stevenson alludes to a generally accepted opinion, that water stored in zinc or zinc coated tanks is not affected by the zinc to any appreciable extent, and states that he has abundant evidence that water does, under certain conditions, act energetically upon zinc and galvinized iron. He mentions a case in which rain water passing from a reservoir through galvanized pipes was for many weeks turbid and milky in appearance, and contained a notable quantity of zinc in suspension, and some in solution. Dr. Stevenson's experience is also confirmed by that of other writers.

MINING AND SCIENTIFIC PRESS.

Passing Events.

Mining matters are exceedingly quiet just now. The approach of winter has brought in the prospectors from the more mountainous regions, where, in some places, snow has already fallen.

Judging from the late Montana papers, the reports as to the richness of the new Little Rocky mines, seem to be confirmed. Hundreds of men have gone to the new diggings from the towns about the region, and some of the first on are said to be getting handsome pay. Both placer and quartz are found, the gulch in which the placers have been discovered being quite extensive.

Arizona announces a Territorial Industrial Exposition, which is but another proof of her advancement.

The State fair at Sacramento is in full blast and is largely attended.

A SPECIAL from Cincinnati says: The discovery of tin in West Virginia is attracting much attention. When first found it was supposed to be silver. It is estimated that the veins are sufficiently extensive to supply a dozen furnaces for hundreds of years. The owners of the land expect to begin operations on a large scale. This is the first tin discovered on the Atlantic coast.

An Exhibition of Inventions.

An international exhibition will be opened next May, at the buildings in South Kensington, which will be devoted to apparatus, appliances, processes and products, invented or brought into use since 1862. The collection of inventions will, it is hoped, serve to bring vividly before the public the progress which has been made during the last quarter of a century, in applying the discoveries of science to the purposes of daily life. For the practical realization of this idea, it will be desirable not only to exhibit the apparatus by which a process is carried out (or a model or diagram of it), side by side with the resulting product, but also to show the working of, at all events, a limited number of industrial processes in their consecutive stages. Having in view the wide range of this international exhibition, and the limited nature of the total available area, it will be necessary to restrict as much as possible the amount of space which can be allotted even to the most important classes. It will be preferable that inventions generally should (as far as practicable) be illustrated by models, which, in the case of an entire machine, may be accompanied by actual examples of the parts improved. Where the invention relates to parts only of a machine, the whole machine will not be admitted unless the improvement (in respect of which the machine is offered for exhibition) cannot be sufficiently well shown without the exhibition of the entire apparatus, or unless in the opinion of the executive council the exhibit is of such special interest as to render its admission desirable. As the exhibition will be limited to the illustration of industrial processes, examples of either the raw materials employed, or the finished products will only be admitted when they are required for the full demonstration of a particular process. Applications for space from this county will be received up to November 1st.

Here is an opportunity for American inventors to show their inventions in the most thickly settled portion of the world, and to an appreciative multitude. There are very many of our processes, products and appliances, not now known abroad, which could be successfully introduced through the medium of this international exhibition. Our American inventors should be up and doing in this direction. It will be well for them to patent their inventions in England before exhibiting them, if they have not already done so. But, at all events, our inventors should take steps to be properly represented. The classification is as follows: Apparatus, Appliances, Processes and Products invented or brought into use since 1862.—Agriculture, horticulture and arboriculture; mining and metallurgy; engineering construction and architecture; prime movers and means of distributing their power; railway plant; common road carriages, etc.; naval architecture; aeronautics; manufacture of textile fabrics; machine tools and machinery; hydraulic machines, presses, machines for raising heavy weights, weighing, etc.; elements of machines; electricity; apparatus, processes and appliances connected with applied chemistry and physics; gas and other illuminants; fuel, furnaces, etc.; food, cookery and stimulants; clothing; jewelry; leather, etc.; India rubber and gutta percha, etc.; furniture and accessories (fancy goods); pottery and glass; cutlery, ironmongery, etc., fire-arms (military weapons and equipment, explosives); paper, printing, book-binding, stationery, etc.; clocks, watches, and other timekeepers; philosophical instruments and apparatus; photography; educational apparatus; toys, sports, etc.

FOREIGN CORPORATIONS.—In the case of M. O. Thomas vs. The Placerville Gold Quartz ing Mining Company, the Supreme Court has denied the motion for a change of venue from San Francisco to El Dorado county. "A foreign corporation," says the Court, "exists in and by virtue of the law of a foreign country and no statute of this State has ever given a local (county) residence to such a corporation, where alone it can be sued. Its liability to be sued in the Courts of this State no more confers a county residence upon it than does the comity which permits it to apply to our Courts for the enforcement of a contract or the redress of a wrong."

THE Miners' Union of Battle Mountain has elected the following officers: President, Bart Malloy; Vice-president, Arthur Thomas; Secretary, P. H. Boland; Treasurer, E. J. Harris.

Mill Sites.

Section 405 of the U. S. laws provides that "where non-mineral lands not contiguous to the vein or lode is used or occupied by the proprietor of such vein or lode for mining or milling purposes, such non-adjacent surface ground may be embraced in an application for a patent for such vein or lode, and the same may be patented therewith, subject to the same preliminary requirements as to survey and notice as are applicable to veins or lodes; but no location on such land shall exceed five acres, and payment for the same must be made at the same rate as fixed for the superficies of the lode. The owner of a quartz mill or reduction works, not owning a mine in connection therewith, may also receive a patent for his mill site."

To avail themselves of the provisions of this law, parties holding the possessory right to the vein, and to a piece of non-mineral land near by, not exceeding the required quantity, the proprietors of the same may file in the proper land office their application for patent, under oath, which application (with plat and field notes) may embrace the mill site in addition to the lode, and after due proceedings the patent will issue conveying it as one claim.

The Land Office requires that in making a survey in a case of this kind the lode claim should be described in the plat and field notes as ("Lot No. 37 A.), and the mill site as ("Lot No. 37 B"), or whatever may be its proper number; the course and distance from a corner of the mill site to a corner of the lode claim to be invariably given in the plat and field notes, and a copy of the plat and notice of the application must be posted for 60 days on both the mill site and the vein. In making the entry no separate receipt or certificate need be issued for the mill site, but the whole area of both lode and mill site will be embraced in one entry, the price being $5 per acre.

In case the owner of a quartz mill or reduction works is not the owner of a vein, the law permits him to make application in just the same manner as provided for mining claims; and after the notice, in the absence of valid adverse filing, he will receive his patent for the mill site. In every case there must be satisfactory proof that the land claimed as a mill site is non-mineral, which proof may, where the matter is unquestioned, consist of the sworn statement of the claimant, supported by that of one or more disinterested persons, capable, from acquaintance with the land, to testify understandingly. The law expressly limits mill site locations to five acres.

An Arizona Industrial Exhibition.

The Arizona Industrial Exposition Association will open their first fair on November 10th, at Phœnix, Arizona. It will continue six days. Word from all parts of Arizona, from stock and mining men, assure the Association of a great deal of interest in this first fair. The S. P. R. R. offers free transportation from all points in Arizona, and half rates on California and New Mexico exhibits.

This will afford a fine chance for manufacturers in this State to advertise their machinery—farming, fruit, mining and household appliances. Silver and bronze medals and diplomas will be offered as prizes for exhibits. They have a regulation mile-track which is being put in fine condition for racing.

There are many things we make in this State which are used in Arizona. Our merchants and manufacturers who are anxious for the Arizona trade should make an effort to be represented at this fair in some way. Heavy articles, expensive to transport, handle and set up, perhaps it would hardly pay to send so far, although if there is a market for them in this growing Territory they ought to be shown. But there are many things which should be exhibited. No doubt suitable persons could be found on the spot to take charge of exhibits. A good deal of Arizona trade is now done by Los Angeles people which formerly came to this city, and exhibitions such as this furnish one of the means for San Francisco firms to secure their portion of the growing trade.

MR. H. A. BEATON is now visiting Washington Territory in the interests of this and other papers published by Dewey & Co. We shall feel obliged to all who can assist him in any way in obtaining information, and increasing our list of subscribers in the Territory.

A Mining Debris Case.

Patrick Campbell, the former superintendent of the Golden Gate Consolidated Hydraulic Mining Company, situated near Smartsville, Yuba county, appeared in Judge Toohy's Court this week, seeking to secure his release from the custody of the Yuba county officials, on a writ of habeas corpus, he having been committed for contempt of Court by Superior Judge P. M. Keyser. It appears that on February 1, 1883, suit was commenced by the people of Yuba county against the mining company, of which the defendant was superintendent. An injunction was issued by Judge Keyser, restraining the officers, agents, or any of the employes of the mining company from dumping or allowing debris from the mine to run into the Yuba river, or any of its tributaries, and Sucker flat ravines. A summons was duly served on the company on September 15, 1883, and on December 12th of the same year, James Redmond and E. A. Davis appeared in Court before Judge Keyser, and averred that on the first of that month Campbell had worked the mine and allowed the tailings to run into the Yuba river. On January 24, 1884, an order was made citing Campbell to appear in Court on March 3, 1884, to show cause why he should not be punished for contempt in violating and disregarding the injunction. Campbell was in this city at the time and he did not personally appear in Court, but was represented by his attorney. The result of the matter was that Campbell was found guilty of contempt and ordered to pay a fine of $500 or be imprisoned in the Yuba county jail for 500 days. As he did not pay the fine, an order for his arrest was made on the 20th of uly, and he was arrested in this city by Detective Harry N. Morse, to be returned to Yuba.

Campbell's lawyers argued that he should be released on the ground that he was not connected with the company at the time that the injunction was issued, and consequently the restraining order did not apply to him. T. P. Reardon, the former president of the company, testified in support of the motion that Campbell had severed his connection with the company two months previous to the issuing of the injunction, and had not been interested in the mine in any manner since that time. Campbell then corroborated Reardon's testimony, and the matter was taken under advisement until the 8th prox.

The Lick Observatory.

Prof. Holden, of the Washburn Observatory, Madison, Wis., has come to California to set up the repsold meridian circle of the Lick Observatory, Mt. Hamilton. This meridan circle has been made by designs by Prof. Holden with improvements in details suggested by his use of the first one, and is believed to be the first instrument of its kind in the world. The objective is six miles in diameter with No. 5 collimeters of the same aperture. The circles are graduated to two minutes and the errors of graduation are less than half a second.

The instrument will be placed on the northeast angle of the plateau of Mt. Hamilton, from the summit of which 40,000 tons of material were removed.

A large amount of the preliminary work at Mt. Hamilton has been completed, under the personal supervision of Thos. E. Fraser, superintendent of construction of the Lick Observatory. Steady work is being carried on in preparation for the great telescope. Bad luck in casting the glasses has delayed the completion of the instrument, but the Lick Trustees will eventually furnish one of the finest observatories in the world. The location is a most excellent one, the atmosphere being generally clear at the point selected, and little trouble is anticipated from coast fogs. Numbers of visitors go to Mt. Hamilton now to inspect the buildings and site.

MONTANA ASSAYERS.—The developing mineral resources of Montana at Butte City are causing much work for assayers, and some thorough and competent workmen in this line are to be found about the laboratories of the smelting works and mines of that place. Hubbard, Breen & Meade have a chemical laboratory and assay office in town, where they recently showed our agent many interesting processes and results. The ores at Butte in many instances carry so many metals that a very thorough assay is necessary to determine their value. It is well that there are places where the prospector and miner can learn these values right at home.

The Hotchkiss Mechanical Boiler Cleaner.

The engravings herewith illustrate the Hotchkiss mechanical boiler cleaner, for removing sediment or mud from steam boilers. Fig. 1. shows the cleaner as applied to ordinary boilers; Fig. 2. shows it in all parts. Referring to Fig. 2. A A is the top of the boiler upon which reservoir B rests; this reservoir is connected with funnel C by up-flow pipe D, and to the lower part of the water by return pipe E. The funnel C is set within the boiler on low water line O O. G, is a diaphragm in the reservoir, to divert the flow of the water therein. The spot shown at the top of the diaphragm in the reservoir is an airhole, and must not be plugged. F is the blow-off pipe for removing deposits in the reservoir. H H are two valves to shut off the reservoir from the boiler in case it is desired. I is the valve in the blow-off pipe F. K, socket nipple with thumb screw to make joint between funnel and up-flow pipe. M and N, nipples with half union to make joints with valves H H. Pipes and fitting are one and one-half inch, except the blow-off pipe, for which one inch pipe and fittings are used. The blow-off pipe can be carried to any desired place as occasion requires, but the valve should not be placed on top of the boiler, but in the handiest place possible; this, in order that it may be used without inconvenience.

The manner in which the cleaner acts in removing sediments and preventing scale formation is as follows: As soon as the water in the boiler becomes heated, currents are established, formed by the hotter and therefore lighter water flowing upward and away from the source of heat, while the colder, more dense water flows towards the source of heat to replace the other, in its turn to become heated. This action is constant and certain. These currents carry to the surface of the water sediments held in suspension. The sediments that are held in solution are separated from the water at the point at which steam is formed, viz., the surface of the water. Thus sediment held in suspension and in solution collects on the surface of the water. In a boiler with the cleaner attached, the funnel is set at a point furthest from the fire, near the surface of the water, but partly submerged, and in such a position that its opening will intercept the currents of hot water flowing toward it. By the action of gravity in waters of varying temperatues, aided by the pressure of steam on the surface, the hot surface water that enters the funnel is forced into the reservoir through the up-flow pipe, displacing an equal quantity of cooler water therein, which flowing back by the return pipe, reaches the lower and cooler strata of water than that entering the funnel. Thus a constant and steady circulation of water through the cleaner is maintained so long as firing is kept up. This circulation is continuous and automatic, and by a certain and natural action all the water in the boiler passes successively through the reservoir, where being kept from the agitating currents in the boiler, the most favorable conditions are insured for deposit of sediments.

Sediments are removed from the reservoir through the blow-off pipes as often as necessary. Every one familiar with steam boilers is aware that deposits seek naturally the quietest part of the boiler. The object of the Hotchkiss cleaner is simply to provide a place for their accumulation outside of the boiler, removed from the heat and its agitating effects, from whence they can be readily removed as fast as they accumulate without having to shut down the boiler and clean them out, or without blowing down the boiler in the usual way, using a large amount of water already heated to the steaming point, which is wasteful of fuel as well as of water.

It is not claimed that the Hotchkiss cleaner will remove scale already formed bodily, but it is claimed that it will prevent the formation of new scale by removing all the deposits, whether held in suspension or solution, that the water contains, before they can adhere to the heating surface. By preventing new scale from forming, the old scale, by expansion and contraction of the heating surfaces, soon becomes loose, and is easily detached. The cleaner is automatic and certain in its action, and will outwear a new boiler. It requires no attention, care or expense beyond the cost of application. The apparatus requires no attention, acting automatically. It is claimed that it will not only save cost in repairs and fuel in a few months, but will reduce the liability of explosion. Very many of these appliances are in use. In the vicinity of this city the sole agents, Messrs. Cavanaugh & Fredricks, 317 Mission street, will apply it complete for $125. Where parties wish to apply it themselves, the special fittings, including everything except the 1½ inch circulating pipes (D and F), about 8 feet long, and the 1-inch blow-off pipe (F), will be supplied for $100, free on board cars.

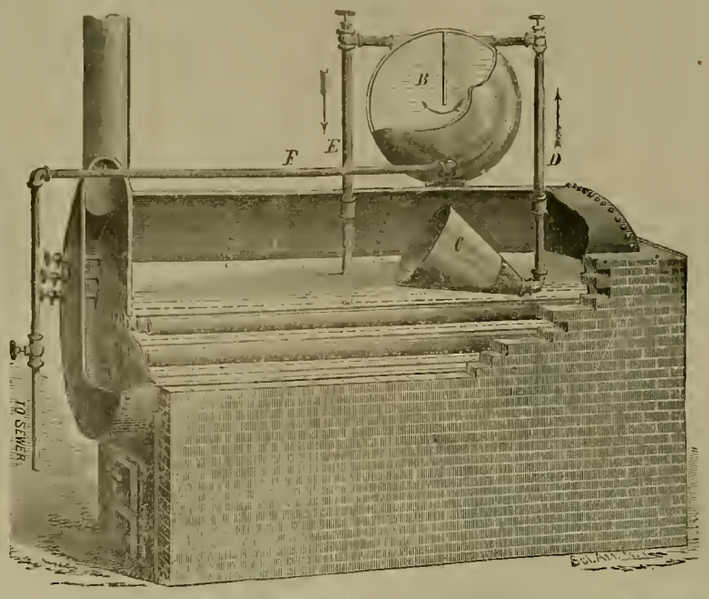

Fig. 1.—THE HOTCHKISS CLEANER AS ATTACHED TO ORDINARY BOILERS.

MINERAL CABINET.—Probably one of the most remarkable cabinets of mineral specimens in Montana, if not the finest private cabinet on the coast, is that belonging to Geo. W. Newkirk, at his place of business, Butte City. He has choice and valuable specimens from all the Territories and States on the coast, including Colorado and also Alaska, as well as rarities in the shape of silver and gold coins, specimens of the handiwork of natives of various tribes, freaks of nature in queer formations, rara avis, etc. The Villard excursion party, which came on to witness the driving of the last spike in the N. P. R. R., took a run down to Butte City, and besieged Mr. Newkirk in a body. They expressed great surprise at his rare collections, as has been done by many a Pacific coast tourist who may take the trouble to look at it. One or two of the gold quartz specimens show how Nature excels as a jeweler when she essays to attain the beautiful. The threads of gold running through the white quartz, and the filagree work where these threads are matted together are the hights of beauty in the combination of stone and metal.

Electricity for Hauling Cars Underground.

On the continent the mining engineers have been quick to perceive the advantage which might be derived from the employment of the electric current for power underground. After numerous experiments, about two years ago the electric system of hauling cars underground was put in service at the Zankeroda mine, in Saxony, and since that time it has been in constant operation. The plane which is worked by electrical haulage is a stone-drift connecting two distant parts of the mine. This drift is about 225 yards from surface, and is 730 yards in length and perfectly straight. Laid out to be worked by steam or by horse-power, it would offer very favorable conditions for economical haulage. It is laid with a double line of rails of 19-inch gauge, one line being set apart for the loaded tubs and the other for the returning empties. The rails are of the Vignoles type, and weigh 14 pounds per yard. The electric haulage is limited to 630 yards, about 50 yards at each end of the drift being left for space to make up the trains. From a mechanical point of view this line has been a complete success from the day it was opened, now more than two years since. Throughout that period of time no hitch has occurred in the working and no skilled attendance has been required.

Mr. George J. Andre, the accomplished writer and mining engineer, in his "Continental Colliery Notes," which he is publishing in the Manchester *Colliery Guardian*, gives some very interesting details of results with other systems, from which we condense some facts.

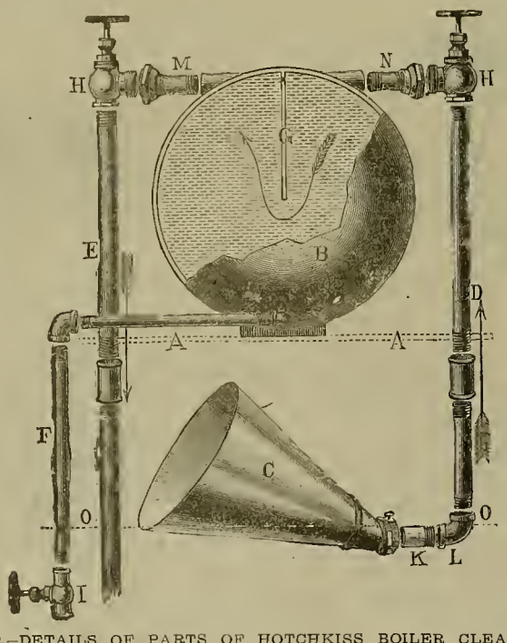

Fig. 2.—DETAILS OF PARTS OF HOTCHKISS BOILER CLEANER.

The engine house at surface in which is the electrical machine is situate about 64 yards from the shaft. The machine is one of the Siemens' construction, and is driven by belting from the engine at a speed of 800 revolutions a minute. This speed is three and a quarter times that of the motor underground. A carefully conducted series of experiments shows that this ratio of the speeds gives the highest efficiency. The current is carried from the machine to the shaft by bare copper wires 6½ millimeters (0.22 in.) in diameter. In the shaft the leading wire, of the same diameter, is covered with gutta-percha, which is protected by a covering of lead, the latter being shielded from injury by a sheathing of galvanized iron wire. The return wire is similar to the leading wire, but is without the iron sheathing. Both are suspended at intervals of ten yards on iron hooks. From these shaft cables the current passes into the rails. The insulation of these rails is merely an absence of metallic connection. But it has been found sufficient under all circumstances. No failure has ever occurred from leakage from one line to the other. The locomotive is also a Siemens' machine, mounted on a suitable carriage symmetrically constructed to run in either direction. The conductor has a seat within easy reach of the starting and stopping levers. The current is taken up from the rails by a kind of brush, which is held in firm contact with the rails by a spring. The locomotive is compactly designed; its extreme length is 6 ft. 10 in., its breadth 2 ft. 3 in., and its hight over all 4 ft. 3 in. Its weight is about 31.4 cwt.

The trains are made up of 15 tubs, having each a capacity of 9 cwt. The locomotive is always attached to the rear end of the train to act by propulsion. The speed is such as to occupy four minutes in the run of 630 yards. This speed has been found to give the highest efficiency, and is consistent with safety. During the two shifts of eight hours each, 660 tub loads are run over the plane. This is the present amount of the output; but the quantity might be increased up to 800 tubs without exceeding the power of the locomotive.

Along the roof of the drift are hung upon insulators two bare copper wires of small diameter, communicating with an electric bell in the engine room at surface. By means of these the conductor can communicate with the engineman at surface from any point along the line by merely pressing the wires into contact. In this way he signals "start," "stop," "faster," "slower," as required. The driver at surface can see by the resistance offered to the generating machine when the locomotive is in motion. When the latter is stopped he shuts down his steam and runs light till the locomotive is again set in motion. The plant cost £800 to put in. The manager of the mine states that the working cost for 660 tubs transported in 16 hours amounts to 12s. 2d., or about 0.21d. per tub. It is estimated that horse-power would cost twice that sum.

Academy of Sciences.

On Monday evening last the regular semi-monthly meeting of the Academy of Sciences was held, President Davidson in the chair. Among the donations was a cast of a fragment of the lower jaw of a mammoth, found at the State Prison quarry, Carson, Nev., where so many mammoth footprints have been discovered. Mr. C. D. Gibbes presented the branch of an india-rubber tree which is growing in the open air in this city. Mr. Gibbes read a memorandum making some suggestions as to the adaptability of the climate and soil of California for the growth of the india-rubber tree, for commercial purposes.

The President read a short paper made up of notes from a letter of Lieutenant Doty, describing the volcano of Bogoslov, in the Behring sea. Lieutenant Doty gave a description of the old island, and also of the new one which rose out of the water two years ago. The old island was also elevated during the same disturbance. A strip of sand beach connects the two islands. The party went up the new volcano as far as practicable, but saw no distinct crater, though there is a great fissure through the center of the island, which emits volumes of steam. The rugged nature of the surface and the numerous fissures prevented a thorough investigation. The old island is now inaccessible, the lower portion of its sides being almost vertical.

DIGGER INDIANS predict an open winter.

The Life History of Vaucheria.

[Read before the San Francisco Microscopical Society, August 13th, by A. H. BRECKENFELD, and furnished for publication in the PRESS.]

Nearly a century ago, Vaucher, the celebrated Genevan botanist, described a fresh water filamentous Alga which he named *Ectosperma geminata*, with a correctness that appears truly remarkable when the imperfect means of observation at his command are taken into consideration. His pupil, De Candolle, who afterwards became so eminent a worker in the same field, when preparing his "Flora of France," in 1805, proposed the name of *Vaucheria* for the genus, in commemoration of the meritorious work of its first investigator. On March 12th, 1826, Unger made the first recorded observation of the formation and liberation of the terminal or non-sexual spores of this plant. Hassall, the able English botanist, made it the subject of extended study while preparing his fine work, entitled "A History of the British Fresh Water Algæ," published in 1845. He has given us a very graphic description of the phenomenon first observed by Unger. In 1856 Pringsheim described the true sexual propagation by oospores, with such minuteness and accuracy, that our knowledge of the plant can scarcely be said to have essentially increased since that time.

Vaucheria has two or three rather doubtful marine species assigned to it by Harvey, but the fresh water forms are by far the more numerous, and it is to some of these I would call your attention for a few moments this evening. The plant grows in densely interwoven tufts, these being of a vivid green color, while the plant is in the actively vegetative condition, changing to a duller tint as it advances to maturity. Its habitat (with the exceptions above noted) is in fresh water—usually in ditches or slowly running streams. I have found it at pretty much all seasons of the year, in the stretch of boggy ground in the Presidio, bordering the road to Fort Point. The filaments attain a length of several inches when fully developed, and are of an average diameter of 1-250 (.004) inch. They branch but sparingly, or not at all, and are characterized by consisting of a single long tube or cell, not divided by septa, as in the case of the great majority of the filamentous Algæ. These tubular filaments are composed of a nearly transparent cellulose wall, including an inner layer thickly studded with bright green granules of chlorophyll. This inner layer is ordinarily not noticeable, but it retracts from the outer envelope when subjected to the action of certain re-agents, or when immersed in a fluid differing in density from water, and it then becomes distinctly visible, as may be seen in the engraving (Fig. 1). The plant grows rapidly, and is endowed with much vitality, for it resists changes of temperature to a remarkable degree. *Vaucheria* affords a choice hunting ground to the microscopist, for its tangled masses are the home of numberless infusoria, rotifers, and the minuter crustacea, while the filaments more advanced in age are usually thickly encrusted with diatoms. Here, too, is a favorite haunt of the beautiful zoophytes, *Hydra viridis* and *H. vulgaris*, whose delicate tentacles may be seen gracefully waving in nearly every gathering.

Reproduction in Vaucheria.

After the plant has attained a certain stage in its growth, if it be attentively watched, a marked change will be observed near the ends of the filaments. The chlorophyll appears to assume a darker hue, and the granules become more densely crowded. This appearance increases until the extremity of the tube appears almost swollen. Soon the densely congregated granules at the extreme end will be seen to separate from the endochrome of the filament, a clear space sometimes, but not always, marking the point of division. Here a septum or membrane appears, thus forming a cell whose length is about three or four times its width, and whose walls completely inclose the dark-green mass of crowded grannles (Fig. 1, *b*). These contents are now gradually forming themselves into the spore or "gonidium," as Carpenter calls it, in distinction from the true sexual spores, which he terms "oospores." At the extreme end of the filament (which is obtusely conical in shape) the chlorophyll grains retract from the old cellulose wall, leaving a very evident clear space. In a less noticeable degree, this is also the case in the other parts of the circumference of the cell, and, apparently, the granular contents have secreted a separate envelope, entirely distinct from the parent filament. The grand climax is now rapidly approaching. The contents of the cell near its base are now so densely clustered as to appear nearly black, (Fig. 1, *c*), while the upper half is of a much lighter hue and the separate grannles are there easily distinguished, and, if very closely watched, show an almost imperceptible motion. The old cellulose wall shows signs of great tension, its conical extremity rounding out under the slowly-increasing pressure from within. Suddenly it gives way at the apex. At the same instant, the inclosed gonidium (for it is now seen to be fully formed) acquires a rotary motion, at first slow, but gradually increasing until it has gained considerable velocity. Its upper portion is slowly twisted through the opening in the apex of the parent wall, the granular contents of the lower end flowing into the extruded portion in a manner reminding one of the flow of protoplasm in a living Amœba. The old cell wall seems to offer considerable resistance to the escape of the gonidium, for the latter, which displays remarkable elasticity, is pinched nearly in two while forcing its way through, assuming an hour-glass shape when about half out. The rapid rotation of the spore continues during the process of emerging, and after about a minute it has fully freed itself. (Fig. 1, *a*). It immediately assumes the form of an ellipse or oval, and darts off with great speed, revolving on its major axis as it does so. Its contents are nearly all massed in the posterior half, the comparatively clear portion invariably pointing in advance. When it meets an obstacle it partially flattens itself against it, then turns aside and spins off in a new direction. This erratic motion is continued for usually seven or eight minutes. The longest duration I have yet observed was a little over nine and one half minutes. Hassall records a case where it continued for nineteen minutes. The time, however, varies greatly, as in some cases the motion ceases almost as soon as the spore is liberated, while in open water, unretarded by the cover glass or other obstacles, its movements have been seen to continue for over two hours.

The motile force is imparted to the gonidium by dense rows of waving cilia, with which it is completely surrounded. Owing to their rapid vibration it is almost impossible to distinguish them while the spore is in active motion, but their effect is very plainly seen on adding colored pigment particles to the water. By subjecting the cilia to the action of iodine, their motion is arrested, they are stained brown and become very plainly visible.

After the gonidium comes gradually to a rest its cilia soon disappear, it becomes perfectly globular in shape, the inclosed granules distribute themselves evenly throughout its interior, and after a few hours it germinates by throwing out one, two, or sometimes three tubular prolongations which become precisely like the parent filament (Fig. 2).

Eminent English authorities have advanced the theory that the ciliated gonidium of *Vaucheria* is in reality a densely crowded aggregation of biciliated zoospores, similar to those found in many other Confervoid Algæ. Although this has by no means been proven, yet I cannot help calling the attention of the members of this society to a fact which I think strongly bears out the said theory: While watching a gathering of *Vaucheria* one morning when the plant was in the gonidia-forming condition (which is usually assumed a few hours after daybreak) I observed one filament, near the end of which a septum had formed precisely as in the case of ordinary filaments about to develop a spore. But, instead of the terminal cell being filled with the usual densely crowded cluster of dark green granules constituting the rapidly forming spore, it contained hundreds of actively moving nearly transparent zoospores, *and nothing else*. Not a single chlorophyll granule was to be seen. It is also to be noted, as a significant fact, that the cellulose wall was *intact* at the apex, instead of showing the opening through which in ordinary cases the gonidium escapes. It would seem to be a reasonable inference, I think, based upon the theory above stated, that in this case the newly formed gonidium, unable to escape from its prison by reason of the abnormal strength of the cell wall, became after a while resolved into its component zoospores.

GROWTH OF THE ALGA, VAUCHERIA, UNDER THE MICROSCOPE.

Wonders of Reproduction.

I very much regret that my descriptive powers are not equal to conveying a sufficient idea of the intensely absorbing interest possessed by this wonderful process of spore formation. I shall never forget the bright sunny morning when for the first time I witnessed the entire process under the microscope and for over four hours scarcely moved my eyes from the tube. To a thoughtful observer I doubt if there is anything in the whole range of microscopy to exceed this phenomenon in point of startling interest. No wonder that its first observer published his researches under the caption of "The Plant at the Moment of Becoming an Animal."

Formation of Other Spores.

The process of spore formation just described, it will be seen, is entirely non-sexual, being simply a vegetative process, analogous to the budding of higher plants, and the fission of some of the lower plants and animals. *Vaucheria* has, however, a second and far higher mode of reproduction, viz.: by means of fertilized cells, the true oospores, which lying dormant as resting spores during the winter are endowed with new life by the rejuvenating influences of spring. Their formation may be briefly described as follows: When *Vaucheria* has reached the proper stage in its life cycle, slight swellings appear here and there on the sides of the filament. Each of these slowly develops into a shape resembling a strongly curved horn. This becomes the organ termed the *antheridium*, from its analogy in function to the anther of flowering plants. While this is in process of growth, peculiar oval capsules or sporangia (usually 2–5 in number) are formed in close proximity to the antheridium. In some species both these organs are sessile on the main filament, in others they appear on a short pedicel (Figs. 3 and 4). The upper part of the antheridium becomes separated from the parent stem by a septum, and its contents are converted into ciliated motile antherozoids. The adjacent sporangia also become cut off by septa, and the investing membrane, when mature, opens at a beak-like prolongation, thus permitting the inclosed densely congregated green granules to be penetrated by the antherozoids which swarm from the antheridium at the same time. After being thus fertilized the contents of the sporangium acquire a peculiar oily appearance, of a beautiful emerald color, an exceedingly tough but transparent envelope is secreted, and thus is constituted the fully developed oospore, the beginner of a new generation of the plant. After the production of this oospore the parent filament gradually loses its vitality and slowly decays. The spore being thus liberated sinks to the bottom. Its brilliant hue has faded and changed to a reddish brown, but after a rest of about three months (according to Pringsheim, who seems to be the only one who has ever followed the process of oospore formation entirely through), the spore suddenly assumes its original vivid hue and germinates into a young *Vaucheria*.

Charm of Microscopical Study.

This concludes the account of my very imperfect attempt to trace the life history of a lowly plant. Its study has been to me a source of ever increasing pleasure, and has again demonstrated how our favorite instrument reveals phenomena of most absorbing interest in directions where the unaided eye finds but little promise. In walking along the banks of the little stream, where, half concealed by more pretentious plants, our humble *Vaucheria* grows, the average passer-by, if he notices it at all, sees but a tangled tuft of dark-green "scum." Yet, when this is examined under the magic tube, a crystal cylinder, closely set with sparkling emeralds, is revealed. And although so transparent, so apparently simple in structure, that it does not seem possible for even the finest details to escape our search, yet almost as we watch it, mystic changes appear. We see the bright green granules, impelled by an unseen force, separate and re-arrange themselves in new formations. Strange outgrowths from the parent filament appear. The strange power we call "life," doubly mysterious when manifested in an organism so simple as this, so open to our search, seems to challenge us to discover its secret, and, armed with our glittering lenses and our flashing stands of exquisite workmanship, we search intently, but in vain. And yet, *not* in vain, for we are more than recompensed by the wondrous revelations beheld, and the unalloyed pleasures enjoyed, through the study of even the unpretentious *Vaucheria*.

[The illustrations accompanying this paper we have made by photo engraving Mr. Breckenfeld's drawings. The amplification of the objects in the engravings is about 80 diameters.—EDITORS PRESS.]

Nevada County Mines.

From a descriptive article of northern central California, in the *Record-Union*, we take the following paragraph concerning Nevada county:

Mining is at present, and will be perhaps for some time to come, the leading industry of the county. Hydraulic mining having been stopped by a decree of the Federal Court, no effort will be made, for some time at least, to wrest from those vast deposits of gravel the fabulous amount of the treasure hidden among its blue and white pebbles; unless, indeed, which is quite improbable, some new method be discovered by which the precious metal can be extracted from those old subterranean river beds. For the time being, that successful branch of mining, which added so much to the general prosperity of the county and State, is entirely ruined, and mining operations are now confined to extracting and crushing quartz and to the drifting of gravel deposits. The gold miner, trying his luck in this county, must rely upon quartz mining for his pile. Gold-bearing ledges are so numerous in Nevada county that they may be said to intersect it in all directions, and with the improvments in modes of crushing rock and saving gold sulphurets the number of new ledges being opened and worked is increasing daily. Ledges that were regarded in early days as almost worthless are to-day worked successfully.

Nevada county is the largest gold producing section on the coast; and it will, without doubt, continue to be such for many years to come. Iron and copper mines are also worked with success in the most southerly part of the county, and there lime is also found in large quantities. The county abounds likewise in marble, agate, manganese and other minerals used in commerce. Hay, potatoes and all kinds, of vegetables are raised in considerable quantities in all parts of the county, up to an altitude of 4,000 feet.

THE MISSOULA PLACER FIND.—Later accounts locate the gold mines reported to have been discovered four miles east of Missoula last week, on a high gravel bar opposite the old Mashall grade, and some distance from the river. It is said to be quite an extensive bar, and that almost inexhaustable locations have been made by Missoulians. Gold is found from the grass roots down. One man got about four inches of water turned on and washed out several dollars in a short time. The gold is reported by some to be very fine, light colors, but the Missoula *Times* says the dust yields from four to six cents to the pan, which would be "big pay." The *Times* further says that water was taken on the bar by a ditch, but as soon as turned on the loose dirt absorbed it, and the effort was abandoned. Parties are now out with the object of going to bedrock, and, if the prospects justify, will bring in a ditch and put on a hydraulic. A Chinaman is said to have offered claim-owners $1 per day for the privilege of putting Chinaman on. Up to latest advices there was considerable anxiety in Missoula to know what the claim amounted to, but not enough prospecting has been done to satisfy it.—*New Northwest.*

UTAH MINES.—The Salt Lake *Tribune* says: Not every one knows the fact, but Utah just now has three mines which are yielding more with less noise than any other three mines in any other State or Territory of the republic. One of them, too, has the best record of any mine in the world, except the Eureka Consolidated. It has never levied an assessment and has paid some $5,000,000 in dividends.

ENGINEERING NOTES.

Pittsburgh Bridges.

With the completion of the Seventh street bridge, says the *Chronicle-Telegraph*, Pittsburgh will be one of the most notable points in the world for the examination of bridge architecture. The old stone structure, involving the heavy arch and the keystone, one of the earliest forms of space construction known, is not represented here, but all modern ideas in bridge-building are most beautifully exemplified. This city will shortly become a resort for those requiring instruction in bridge forms, and it is a source of honest pride that we already have such a diversity of the very best designs known to modern engineering. The Point bridge has but one other like it in the world, and that is in Austria. It is a combination of steel and iron that 40 years ago would have been recognized as one of the wonders of the world. The new Smithfield street bridge is also a magnificent work of metallic architecture, and the Sixth street wire bridge is, without exception, the "prettiest" structu e of the kind on the continent. In the sweeps of its cables, its minareted towers and the curve of each span, there is something so pleasing to the eye that the bridge fastens itself on the memory of all who cross it. Singular as it may seem, the most notable bridge of the entire number is one that attracts the least attention. As "art work in timber," the Ninth street bridge is a curiosity. It is so braced, tenneted and keyed that it is an exceptional piece of mechanical ingenuity. The railroad bridges, also, crossing both rivers are worthy the careful study of engineers. There are few cities in the world where mechanical effects can be studied with more satisfactory results than in Pittsburgh.

NOTABLE CANALS.—The Imperial canal of China is over 1,000 miles long. In the year 1681 was completed the greatest undertaking of the kind in Europe, the canal of Languedoc, or the Canal du Midi, to connect the Atlantic with the Mediterranean; its length is 148 miles, it has more than 100 locks, and about 50 aqueducts; and in its highest part it is no less than 600 feet above the sea; it is navigable for vessels of upward of 100 tons. The largest ship canal in Europe is the great North Holland canal, completed in 1825. It is 124 feet wide at the water surface, 31 feet wide at the bottom, and has a depth of 20 feet; it extends from Amsterdam to the Helder, 51 miles. The Caledonian canal, in Scotland, has a total length of 60 miles, including 3 lakes. The Suez canal is 80 miles long, of which 66 miles are actual canal. The Erie canal is 350½ miles long; the Ohio canal, Cleveland to Portsmouth, 332; the Miami and Erie, Cincinnati to Toledo, 291; the Wabash and Erie, Evansville to the Ohio line, 374. The Suez canal is 26 feet 4 inches deep, 72 feet 5 inches wide at bottom, 329 feet wide at water surface. Length a little short of 100 miles. The Panama canal is to be 45½ miles in length.

A MONSTER BRIDGE.—A monster work in bridge construction is about to be undertaken in Russia. The structure is to be thrown across the arm of the sea, which flows between Cronstadt, the famous fortress that guards the mouth of the Neva and the approach to St. Petersburg, and Oranienbaum, a seaside suburb of the capital of the Czars. The length of the bridge is to be five miles, and it will be stretched across granite columns or piers, whose sides will be protected by angled abutments of granite of considerable hight, and stretching far enough out to furnish a complete protection from the eroding force of the waves when the southwestern gales are blowing.

EXAMINATION OF COALS PROPOSED.—Chief Engineer Isherwood, United States Navy, who deservedly takes rank among the finest engineers and experimenters in this country, urges that a commission of properly qualified scientists be appointed to make, together with an ultimate analysis of the coals and their volatile parts, an exhaustive set of experiments on the heat of combustion of the different coals we produce, and on those of the more important foreign coals with which our own must commercially compete in the near future. He points out that, rightly interpreted, these heats of combustion give the relative calorific powers of the coals, and, of course, respective commercial values.

A RAILROAD ACROSS THE SAHARA.—C. P. Huntington, the great railway magnate, is quoted as saying "he never would be satisfied until he was instrumental in building a railroad across the great Sahara desert, that it was a work he had long contemplated, and, if his health permitted it, he would yet live to see this, the greatest achievement of his life-time, fully accomplished."

THE HUDSON RIVER TUNNEL ABANDONED.—The once famous Hudson river tunnel, upon which $1,000,000 has been expended, has been abandoned, it would seem, forever. The hole is full of water, and as the janitor of the dilapidated building which covers the entrance said to a reporter: "I've lost the kay."

THE strength of the Brooklyn bridge was shown in the last earthquake. Though the shock was felt at both the entrance of the bridge and at the depots, no jar whatever was noticed on the span and in the center of the bridge.

USEFUL INFORMATION.

Theatrical Effects.

In nothing has the property-man improved so much of late years as in the quality and effectiveness of stage lightning. Only three or four years ago the old method was adhered to. A torch with a flame surrounded by a tin box perforated with fine openings, and the box filled with powdered rosin, did duty for this effect. The prompter gave a shake of this torch; the powdered rosin escaped in small quantity and flared up. This was the nearest the stage could come to counterfeiting the artillery of Jove. Now a calcium (or better, an electric) light is completely masked in the wings. When the cue is given for the lightning, the light is unmasked for a second and the rays allowed to flash on to the stage through a lens of greenish glass. The effect of a blinding flash of lightning is perfect. And yet so simple? Yes; and it is the simplest things on the stage that gain the greatest success. The effect of scudding clouds in a storm at sea is only the dragging across the dark flat a net with gauze patches sewed on it, and touched up by the painter to resemble clouds under the uncertain light of the stage. A fog or mist has always puzzled machinists, and puzzles them yet. The best they can do is to hang successive curtains of tarletan or mosquito netting (gauzes they call these curtains on the stage) across the stage at the different entrances, and raising them successively as the fog is supposed to disappear. There is no illusions at all. It never used except when absolutely necessary as in "Midsummer Night's Dream," and even then is often cut out after the first night's trial.—*Mechanical News.*

TESTING BEESWAX.—When the wax is chewed it should have no disagreeable taste and must not stick to the teeth. In an adulterated wax, the nature of the foreign material can generally be detected by the taste; the addition of fat can generally be readily detected. If it sticks to the teeth the presence of rosin may be assumed. A simple method for detecting the presence of fat in wax consists in melting it, and placing a drop on a piece of woolen cloth. After it is perfectly cold and solidified, a few drops of per cent alcohol are poured on and the cloth rubbed between the hands. The wax will be converted into dust, and will easily separate from the cloth if it contain no fat, and will leave no stain; when it contains fat it will leave grease spots. In examining wax candles, they should be broken to see wether the interior is of the same material as the surface, because adulterations of this kind occur quite frequently.

THE COAL TAR COLOR INDUSTRY is chiefly, and in its highest perfection, carried on in Germany, where, during the year 1883, colors in value $1,750,000 were manufactured. During the same time England produced colors in value ten millions, Switzerland six millions, France and Austria four millions each. This is about double the figure of a year's work ten years ago. Coal is now worth ten times what it was at the beginning of this immense industry. On the other hand fuschsine at the beginning of 1855 was worth £50; in 1867 it had gone down to thirty shillings, and at the beginning of 1878 it was selling freely at fifteen shillings per kilogramme. The quantity of coal tar now annually used for the preparation of aniline, anthracene and naphthaline colors is about 600,000,000 kilogrammes.

FLAVORING MELONS.—The Los Angeles *Herald*, a short time since, mentioned the new process of flavoring melons by inserting a strip of cloth in the stem of the melon and immersing one end of the cloth in strawberry, vanilla, peppermint, sherry or some other popular flavor. The San Bernardino *Index*, a temperance paper, tells how the thing was tried in that town. He took lemon in his: "Mr. George Cooley, who lives on D street, some eight or nine days ago, having a fine large melon that was ripening nicely, determined to try the flavoring idea. Lemon was selected as being the most easily recognized. The melon was recently cut and tested. The flavor was delicate but easily recognized, and the new process unanimously pronounced a decided improvement.

SHEEP'S HORN FOR HORSESHOES.—A new horseshoe has lately been experimented with at Lyons, France. The shoe is made entirely of sheep's horn, and is found particularly adapted to horses employed in towns and known not to have a steady foot on the pavement. The results of the experiments have proved very satisfactory, as horses thus shod have been driven at a rapid pace on the pavement without slipping. Besides this advantage, the new shoe is very durable, and though little more expensive than the ordinary one, seems destined sooner or later to replace the iron shoe, particularly for horses employed in large cities, where, besides the pavement, the streets are intersected by tramway rails, which from their slipperiness constitute a source of permanent danger.

TO POLISH FINE CARVED WORK.—Take a half a pint of linseed oil, half pint of ale, the white of an egg, one ounce of French spirits, one ounce of spirits of ammonia; shake well before using. A little is to be applied to the face of a soft linen pad, and lightly rubbed for a minute or two over the article to be restored, which must afterwards be polished off with an old silk handkerchief. This polish will keep any length of time, if well corked; it is useful for cabinet work, and is also recommended for papier-mache work.

BUFFALO HORN FURNITURE. The manufacture of "buffalo horn" furniture has become an industry in New York. The horns are not those of the bison, as is commonly believed, but are from the cattle killed in the abattoirs. They are sold at the slaughter houses for a little more than what the button manufacturers give, are cleaned, dried, scraped and polished. The cost of making these horned goods is less than that of carved wood, but they bring two or three times more than the latter. The new industry is almost monopolized by Germans from Saxony.

OIL FROM SUNFLOWER SEED.—The production of oil from sunflower seed has become an industry of considerable importance in Russia. It is expressed on the spot, and the product is largely employed in the adultoration of olive oil; the purified oil is considered equal to olive and almond oil for table use. The most important industrial applications of the oil are for woolen dressing, lighting, and candle and soap making, it being regarded, for the last named purpose, as superior to most other oils. The Russian article is of a pale yellow color.

COLD WATER IN DEEP LAKES.—D. J. Whittemore, President of the American Society of Civil Engineers, referred, at a recent meeting of that body, to the fact that cold water is frequently obtained by mariners upon the Great Lakes by sinking a corked jug to some depth, and then, by withdrawing the cork, the jug is filled with water very cold and refreshing. Temperature observations on Lake Superior show comparatively constant temperature at the bottom of about 39°, and in depths from 400 to 100 feet.

OUR SALMON FISHERIES.—Perhaps no better idea can be formed of the magnitude and value of our salmon fisheries than through the following paragraph in regard to what has been in only one of our rivers: An examination of Columbia river salmon statistics shows that from the inception of packing in 1866 to the close of the season in 1884 (19 years) there have been packed 6,310,658 cases, with a value of $34,450,000.

A NEW CLOCK has been invented, and is coming into use in Europe, which is warranted by its manufacturers to run for five years without either winding or regulation. The Belgian Government placed one in a railway station in 1881, sealed with the government seal, and it has kept perfect time ever since.

WAX MATCHES.—There is not a single wax-match factory in the United States, all those used here being imported from France, Italy or England, although they also manufactured in Mexico. In England there is an establishment for the manufacture of "vestas," which employs 350 hands.

GOOD HEALTH.

Microscopic Discoveries in Disease.

The use of the microscope as an instrument of scientific research, notably in tracing disease, is yielding truly wonderful results. Thirty years ago the cholera was a visitation involved in mystery; now the mystery exists only in the imagination of the ignorant. Dr. Koch, has demonstrated the causes of cholera to be a microscopic creature, which he calls the "microhe," entering the body through the alimentary canal. He has also discovered methods for its prevention and destruction, and, though its origin remains to be fully detected, he has ascertained its mode of development and its manner of attack. Thanks to the microscope, Dr. Koch finds that the creature thrives only in water, or under moisture where the sporules of decaying organic matter furnish it nutriment, and that it is destroyed by a high heat or through dryness of the atmosphere. Hence he insists that well water, so liable to collect vegetable matter, as also improperly cooked, or inadequately heated, food must be rigorously abstained from, and that artificial heat should be employed as a preventive against the spread of the deadly contagion.

Previous to these latest and most important discoveries, other scientists had, with more or less success applied the microscope in the examination of various diseases. In particular, Pasteur has within the last few years saved millions of money to France through the discovery of the causes of the diseases blighting the silk worm and the vine, and at present he is employing the instrument to find out the nature of hydrophobia and a remedy therefor.

Relying on the powerful assistance of the microscope, high medical authorities to-day contend that the causes of consumption, cancer, yellow fever, and other terrible scourges, will ere long be brought to light by means of more thorough microscopic studies; and here again we are told that parasitic growths will most probably be found at the bottom of the evil.

Although the capacities of the miscroscope have not been understood until a comparatively recent period—it was not until the seventeenth century that powerful microscopes were actively employed in scientific investigations—there is perhaps no other instrument, save possibly the spectroscope, which has undergone such great improvements. As an optical agency it is now at least as perfect as the telescope, and it is fortunate that this is so, for the universe which the first brings under our ken is perhaps of far more practical profit to us than the depths which the second still vainly attempts to fathom. The laws of organization and the nature of vital action are within the grasp of this little, but wonderful, mechanism. *Leslie's Illustrated Newspaper.*

Don't.

Don't go to bed with cold feet. Don't sleep in the same under-garments that are worn during the day. Don't sleep in a room that is not well ventilated. Don't sit or sleep in a draught. Don't lie on the left side too much. Don't lie on the back, to keep from snoring. Don't try to get along with seven or eight hours' sleep out of twenty-four. Don't jump out of bed immediately on awaking in the morning. Don't forget to rub yourself well all over with a crash towel or hands before dressing. Don't forget to take a drink of pure water before breakfast. Don't take long walks when the stomach is entirely empty. Don't start to do a day's work without eating a good breakfast. Don't eat anything but well-cooked and nutritious foods. Don't eat what you don't want just to save it. Don't eat between meals, nor enough to cause uneasiness at meal time. Don't eat the smallest morsel unless hungry, if well. Don't try to keep up on coffee or alcoholic stimulants, when nature is calling you to sleep. Don't stand over hot-air registers. Don't inhale hot air, or fumes of any acids. Don't fill the gash with soot, sugar, or anything else to arrest the hemorrhage when you cut yourself, but bring the parts together with strips of adhesive plaster. Don't wear thin hose or light-soled shoes in cold or wet weather. Don't strain your eyes by reading on an empty stomach or when ill. Don't ruin your eyes by reading or sewing at dusk, by a dim light, or flickering candle, or when very tired. Don't sing or holler when your throat is sore or you are hoarse. Don't drink ice-water when you are very warm, and never a glassful at a time, but simply sip it slowly. Don't take some other person's medicine because you are similarly afflicted. Don't bathe in less than two hours after eating. Don't eat in less than two hours after bathing. Don't call so frequently on your sick friend as to make your company and conversation a bore. Don't make a practice of relating scandal, or stories, calculated to depress the spirits of the sick. Don't forget to cheer and gently amuse invalids when visiting them. Don't call on your sick friend and advise him to take some other medicine, get another doctor, eat more, eat less, sit up, or talk him to death before you think of leaving.

In walking or other exercise, learn to keep the mouth firmly closed and to breathe entirely through the nose. You can walk as far again, with less fatigue and without getting out of breath, than when you breathe through the mouth. Try it.

The best three medicines in the world are warmth, abstinence and repose.

A SEA ATMOSPHERE FOR THE SICK ROOM.—Science is making rapid strides in the direction of prevention and modification of disease. Among the latest advancements in this direction may be noticed a device for a medical aeration of the sick room, by which various atmospheric conditions can be secured. A sea atmosphere may be produced in the following manner: A solution is used, and diffused as spray, consisting of a solution of peroxide of hydrogen (10 volumes strength) containing 1 per cent of ozonic ether, iodine to saturation, and 2.50 per cent of sea salt. The solution, placed in a steam or hand spray diffuser, can be distributed in the finest spray in the sick-room at the rate of two fluid ounces in a quarter of an hour. It communicates a pleasant sea odor, and is the best purifier of the air of the sick room I have ever used. It is a powerful disinfectant, as well as deodorizer, acting briskly on ozonized test solutions and papers. Mr. Carl R. Schomberg has recently invented a large spray producer, which will diffuse the artificial sea air through a hospital ward.

UNITING OF NERVES.—The report that has just appeared to the effect that M. Tillaux has communicated to the Academy of Sciences the successful suture of nerve in two cases, and that in one case function has been restored in a nerve divided for a period of fifteen years, is, if confirmed, one of the most important facts we have had presented to us in our day. The physiologist, not less than the surgeon, will be led to important work by this event, and fresh fields of inquiry relative to nerve conduction may open new and unexpected advances in the theory as well as the practice of the medical art.

A HEALTHY FRUIT.—A lazy dyspeptic was bewailing his own misfortunes, and speaking with a friend on the latter's hearty appearance. "What do you do to make you so strong and healthy?" inquired the dyspeptic. "Live on fruit alone," answered his friend. "What kind of fruit?" "The fruit of industry; and I am never troubled with indigestion."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—Amador *Ledger*, Sept. 10: This mine continues to look finely, with quartz enough for a 30-stamp mill. The company have purchased new hoisting machinery, and are also building a car-track from the mine to the mill, so as to avoid the expense of hauling by teams. Grading for the new hoisting works is being pushed ahead, some 15 or 20 men being at work upon the job. The car-track will be 2100 ft long, and made of railroad iron, which is already ordered. The mill has been idle for want of water, but is expected to start again at the end of this week. Dr. T. H. Mayon has resumed operations upon his quartz claim near Amador City.

Calaveras.

TUNNEL.—*Mountain Echo*, Sept. 9: The Stanislaus River and Mining Co. have commenced work on the tunnel to turn the Stanislaus river at Horseshoe Bend. The header is now in about 60 feet, and is rapidly progressing. Soon the working force will be augmented. John Dart, C. E., of Sonora, has the work in charge. The dimensions of the tunnel, according to the survey, will be 20 feet square and 1400 feet long.

El Dorado.

THE INDEPENDENCE MINE.—*Mountain Democrat*, Sept. 13: When Superintendent John McClellan was in town Tuesday he said that the Independence mine, located near Brownsville, this county, is looking far better than he had hoped for. The ledge is strong, and all the ore taken out will pay well for milling. The 12-stamp mill will be started up as soon as some trifling repairs can be made, when we may reasonably expect a boom in the vicinity of the Independence.

TURNING THE STANISLAUS.—*Mountain Democrat*, Sept 10: The Stanislaus River Mining and Tunnel Co. has inaugurated the work of cutting the big tunnel, through which to turn the waters of the Stanislaus river, at Reynold's Ferry. The work is vigorously prosecuted with day and night shifts. The size of the header, which is now in 100 feet, is 6 by 7 feet. The full size of the tunnel will be 10 by 12 feet. It will be a little over 1100 feet in length, and, when completed, will drain over two miles of river bed.

Inyo.

BEVERIDGE DISTRICT.—*Independent*, Sept. 13: During the past week a good prospect has been struck in the Golden Reef mine, Beveridge district. This is the property lately bought by Mr. Nixon. About 12 inches in width of the ledge where now exposed is quite rich, and the chances are that this will greatly increase in size when opened further. Mr. Nixon brought in the first shipment of gold bullion a few days ago. It is confidently expected that the next shipment will be quite large. In Hunter's canyon, in the same district, some Mexicans have made a rich strike lately, but the full particulars are not yet known. The Keynot mill is running steadily. The present outlook for Beveridge district is better than ever before.

Mono.

THE SITUATION.—Homer *Index*, Sept. 9: Nothing definite has yet been learned as to what will be done about the present muddle of its affairs by the May Lundy mine owners. While many still have confidence that the indebtedness of the company will be paid without process of law, that feeling is not so general as it was a week ago. Rumors that the miners would be paid soon have been numerous during the week, and reports to the contrary quite as plentiful, but none of them could be traced to any authentic source. Several dispatches have been received from headquarters in San Francisco and also from F. A. Pike, but such of them as have been made public have not given any information as to what will be done. There are many people in Lundy who will not believe that Pike will allow the May Lundy to go under the hammer until they see it done. The property is too valuable for its owners to lose rather than pay the few thousand dollars indebtedness upon it.

A NEW LEASE OF LIFE.—Homer *Index*, Sept. 13: It would seem as though the May Lundy mine had actually been sold, the deeds signed and delivered and the money paid over at last. The miners having notified the late owners that they (the miners) would file liens unless paid on or before the 15th instant (Monday next), George W. Butterfield, who was one of the owners and who negotiated the sale of the property, telegraphed back from San Francisco that the time allowed was all that was desired, and that the miners would be paid on the 15th, or sooner. Fox & Kellogg also wrote and telegraphed on Monday last that the mine had been sold, that the money was in the hands of a third party, to be paid over as soon as the instruments of the sale were completed, and that the only remaining document or deed to complete the sale was in the registered mail to arrive by overland train that afternoon —the train having been delayed. It is not yet known here who the purchasers are, but it is believed that they are the same English and Scotch capitalists with whom Mr. Butterfield has been negotiating for the past twenty months. Nothing is yet known of the intentions of the new company, but work in the mine will doubtless soon be resumed, and prosecuted all winter. In any event, Lundy will have quite a boom next week over the disbursement in our midst of some $35,000, and all the indications are favorable for the steady growth and permanent prosperity of the camp. Work is being steadily prosecuted on the Tip Top, White Cloud, Collamer, Josie Green and other mines on the mountain between Mill Creek and Lake canyons. It is reported that the clean-up of the Gorilla M. & M. Co, on Monday last was an unusually heavy one. The mine and reduction works are running full handed. Another Eastern company is in process of organization to mine in Tioga district, to develop the Rinedollar group of mines. Twenty-five to thirty men are still engaged in prospecting work in Tioga and Prescott districts. The Bryant mine is still turning out rich ore, and making steady and heavy shipments of bullion.

Nevada.

NORTH STAR MINE.—Grass Valley *Union*, Sept. 9: A visit to the North Star mine, yesterday, showed a scene of busy labor, as about forty men in all were at work upon the buildings, excavating for foundations for machinery, doing mason and other work. A large part of the frame of the hoisting and and pumping works is up, which will be a building 65x135 feet. William S. May is superintending the building of the structure, and the work goes on rapidly. The bob pit is nearly excavated, and the enlargement of the upper portion of the old shaft into three apartments is well under way. A large space of ground near the new works is covered with machinery and material of various kinds, ready to put in place as needed. A stock of 300 cords of wood is accumulating on the yard, and altogether it begins to look as if old times are coming again at the North Star. Much work has been done within the short time since operations were commenced, and much remains to be done; but, in the way in which everything is being pushed, Superintendent Stoddart says steam will be started up early in October. The shaft is being put in better shape than ever before, and the track will be laid with T rail, which is now on the ground. The drain tunnel, which is 2,600 feet in length, has been cleaned out one-half its distance, and has been found in excellent condition, only a few setts of new timber being found necessary, although the tunnel has been in disuse for a number of years.

NEW MACHINERY.—Nevada *Transcript*, Sept. 9: At the Nevada City mine the management has for some time past been principally engaged in putting in new machinery of great power, and doing a vast amount of dead work underground. Now the taking out of ore in large quantities is going on again. Some of the quartz being hoisted is as rich as any ever found in the mine. At the Hussey mine in Willow valley, a back ledge, much larger and richer than anything heretofore found in the mine, has been developed and the owners are getting it opened up as rapidly as possible.

Placer.

A RICH MINE.—Placer *Herald*, Sept. 13: The Hawkins and Peardon boys, owners of the famous Morning Star quartz mine, below Ophir, have lately resumed work again, and are taking out better rock than the mine ever produced before. We were shown some specimens by them a week ago, taken from the south drift of the 300-ft level, which were literally sprinkled with gold. They have now over 100 tons of ore on the dump which they estimate will go over two ounces to the ton. Their ledge is from 2½ to 3 ft thick and is all milling ore. This mine has a wonderful record as a gold producer, and it seems to improve as it becomes better developed.

Plumas.

THE CRESCENT.—Greenville *Bulletin*, Sept. 10: Mr. Geo. P. Cornell having been appointed superintendent of the Crescent mine, went down there on Thursday and took charge of the property. The company have had some legal complications to contend with, and they have not been disposed to operate the mine till those obstacles are out of the way. Save one, these legal difficulties are now settled, and the community will join in wishing that the remaining one shall be settled satisfactorily to the litigants. Mr. Cornell hopes to have the mine operated soon after the legal difficulty is disposed of. The Crescent mine has been one of the richest in this section, and it is confidently believed by our best mining men that should the company sink on the mine, they would reap a rich reward for the outlay. Mr. Cornell is a close calculator and an economical miner, and will make the best use of the funds placed at his disposal for the development of the mine. That he would soon have it paying well we have no doubt. Work in the Sunset mine is progressing. C. G. Rodgers was in town yesterday. Things at the Green Mountain are running regularly. The New York mill is now running on ore from the Central Ledge, a claim adjoining the New York. The Arcadian mill has ceased to run on Forest King rock, the lease of the mill having expired. The owners of the mine have made a handsome profit, and they will now further develop the mine.

Shasta.

PAYING WELL.—Trinity *Journal*, Sept. 12: While we were at French Gulch, Shasta county, last Saturday, we learned that the quartz mines in that district were all doing well. The Niagara, owned by Wm. T. Coleman, of San Francisco, shipped $16,000 last month, running a 12-ton cannon-ball mill. Thos. Green is running a 6-ton cannon-ball on ore from his mine, the last clean-up being something over $1,000 from 60-hours run, the total product for the month being $3,500. The Brunswick mine has about 200 tons of good ore on the dump and will put in a cannon-ball mill already ordered, as soon as it is received.

San Diego.

PINACATE MINES.—*Press and Horticulturist*, Sept. 13: But while the tin deposits are in litigation and the property unimproved, it is not generally known that, in the same mineral belt and within 20 miles of Riverside, there is a new and daily increasing interest in the gold-producing ledges of the Pinacate district.

For the past three or four years the Mexicans have been "gophering" into these gold-bearing veins for rich pockets that would pay to work in their crude way, and abandoning them as soon as the pocket was exhausted or when they reached the water level. The Good Hope and its extension in the Pinacate district, and the mine worked by Mr. Hoag on the Sobrante are all the properties that have had any money expended on them in the way of systematic development, and, in both cases, the result has been a rich return for their expediture. In both cases the shafts are down 200 feet in well-defined ledges, that, as the excavations proceed, steadily improve in width of vein and richness of ore. Mr. Hoag's mill is running night and day on ore from his mine on the Sobrante, and Mr. Moore's (formerly Lawshe's) is crushing very rich ore from the Barber mine or extension of the Good Hope. To this last mill Mr. Moore has added a concentrator to collect and save the sulphurets which are found in nearly all the ores in that vicinity, and which increase in quantity and richness with the depth of the vein. Mr. Moore, who is reported to represent a Wisconsin company, has also bought the Santa Fe, and other locations that have been sufficiently prospected by the Mexican method to class them as paying claims, and has several men at work on one or two of them. A St. Louis Co., has also invested in several of these Mexican claims, and intends to put up dwelling houses and a 10-stamp mill this fall, at what is known as the "Virginia" claim or "Camp Castillo," about fifteen miles due south of Riverside. A mile farther south, just over the range, at the head of a valley or park, known as Cedar Flat, Mr. H. C. Steele, of Missouri, has purchased another of these claims—the Plomo—which formerly supplied three arastras with ore. He is taking out $100 ore in the Plomo; has several other locations which prospect well, and will put up a mill as soon as he has sufficient ore in sight to warrant the investment. The best developed Mexican mine in this district is the Colorado, owned jointly by Louis Martini, a Mexican, camped near the mine, and a gentleman from Riverside, This mine has supplied from three to five arastras with ore for the past year, and several Americans are anxious to possess it, but there is a dispute about the title and it will not change hands until that is settled; and when it is settled the lawyers will undoubtedly own it. In addition to the above a San Diego company has located five claims in and near Cedar Flats and are now at work on two or three of them, one shaft having been sunk to water (80 feet), and one or two others to a less depth. Probably twenty additional claims have been located by Americans in the Pinacate district within the last two months, nearly every one of which carries gold from the surface. Some of the larger ledges give indications of silver, and one iron-capped ledge has been discovered that assays seven per cent tin. Nearly all the locations referred to as gold bearing lie between the first two mentioned, which are the best paying because they are the best developed mines in the group, and they are all of the same general character and all improve with increasing depth. That gold exists in paying quantities on the Sobrante and in the adjoining Pinacate district is proven by the work already done. Capital is now being invested in that vicinity, and there are scores of claims that only await a small outlay in the way of improvements to become first self-sustaining and then to yield as rich returns as the Hoag, Moore, and Barber mines.

Sierra.

PROSPECTING.—Sierra *Tribune*, Sept. 10: George Davis and Lem Davis this week went up to do some work on their ledge in Lady's canyon. They will sink a shaft and otherwise prepare to prospect the claim. The vein is about 6 ft wide and promises well. It is located north of the Columbo mine.

Trinity.

RICH QUARTZ.—Trinity *Journal*, Sept. 12: Mr. J. L. Day was in town this week from East Fork and displayed some very rich specimens from the mine of Day, Moor & Co. He tells us that they are now down 25 ft on the ledge and that it has improved both in richness and extent. Jake Holsinger and his partner have lately discovered two ledges running parallel, about 15 ft apart, one being two and the other 6 ft in width. Both prospect well, the smaller one showing very rich in free gold. Messrs. B. M. Lough and Murray, both quartz experts and miners of large experience, are now at East Fork and are well pleased with that section. They have been all over Nevada, and only lately came from Bodie, and say they never saw so much gold in quartz as in that shown them at East Fork. The district is rich and extensive and should receive more attention from prospectors than it has this summer.

DEADWOOD.—Cor. Trinity *Journal*, Sept. 12: I paid a visit to the Montezuma which is the personal property of Mr. Klein. In places the ledge varies from 8 to 20 ft in width most of which is good paying ore. A cannon-ball mill of 6 ton capacity is being erected and bullion will be the closing result of the next season. Mr. Stewart Gibson and Frank Belleau have struck an "eight footer." From "Stewart" I learn the rock is highly auriferous and improves both in richness and size as they continue. Otis Collopy has discovered a very rich lode on Thorn gulch the rock showing free gold and estimated to go $100 to the ton. William Lapin is taking out ore in different places all over his location, there being four or five veins upon the hill above the main lode. McDonald & Franck's new mill is a beauty and sends encouragement to the prospector's ear when she toots up her morning song. From what I learn Mr. Watt and others have purchased the property of Lambeth & Grayson and will continue operations on the mine. Four mills will soon be in operation and the next season when the "rain begins to fall" Deadwood with her arastras and mills will be in the hight of her glory.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise* Sept. 13: Work has been temporarily suspended in the main north drift on the 2800 level. It is ont 275 feet, and work in the drift was suspended for the reason that sinking has been resumed in the winze, and until a certain depth had been attained in the latter the coming in of cars from the drift interfered with the business of sinking. The draft is now out far enough to allow of two cross-cuts being started. These will soon be commenced. The usual amount of ore is being extracted from the 200 level and shipped to the Eureka mill. Since last report they have received bullion to the value of $8,-339.08 from the Eureka mill. Work in the north drift will be resumed this evening.

MEXICAN.—The joint Ophir, Sierra Nevada and Union Con. winze below the 3200 level has been sunk and timbered about eight feet. The usual vein porphyry is taking the place of the bastard quartz which has heretofore been the predominant material at the bottom of the winze. This porphyry, however, is largely composed of quartz and presents a lively appearance. The winze is below the 3300 level and in about another week will have attained a depth sufficient to have a sump 10 feet in depth below that level. A station will then be opened and a cross-cut started west on the 3300 level.

BEST AND BELCHER.—The main west drift on the 2500 level is out about 650 feet. It is in a soft vein material, much mixed with stringers of quartz. This drift will be pushed through to the west wall. The north drift from the 825 station of the Bonner shaft is out about 356 feet. It is in a very favorable material, which appears to indicate the presence at hand of a deposit of metal-bearing quartz.

OPHIR.—On the 250 level some ore is still being extracted from the fillings of the old drifts. On the 500 level they are pushing forward the main west drift at the rate of about 70 feet a week. This drift will soon drain the vein at the old works.

CHOLLAR.—Cross-cut No. 2. on the 2800 level, was run out to the west wall, passing through about 20 feet of quartz of good appearance but carrying only a small amount of metal. Work on the level has been suspended, and they have now resumed sinking in the Chollar-Norcross-Savage shaft, which will be put down to the 3,000 level as speedily as possible. Thus far the work of sinking is progressing rapidly. The pumping apparatus at the shaft is all working well and smoothly.

SIERRA NEVADA.—Are still repairing the draft on the 2300 level through which passes the compressed air pipe.

ALPHA.—The north drift on the 600 level is out nearly 700 feet and the east cross-cut 100 feet. The west cross-cut in Alpha ground, 125 feet north of the Imperil line, is in quartz of a very promising appearance.

ALTA.—Good headway is making in the main east drift on the 2150 level. The water is fast draining out through the diamond drill holes that were run from the face of the drift. The last of these drill holes penetrated the vein a distance of 44 feet, and the drillings gave assays as high as $54. The chances for finding a paying deposit of ore to the eastward are good.

CON. VIRGINIA AND CALIFORNIA.—A drift has been started north on the 1750 level, which will explore a large section of new ground lying to the northward of that portion of the old bonanza ground which was inclosed by means of bulkheads at the time of the fire in the old timbers, some years ago.

YELLOW JACKET.—A considerable amount of ore of low grade is still being found, and some prospecting is being done to open out further supplies. The water supply in the Carson river is falling off somewhat, and the mills cannot be run to their full capacity.

BELCHER.—About the usual amount of low grade ore is being extracted. The volume of water in the Carson river has considerably decreased, and not so much ore can be reduced at the river mills as formerly.

BENTON.—The drift on the 2150 level is passing through quartz of a very favorable appearance, which carries a considerable amount of metal, but not a sufficient quantity to pay for working.

CROWN POINT.—A sufficient amount of ore is still being found to keep the mills on the Carson at work, though, owing to a decrease in the volume of water, they cannot be run to their full capacity.

Aurum District.

PROSPECTS.—White Pine *News*, September 8: From James McNulty, of Aurum, who has been spending several days in town, we learn that the prospects of that district are growing brighter every day. This season Dr. Brooks has done a great deal of prospecting, with most encouraging results. The Sadie L. is looking especially well. A drift run from the tunnel has cut a ledge five feet wide of good milling ore. The mill will be started up this fall, and a prosperous run is sure to be made. Dr. Brooks is to be commended for the faith and energy he has displayed in unearthing the mineral wealth of Silver Canyon District. May he reap a rich reward.

Bristol District.

ORE.—Pioche *Record*, Sept. 6: There is a large pile of ore from the Day and Mendha mines piled on the furnace dump at Bristol, and the teams keep hauling right along. Foreman Walsh, while we were out there on Monday, informed us that the furnace would be in repair and running in about ten days or less. The coal-burners are now all out burning coal, and the coal which was burned for the Bullionville Company, before it was closed down, is now being hauled out to Bristol. This coal has to be hauled about 40 miles.

Comet District.

BIG LEDGE.—Pioche *Record*, Sept. 6: Clark & Willett have the best prospect in Comet district. They have paid their way ever since they have worked the mine. The ledge is narrow and very rich. Freudenthal & Co. have a good prospect. The ledge is a big one and the croppings assay well. The croppings indicate a big mine somewhere in the vicinity.

Garfield District.

WORK PROGRESSING.—Grantsville *Bonanza*, Sept. 6: From James Graham, who has just returned from Garfield District, Esmeralda county, we learn that work is progressing steadily in the mines with the most encouraging results, and that there is enough ore out now to run the mill for a year to come. The mill is fast nearing completion, and will soon be rendering a good account of itself by the magnitude of its bullion shipments. The ores in this district are high grade.

Osceola District.

GOOD RETURNS.—Pioche *Record*, Sept. 6: The rock from Boone Tilford and Capt. Akie's gold mines worked in the Osceola mill came up to expectations. Tilford's rock went $81 to the ton, and Akie's $33. The former cleaned up over $2,000 and the latter $1,200. This showing, says the Taylor *Reflex*, will go far toward giving a different coloring to the black-eye Osceola got by the failure of the Monroe & Linton to pan out well. We are told, by those who are in a position to know, that the Monroe & Linton, purchased by the Osceola Mining Co., is by far the poorest prospect in the camp.

Pennsylvania District.

PAYING WELL.—Pioche *Record*, Sept. 6: The mines down in Pennsylvania district, on some of which there has been work going the past two months, are looking well. The ore ledges look fine, and the only thing needed to make a lively little camp there is to get a company in; but whenever a company forms to take hold of one of the mines, some one of the mine owners always elevates their price from what they first agreed to take for the property, and thus it has been going on for years,

Sherman District.

THE BURKE MINE. Reno *Journal*, Sept. 10: Farmer Burke and Doctor Brooks came in from Sherman District yesterday, and will leave this morning for their home in White Pine. They have made all arrangements for systematic work on the Sherman mine, having purchased hoisting works, buildings, etc., in Virginia. They leave all details with Jim Burke, who will at once have the works taken down and removed to the mine." As this mine is situated a few miles to the northward of this city, on what is supposed to be a continuation of the Comstock silver belt, our people naturally watch the progress of development with some interest. Should a good mine be found, the ore in which showing the Comstock characteristics, it would give points for the sinking of prospecting shafts in intermediate places.

ARIZONA.

MOHAVE. *Miner*, Sept. 13: John O'Brien and Isaac Conkey have just finished the assessment work on the Railton mine below Stockton hill. This claim has a two-foot vein of lead ore averaging from 25 to 30 per cent in lead, 75 ounces in silver and is owned by Messrs. Davis and Atchison. J. F. Luthy has a car-load of ore ready to ship from the Leadville claim near Cerbat. J. C. Asbury is working on the Queen Bee on the summit of the Chloride trail and has struck some $1,000 ore. Messrs. Williams and Roberts have about 200 sacks of ore on the Todd mine ready for shipment which will go in the neighborhood of $200 per ton. Messrs. Wright and Layne have struck an 8-inch streak of 70 per cent galena on the Prosperity mine in Todd basin. They have two men at work on the claim.

COLORADO.

RED ELEPHANT MINES.—Colorado *Miner*, Sept. 8. Louis Baehr, lessee on the White lode, shipped a car-load of ore to the Miner's Sampling Works, Thursday. Syster & Co. have struck a new streak in their workings. It varies from 4 to 20 inches solid, and will mill-run from 250 to 300 ounces per ton. They will ship again next week. Olson & Co., on the Boulder Nest mine, had the following mill-runs this month: One lot run in one class gave 178 ounces silver; another lot run in two classes returned 112 ounces first class and 39 ounces second class. Messrs. O'Brien & Co., lessees on the White lode, had a mill-run which gave returns as follows: 3,110 pounds, 178 ounces silver; 8,672 pounds, 79 ounces silver. Henry Thompson, lessee on the Boulder Nest mine, had two runs this month which gave returns as follows: 414 pounds, 70 ounces silver per ton; 2,099 pounds, 170 ounces silver per ton. I. W. Irwin & Co. had a mill-run from the Boulder Nest which gave the following returns: 4,851 pounds, 128 ounces silver per ton; 6,099 pounds, 112 ounces silver per ton. John Leahy milled some of the ore from the White dump which gave returns of 119 ounces silver per ton. Potter & Co.'s last mill-run from the White mine gave the following returns: 3,727 pounds, 109⅛ ounces silver per ton; 12,985 pounds, 49½ ounces silver per ton.

EMPIRE MINES.—Messrs. Sigel & Co. have made application for a patent on their lode and mill site below the Big Chief. They will soon construct a tram from the mine across to the wagon-road. Col. John M. Dumont is working a large force of men at his mines in North Empire. He is also repairing the old Pioneer mill.

GOOD REPORTS.—Good reports come from the different mines in Daily and Atlantic districts. The Mountain Ram mine, in Daily, has produced some of the richest ore ever found in the State, running over $20,000 per ton. Mr. Charles Robinson has charge of and owns an interest in this property. The Homestake mine, owned by Mr. Armstrong Shepherd, improves as depth is gained. This lode is located in Atlantic district and is in a neighborhood where a number of good lodes have been discovered. The Wise-Speck Mining Company have commenced active work on their Dexter lode on Red Elephant mountain, having let a contract this week to sink the main shaft. This lode is situated near the famous Boulder Nest, White, and other paying lodes, and will no doubt develop into a good mine. This company also own property in Atlantic district that looks well, especially their Ella lode. At Empire they have the Pilot Knob, a gold lode on Silver mountain. The Mendota lode in the Victoria tunnel has been leased to Sheehan & Co., they taking 600 ft on the west side. They will immediately commence development work and rapidly push a drift to the limit of their lease. This will give them four double stopes of 150 ft each and sufficient to give employment to 32 men. Messrs. Hood & Co. take a lease on the east side of the tunnel and will open ground to the east end line of the Mendota. Messrs. Markey & Co. are working a group of lodes on Lincoln mountain, near Empire. There are several lessees working in different places on the group. A mill-run from the Lucky lode, one of this group, gave 284 ounces silver first class, and 96 ounces second class. An assay recently obtained gave 1,794 ounces. Some of this ore carries horn silver, which is not characteristic to this section of the country. Mr. Hulliberger has discovered a splendid gold lode near the head of Fall river. The crevice shows it to be a fissure vein and the material is unusually rich. Some of the pay streak recently tested gave returns of over 50 ounces in gold. The whole crevice material runs over 7 ounces gold. Good reports are received this week from Bullion camp in Ute creek. The Mollie Downs lode, now being worked, is producing very large returns of good ore. A specimen from this lode brought in this week by Mr. T. S. Wilson shows well in black sulphurets. This ore mill-runs 160 ounces per ton. Assays have been had as high as 800 ounces.

IDAHO.

BONANZA AND CUSTER.—Idaho *Messenger*, Sept. 9: At these places we looked over the mines a little and found them as follows: The Juliet has now a tunnel run in on the lower workings 400 ft in length which strikes the ledge. They are down by shaft and raise 191 ft. There is a drift to the right of the tunnel, or to the east on the ledge 55 ft and to the west 35 ft, and has been some stoping from the left drift. This mine has now a comfortable building for its help built by the superintendent since he commenced the above developments. Wm. Toole has had charge of nearly all the work ever done.

THE CHARLES DICKENS still shows the same superiority over other mines throughout the world, but on account of the death of the discoverer and owner, Wm. A. Norton, is lying idle. There is about 75 tons of very superior ore on the dump, and very large amounts of second-grade ore, besides there is a body of tailings at the arastra that is said to contain a large amount of wealth. This mine, with other valuable mining property, is now being probated and the cessation of work thereon makes the country quite dull. Nothing to discourage permanently, but quiet, very, at present. The General Custer mill is running on Unknown and Summit rock, crushing an average of about 33 tons per day. The latter runs higher in gold than is common for the adjoining claims but far less in silver than the Unknown and Custer have generally done. The pay chutes of the Summit and Unknown seem to have been well worked out, and the mill will be supplied in a short time from Custer rock again.

THE CUSTER.—There is still considerable of the original Custer ore "in sight," and more hope of the main vein of this part of the lead going down than the Unknown and Summit. Still, where a lead is as rich as this whole vein has proven, there is no telling what may be found by further working. Millions of net profit in so short a time as these mines have been run, with the small amount of machinery used, challenges a favorable comparison in vain. Thirty-seven hands in all were working on the mountain at the time of our visit.

NEW DISCOVERIES.—Idaho *Messenger*, Sept. 9: In the Great Basin, on the north side of the Sawtooth range of mountains, at the head of Valley and Cape Horn creeks, a number of promising prospects have been discovered of late, of which our correspondent writes: "Buckskin" and group of mines in that vicinity are 8 miles up Valley creek from Stanley basin. Ten or twelve locations are made. The ore is clean and free chlorides and sulphurets. The ledges, so far, are from one to two hundred ft in width. The ore, as shown by assays, runs all the way from 20 to 265 ounces silver and $3 to $10 gold. The Buckskin, the original location, was discovered a year ago, and is owned by Joseph Dorsey, J. P. Keenan and the W. A. Norton estate. Other claims in the vicinity are located by Tom Cassaday, John J. Gaunt, J. H. Lee, F. J. Clyde, C. C. Clawson, E. G. Dodge, Wm. Galatian and others. The mines are easy of access, and promise well, so far as surface showings are concerned. The Wonder mine, on the south side of Jordan creek, and about one mile from Montana hill, is developing finely under the work of Jack Dougherty. The tunnel is in about 130 ft, and over 100 ft from the surface. The ledge is one to two ft in width—struck in a cross-cut and the ore is full of ruby silver, assaying from 130 to 7,000 ounces silver per ton. This promises to be one of the best mining properties in the district, and is owned by Wm. and Joe Galatian. The Whale mine, owned by the Galatian brothers and Jas. Hooper, is leased for nine months.

A PROMISING FIND.—Wood River *Times*, Sept. 10: Thomas B. Garden came down from his prospect, six miles below Galena, yesterday, and exhibited some specimens of rock from a 14-inch vein of ore he had just struck. The rock is a peculiar formation of quartz and galena, and if present indications hold out, the mine will become one of the best-paying properties on the river. An assay from a choice specimen gave returns of 155 ounces of silver and 67 per cent lead. Mr. Garden and his partners are old prospectors in this district, and, thinking they have struck the long-sought bonanza, are of course jubilant. They hold the value of their prospect at $40,000.

MT. KING.—Idaho *World*, Sept 9: I. N. Daley, one of the owners of the Mountain King mine, on Sheep mountain, arrived here on Saturday and gave us a few items: Fifteen tons of Mountain King ore, recently packed to the Bayhorse smelter, turned out 100 ounces per ton silver, and 53 per cent lead. They have out 7 or 8 tons more of good ore. The Mountain King mine shows up 50 per cent better than it did last year. The ore that was smelted this season was not assorted, and ran over $100 per ton. Work will probably be carried on in this mine all next winter. The owners of the mine are making preparations for the winter. It is the intention to run a tunnel to tap the vein at the depth of 100 or 150 ft. Ore, unassorted, from the Graybound mine, crushed in the Custer mill, turned out 150 ounces per ton. The ore carries both gold and silver. The bullion is worth between $2.50 and $3 per ounce. A shaft was sunk on this mine this season to the depth of 50 ft. The ore improves in richness as they go down. The owners of this mine intend to make another shipment of ore to the Custer mill this fall.

THE PARKER GROUP.—Wood River *Times*, Sept. 10: The Parker group, on Trail creek, continues to yield the usual quantity of ore, the production being limited to 70 or 80 tons per month as the managers wish to keep the development work ahead. But the ore extracted, nevertheless, suffices to pay all working expenses and a profit of $7,000 to $10,000 per month besides. The grade of the ore, too, is enhancing with depth, and the last lot received here a day or two ago, was the best yet. It consisted of 13½ tons, which carried 29 ounces of silver. Its gross yield was $378 per ton—thus leaving fully $300 net, per ton.

ANOTHER ORE-PRODUCER.—The first shipment for the year of ore from the Baltimore and Victoria group of mines has just been received here. It was a lot of 11½ tons, which carried 66⅔ per cent lead and 132 ounces of silver per ton. It netted $1,454.31. The showing of ore in that group is said to be equal to any other on Wood river.

NORTHEASTERN ALTURAS.—Wood River *Times*, Sept. 10: In addition to Blackburn mining district, in Eastern Alturas there are two other camps in that region that are of considerable importance. Badger Creek is one. It is located about 12 miles north of Blackburn district, but in the same formation and on the same belt and vein as the Blackburn district. The most prominent claim there is the Triumph. This is one of the mammoth mines of Idaho. The galena vein is of enormous width, and the ore is so nearly pure lead that it can hardly be broken with a sledge. It flattens out under the hammer. But it goes quite low in silver, as it does not carry over 20 to 40 ounces. From Badger Creek north to Spring Mountains, is only six miles, but here again is another promising camp—Pease & Taylor's. About eight miles further north is Texas camp. All these are on the same huge vein seen in Blackburn district. On the east side of Birch creek, about six miles east of Badger Creek, is the famous Viola mine, which has for many months been yielding 2,000 tons of rich shipping ore. It promises to continue yielding for years.

MONTANA.

AMONG THE MINES.—Butte *Miner*, Sept. 10: Yesterday the *Miner* reporter took a stroll over the Parrott hill, upon which the big copper mines are located. Some parties call the Parrott lode the "Mother lode" of the camp. If one stands at the Mountain View mine and runs his eye along the line of hoisting works from the Montana Colusa to the Original Butte, he will see that all the mines in that line appear to be on one lode. In this line are to be found the most valuable mines, so far worked in this district. The Parrott is one of the big properties of the district. The shaft is 350 ft deep. Ore is being taken out of all the levels at the rate of about 3,500 tons per month. No new work is being undertaken just now. The Montana Parrott, adjoining the Parrott on the east, belongs to the Montana Copper Co. It is a claim 200 ft in length. On this claim there are two shafts. The original shaft is 130 ft deep and follows the lead. From this shaft about 1,200 tons of ore were taken last month. The other shaft is a perpendicular, three compartment shaft, and is now 218 ft deep. This is to be the working shaft. Large hoisting works are in process of erection now.

RAMSDELL PARROTT.—This mine belongs to Mr. Joseph Ramsdell. It was taken up under the old law, and consequently is only a 200 ft claim. There is on it a shaft 260 ft deep. The ore is being taken out of the levels from the 160 to the 240-ft levels. The mine has up to this time been worked with a whim, but a steam hoist is to be put up this month. About 30 tons a day are being taken out. This mine is sending about 50 tons a day to the Bell smelter, 20 tons of this coming off the dump. About two-thirds of this passes through the concentrator before being put in the smelter. The balance goes directly to the smelter. Just east of Ramsdell Parrott is another claim of 200 ft belonging to the Montana Parrott Co. No work is being done on this claim at present. From the Ramsdell Parrott through the claims to the Parrott a level has been run for ventilation. A brief mention was made the other day to the effect that the Anaconda and St. Lawrence had been letting up on their work for the purpose of making some repairs. These repairs are progressing finely, are almost completed, and this week will be again running on full time with a full quota of men. The new office of the company is nearly ready for occupancy.

MOUNTAIN VIEW.—This is one of the finest and most valuable properties in the district. There is on the lead a shaft 635 ft deep. Sinking has now ceased and cross-cutting at 608 ft is going on. At about 30 ft north of the shaft at this level a small vein of fair-looking ore, 2½ ft wide, was struck. A level is being run on this vein. The workmen are in about 30 ft. The quality seems to be improving as they proceed. Mr. C. X. Larabie, the owner of this property, is putting up a new hoist. Several hundred ft east of the shaft-house of the Mountain View and down the hill is the claim called the West Colusa. It is owned by the Montana Copper Co. On this is a shaft 160 ft deep. Water was encountered at about 100 ft down and there was plenty of it, so much indeed that a steam pump was necessary. The mine is worked with a whim. Adjoining this claim on the east is Clark's Colusa. This has become one of the celebrated mines of the camp. The shaft is now 300 ft deep. At that depth the shaft is in the vein. A station has been put in and a level is being run east and west. This mine is shipping about ten tons a day of first-class ore, and Mr. Clark is smelting at the Colorado smelter about 25 tons a day. The Colusa, the property of the Montana Copper Co., is also one of the best-known mines in the district. Recently the company has been sinking from the 400-ft level to 500 ft. The station at that depth has not been completed and the work of sinking another hundred ft is to be begun right away. In the mean time a great deal of ore is being taken out of all the levels. This review of mines only embraces the copper mines on the Parrot hill east of town and in an almost straight line from the original Butte to the Colusa. Any mine whose shaft-house is more than 300 ft away from that line is not included in this enumeration.

THE MOUNTAIN CHIEF SOLD.—The Mountain Chief mine, at Neihart, bonded some time ago to the Boston Hudson Mining Co. for $18,000, was sold to that company last week. They have on the dump 500 tons of ore, valued at $50,000. The company proposes to put up a mill at once. The business manager has gone East to ship the necessary machinery.

THE NEW DIGGINGS.—A committee of two miners, T. P. Asyling and Denis Halpin, was recently sent from Benton to the newly discovered gold mines in the Little Rockies, 135 miles north of Benton, to examine and report on the same. In due time they sent word that the mines were all they had been represented to be, and since then, about the 10th inst., everybody who could go made a stampede from Benton to the new El Dorado. The *River Press* of the 10th had an interview with Frank Aldrich one of the original discoverers, and he said: "We struck it on the 15th of June. Charley Brown and myself were prospecting the Little Rockies, and came upon Louis Meyers, or Dutch Louie, in this gulch. He had found good indication, but had not prospected the gulch well. We propose to cross-cut the gulch, working together, and did so. We found two channels, where big prospects were got. On bedrock where we worked, we got as high as $3.50 to the pan, and it averaged at least 25 cents. There is 5 ft of solid gravel in the channels that averaged a bit to the pan. After doing a good dead of work, and satisfying ourselves that we had big paying diggings, our grub pile got low, and myself and Brown went to Assinaboine for a new supply. We were gone just two weeks and two days, and during that time Louie rocked out 8 ounces of gold, a result that rather tended to elate us. I took this money and went to Maiden to secure additional supplies and some lumber. I endeavored to keep the matter a secret, but by my disposing of the dust it got out, and soon after some 50 men from Maiden and vicinity took the trail and followed us. This was the beginning of the stampede. Seeing it was out, we then proceeded to protect ourselves. A district was organized and laws adopted. Discovery claim was set apart for myself, Brown and Myers and then each of us located claims. A claim is 300 ft from rim to rim. We then commenced work in earnest, my company opening No. 11 above discovery. It paid on an average over $10 a day to the man until I left, and will continue to do so. Bob Main and Charley Smith were preparing to sluice on No. 24 above discovery when I left. They took out $20 one day with a rocker. Our company had $350 in gold, and I brought about an ounce and a half of it with me, as a sample of Little Rocky dust. I am certain, from pretty thorough prospecting, that every claim in that gulch—about four miles in extent—will pay, and I believe the best claims have not yet been touched. I prospected bars that averaged three-quarters of a cent to the pan, but water is too scarce just now to render them valuable. In due time there will be plenty. Now there are about 50 inches in the creek, but in the early part of the season it runs 500 inches. It is almost certain that big pay diggings will be found on People's Beaver and other creeks. Just before I left I learned that two bits to the pan had just been got out of Rocky creek, and it is probable that by this time another district has been organized there, which may be better than ours—which is to be known to the world as the Little Alder mining district of Choteau county, M. T. Some old-time miners in camp think it will be a rival of the famous Alder gulch." In further conversation, Frank said they found near the mouth of the gulch a pit, 100 by 150 ft, that had evidently been sluiced out years ago, and he is of the opinion, concurred in by many others in the gulch, that it was here Chris. Keyes struck it in 1864, to which place he was on his way when killed the following year.

NEW MEXICO.

STRIKE.—Silver City *Enterprise*, Sept. 5: We are informed by a gentleman just in from Fleming that an important strike has been made upon the Rob Roy claim of the Bonanza group. A force of men was put to work upon the mill on Monday by Mr. Hadley, and he has been rewarded by the uncovering of ore that is said to be very rich.

J. W. Fleming and Matt France departed for the Swisshelm mountains on Wednesday to examine the property of Messrs. Fleming, Clark and Sherwood. If the property proves to be what it is represented by the owners, Mr. France will take the mine and make it a producer in as short a time as possible. Mr. France is a man who will benefit any camp he becomes interested in. He represents the stuff that will bring out any camp, and is an excellent judge of mining property.

A. K. Rutter came in from Gold gulch on Wednesday with some of the ore from the Young Man mine that has been opened up within the past two weeks. The ore is of a different character from that on which the large open cut is being driven, being a decomposed black quartz running upwards of $400 in silver. Two feet of vein matter has been stripped for 60 feet, and several shafts have been sunk to determine the extent of the ledge, but all the openings show that it does not vary much from the above width.

UTAH.

REVIEW—Salt Lake, *Tribune*, Sept. 12: The receipts of ore and bullion in this city for the week ending September 10th, inclusive, were, $128,623.36 of bullion, and $3,200 of ore; total, $130,823.30. For the week previous the receipts were: $118,853.48; of ore, $7,850; a total of $126,708.48. The receipts from the Horn Silver for the period last named were twenty-one cars of bullion, $62,000. This brings the total product of the Horn Silver to date for this year up to $1,731,000. The Ontario shipments during the week were fifty-six bars of bullion, valued at $37,832.89. Total product for this year to date, $1,105,900.53. The product of the Hanauer smelter, during the week, was three cars of bullion, $16,700. John A. Daly struck the (Ontario) vein in the Daly ground, with the vein running from the 600-foot station of the shaft, at the time he struck the last new water. The ore is similar to that found in the vein further east, and assays from one hundred to twelve hundred ounces. The galena goes 165 ounces, like that of the Ontario and the Parley's Park; zinc blende about 40 ounces; fahlore—a combination of antimony, arsenic, copper, sulphur and silver—four or five thousand ounces. Prof. Morton at Bingham is having difficulty in applying the leaching process to the Northern Chief ores on account of lime in them, which by roasting becomes burnt lime and destroys the virtues of the solution. If the ores could be treated without roasting, the lime in them would not be deleterious. It is hoped that some remedy may be found for this trouble, which, it is understood, is all that stands in the way of the success of the Northern Chief mill. Russell's leaching process is in use on the tailings of the old Leeds mill.

WASHINGTON TERRITORY.

CLE-EL-UM.—Cor. Kittitas *Localizer*, Sept. 3: Cle-el-um district is situated about 50 miles north and west from Ellensburgh, Kittitas county, W. T., near the headwaters of the Teanaway, Fortune, Arsycle and Engle's creeks, and northeast of Cle-el-um river. The country rock is composed of serpentine, shale, porphyry and granite schist. Its general course is north and west, the mineral belt being a break or spur from the main Cascade mountains, and lying on the eastern slope of the main range, and south of Mt. Baker, covering an area over 60 miles in length, and well supplied with both wood and water for prospecting and mining purposes. The principal mines crop out on the south and west side of the mountains in which they are situated. The outlet to the mines is as good as any one could wish for. The Bullion Company's copper mine is at a depth of 65 ft, and has improved wonderfully. The owners are well pleased, and are sinking their incline as fast as possible. They have had ore continuous for the last 40 ft. They have about ten tons of ore on the dump that is worth on an average over $200 per ton. The Tacoma Co. has not been so successful; they have had the misfortune to employ men, claiming to be miners, who did not know a piece of bed-rock from quartz. The mines are now all looking well, and I think at no distant day we shall be able to show to the outside world that there are good paying quartz mines—gold, silver and copper—in Washington Territory.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

F. A. HUNTINGTON,
SAW, SHINGLE, AND QUARTZ MILL MACHINERY.

We Call Attention to the Following Testimonials as to the Capacity and Durability of the Centrifugal Roller Quartz Mill:

SAN FRANCISCO, Dec. 27, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—DEAR SIR—The four-foot Centrifugal Roller Mill, bought of you in August, 1882, for the Whidden Gold Mining Company, of Shingle Springs, has given entire satisfaction, both on our own and on custom work, saving from 85 to 90 per cent of the gold in the mill. In conclusion I will say that we are so well pleased with it that Mr. Whidden and myself are putting one of the same size on the Tohongo gold mine, near Ravenna, in Los Angeles county.

Yours truly, P. YEASEY,
34 California St., S. F.

FINE GOLD GULCH, Nov. 10, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—DEAR SIR—In reply to your inquiry concerning the working of your Centrifugal Roller Quartz Mill, I am pleased to say that I run one of them for seven months, doing custom work on different varieties of rock, and that the mill gave satisfaction in every respect, and did all that you claim for it.

Yours truly, BYRON JENNINGS.

GARIBALDI MINE, Dec. 17, 1883.

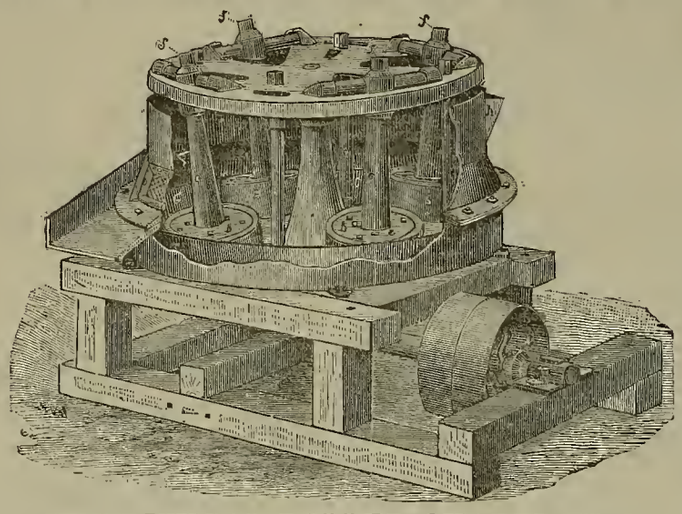
F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR—In reply to yours of the 10th inst., I take pleasure in assuring you that your Centrifugal Roller Quartz Mill gives entire satisfaction, and I can heartily recommend it to mining men who want a cheap and efficient crusher.

Yours truly, E. I. PARSONS, Supt.

32 WASHINGTON AVENUE,
SAN FRANCISCO, Dec. 29, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR: Having run one of your Centrifugal Roller Quartz Mills on sample lots of rock from more than twenty different mines, I must say that in every instance it has given the best of satisfaction in every particular; and I recognize its superiority over any other mill manufactured.

Very truly yours, D. O. MOWRY.



CENTRIFUGAL ROLLER QUARTZ MILL.

The work done by the Centrifugal Roller Quartz Mill, during the past two years, on various mines and different kinds of rock, PROVES ALL THAT IS CLAIMED FOR IT, viz.:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use; all of which any practical miner will comprehend when seeing it in operation.

SONORA, CAL., Dec. 1, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR:—In reply to yours of recent date, inquiring about the Centrifugal Mill which I bought of you, I will say that I have run the mill four months on hard rock; and I take pleasure in adding that the mill has in every way given the best of satisfaction.

Yours truly, J. H. NEALE.

GARIBALDI MINE,
Calaveras Co., Cal., Dec. 17, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR:—In answer to your inquiry concerning the working of the five feet Centrifugal Mill, bought of you for the Garibaldi mine in Calaveras county, I take pleasure in saying it gives entire satisfaction in every respect, and I only regret that the mine does not warrant the purchase of more of them and the continued use of the one now in operation.

Very truly yours, O. B. SMITH.

F. A. Huntington Esq., San Francisco, Cal.—DEAR SIR—Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Co. property at Shingle Springs, El Dorado Co., Cal., about four months, and it has done good and satisfactory work, a greater proportion of gold remaining in the mill than in the stamp battery. FRED JONES, Supt.

HILDRETH RANCH, Fresno Co., Cal.,
January 11, 1884.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR—In regard to your mill (Centrifugal Roller), I have crushed about 500 tons of rock in the mill, and am glad to say that it has given entire satisfaction, and can recommend it to the public as the most expeditious and least expensive method for crushing and milling ore that I have ever seen. Truly yours,

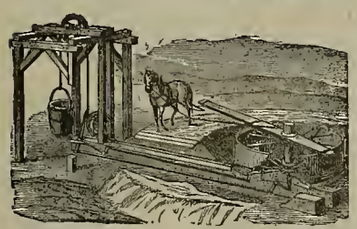
THOS. HILDRETH.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE. CAPACITY AND DURABILITY GUARANTEED

F. A. HUNTINGTON, 45 Fremont St., San Francisco.

☞SAMPLE LOTS OF ORE WORKED.☜ ☞WHERE A MACHINE CAN BE SEEN IN OPERATION.☜

MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

Mining Share Market.

The fact that they have commenced cross-cutting in Hale and Norcross did not seem to help the price of the stock to any extent. The stock market generally has been rather slow, and it appears hard to give it any sort of a "lift." On the Comstock, at the north end, the deep winze in Mexican is now below the 3300 level and the sump is completed and the work of cutting out a station commenced. Next in order will be the running of a west cross-cut at the great depth of 3300 ft below the surface. In the old bonanza mines a drift is being run north on the 1700 level to explore a section of ground lying north of where the bulkheads were built at the time of the breaking out of the fire in the old timbers. At the Chollar and Potosi work has been discontinued on the 2800 level and the sinking of the Combination shaft has been resumed. The shaft will be sunk to the 3000 level as rapidly as possible, when a new hydraulic pump will be put in at that point. This will give the finest system of pumping to be found in any mine in the world.

Bullion Shipments.

Hale and Norcross, Sept. 13, $8,339; Niagara, (Shasta Co.), 5, $16,000; Green's mine (Shasta Co.), for August, $3,500; Baltimore and Victoria (Wood River), 10, $1,454; Paradise Valley, 8, $8,918; Hanauer, 13, $9,430; Wood River, 13, $2,000; Horn Silver, 13, $9,000; Ontario, 13, $5,166; Horn Silver, 14, $6,000; Ontario, 14, $4,978; Vienna, 14, $3,167; Hanauer, 10, $9,000; Horn Silver, 11, $9,000; Ontario, 11, $6,613; Day, 12, $4,435; Baltimore and Victoria, 12, $1,938; Horn Silver, 12, $9,000; Ontario, 12, $5,236; Vienna, 12, $3,166; Navajo, 15, $12,250; Bonanza King, 10, $10,263; Belmont, 9, $2,408; Grand Prize, 15, $6,000; Bonanza King, 13, $18,343. During the week ending the 13th inst., 47 cars of bullion, weighing 1,237,153 pounds, 24 cars of ore, weighing 766,830 pounds, and one car of white lead, weighing 20,056 pounds, were shipped out of Utah.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

FRANKLIN COAL M. Co., Sept. 8. Location, Washington Territory. Capital stock, $250,000. Directors—Wm. Norris, Jno. D. Fry, E. W. Taggard, E. W. Sells and Sidney V. Smith.

GENERAL SHIELDS M. Co., Sept. 10. Capital stock, $15,000,000. Location, Safford district, Eureka Co., Nevada. Directors—George Hearst, A. E. Davis, Peter Hopkins, W. T. Wiggins and E. J. Swift.

CONSOLIDATED EXCELSIOR M. Co., Sept. 10. Location, Trinity Co., Cal. Capital stock, $5,000,000. Directors—P. A. Wagner, John Wagner, W. F. Perry, Frederick Getchell and Henry Boyle.

PHYSIOLOGICAL OPTICS.—A science of a very recent date, in the doctrine of the anomalies of refraction and accommodation, the connection between science and practice is more closely drawn together than in any part of medicine. Many an obscure type of disease emerged into the clearest light, and assumed, as if spontaneously, an elegant simplicity. Prof. Donders, page 329, remarks how necessary a want of knowledge it is to the correct diagnosis of the various defects of the eye, and how deeply it affects the whole treatment of the oculist, will come to the sad conviction that an incredible number of patients have been tormented with all sorts of remedies, and have been mutilated by inappropriate operations, who would have found immediate relief and deliverance in suitable "spectacles." C. Muller, the Optician, 135 Montgomery street, advises parents having children complaining of their eyes, subject to inflammation, headache, deviating in or out, as the case may be, to call. He will explain the cause and remedy of all such difficulties, very often the means of saving the loss of sight of the deviating eye, sure to follow physical exclusion. All complicated cases of defective vision thoroughly diagnosed free of charge. Every possible combination of lenses mounted in two hours notice. Correcting all errors of refraction and accommodation in simple or compound astigmatism, belonging to Myopia or Hypermetropia and Presbyopia, the result of advancing years. 3

A PLEASANT RECEPTION.—A reception was given last week at the residence of Mr. and Mrs. George H. Strong, in Oakland, on the occasion of the fifteenth anniversary of their marriage. As usual on the occasion of a "crystal wedding," the presents made were all of glass, and many of them were of beautiful and novel design. Mr. and Mrs. Strong's new residence was tastefully decorated, and their numerous friends passed a very enjoyable evening in social intercourse, with music and recitations. Mrs. Strong received many compliments for the handsome appearance of the supper table, decorated as it was with beautiful glass of varied design and color, and a test of the edibles proved her skill as a hostess. Mr. Strong has been a partner and manager of Dewey & Co.'s Patent Department for many years, and it is a matter of congratulation among all his associates and friends that the recent anniversary should have been passed in the midst of health and plenty.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

AFTERNOON SESSION.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento Co.
A. C. KNOX—Nevada (State.)
B. W. CROWELL—Fresno and Tulare counties
GEO. MCDOWELL—Plumas and Sierra counties.
WM. PASCOE—San Francisco.
WM. H. COOK, Los Angeles Co.
H. G. PARSONS—Idaho and Montana.
G. W. IOALLS, Arizona.
H. A. BEATON—Washington Ty.
L. L. WOODMANSEE—Oregon.
J. C. KOOP—Napa Co.

Red Canyon Quartz.

EDITORS PRESS:—Some very rich gold quartz was recently brought into Genoa from Red Canyon, Douglas county, Nevada, a full account of which has been promised in a short time for your columns by one familiar with the rock and the district. About 35 miles from Carson City, on the wagon road to Aurora, Mr. Holbrook, of the Mountain House, and others, are opening up some promising claims in Silver Glance district. The Orpheus mine, the property of Messrs. Willard & McDonald, has thus far paid all expenses, and, as will be seen, the developments are by no means inconsiderable, with a tunnel 140 feet in length and an incline on the lode of at least as many feet, besides other work. The mine is in a porphyry formation; width of lode averaging about 18 inches; ore free-milling gold quartz, the best working from $150 to $250 per ton; the poorer averages from $25 to $30. K.

Genoa, Douglas Co., Nev.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

MR. L. L. WOODMANSEE has gone on a trip through Oregon in the interests of this paper. The editors and publishers will feel greatly obliged to all friends who may assist him in obtaining information and subscribers. Mr. Woodmansee is an experienced canvasser, who has formerly traveled for this firm in the interests of the journals published by it, and will send such notes as he gathers for publication.

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufacture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.
2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough oil to prove what we say. Our oil has now been adopted as

Cheaper, More Economical, and More Serviceable than any other Oil

On the Central and Southern Pacific Railroads, the Northern Pacific, South Pacific Coast, and North Pacific Coast Railroads, the Oregon Railway and Navigation Co., Pacific Coast Steamship Co., and all the prominent Iron Works, Saw-mills, etc., on the Coast and Puget Sound. ADDRESS:

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco

A Plain Book on Assaying.

"ASSAYING GOLD AND SILVER ORES"—By C. H. Aaron—Is a new work published by Dewey & Co., which is intended by its author to be available for the use of miners, prospectors and others who only care to know how to assay gold and silver ores.

The author of this work is well known in the mining regions of the Pacific coast as a practical metallurgist of many years experience. His writings for the press and his two previous works ("Testing and Working Silver Ores," and "Leaching Gold and Silver Ores") have shown his ability as a writer. The little book is plainly and simply written, more especially for the use of those persons not familiar with chemistry. No symbols are used, everything being plainly stated and clearly described. The scope of the book is shown in its table of contents as follows: Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables. These assaying tables give simple directions for figuring out results. This is the simplest, cheapest and most easily comprehended work on assaying yet published. The volume comprises 106 pages, with illustrations, and is well bound in cloth. The price is $1, postpaid. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS office, San Francisco—1884.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION.

(Of the City of San Francisco)

PREMIUMS AWARDED.

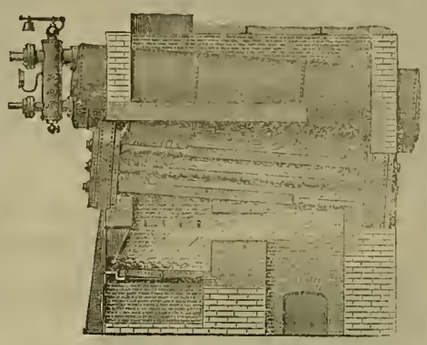
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, MO., Sept. 26, 1883

Messrs. Adolphus Meier & Co.—GENTLEMEN. We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER BUSCH BREWING ASS'N.

OFFICE OF SUPT OF ROYAL RAILWAYS,
BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 24, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

A Great Triumph!

WON BY THE MANUFACTURERS OF THE

EUREKA CEMENT,

GOULD & HILL, Proprietors,
103 and 105 Fremont St., San Francisco.

On the 25th day of August, 1884, Judge Sabin, of the United States Court of Equity, decided the great infringement case of the Salamanda Felting Company of New York and Philadelphia vs. the EUREKA CEMENT, in favor of the EUREKA CEMENT. This decision is one of the most important that has been rendered for many years, because it gives Messrs. GOULD & HILL the unrestrained right to continue the manufacture of the BEST COVERING FOR STEAM BOILERS AND PIPES that is known to the world.

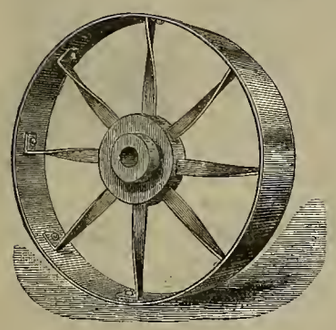
MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE

Cheapest and Most Effective Machine

OF THE KIND NOW IN USE.

Adapted to All Grades and Classes of Ores

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coaser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.

To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

VOLUME XLIX. Number 13.

The Big Alaska Quartz Mill.

We give on this page and page 197 engravings of the new mill of the Alaska Mill and Mining Co., which is about to be erected on Douglas island. The plant is one of the most complete ever built in this country, comprising as it does every improvement in quartz mill machinery. The mill was designed by the company's superintendent, Mr. John Treadwell, and built by the Risdon Iron Works, of this city. The machinery was shipped a few weeks since to Alaska, and the men are by this time engaged in setting it up, preparations for the reception of the machinery having been made during the summer.

The mill is designed for the reduction of gold ore carrying sulphurets and free gold, and has 120 stamps of 900 pounds each, with a crushing capacity of 360 tons per day.

As will be seen, the batteries are arranged in two lines, setting back to back, with the ore bins between, on the top of which are three 9-inch by 15-inch Blake rock breakers, and six 5 feet by 10 feet grizzlies. In front of the batteries and in the battery-room are copper-plate sluices, and in front of the battery-rooms and below are the concentrator-rooms. In the battery-rooms, in convenient positions, are placed the cleaning-up pan and amalgamating barrel. At the end of the concentrator-room the water-wheels for driving the machinery are placed, the whole arrangement being designed to make the mill as nearly automatic as possible, in order to save labor in running expenses, which is a very important item in a country where labor is dear, like Alaska.

The machinery is designed and constructed for durability, and with all of the latest improvements, with steel cams, tappets, shoes and dies. The mortars are made of an improved pattern, weighing 6,000 pounds each, with cast-iron linings arranged specially for the amalgamation of free gold. The stamp-stem guides are made with cast-iron frames, arranged so that any one stamp can be removed without disturbing the others, each stem being guided and held in place by separate maple blocks. This will save very much time and expense in repairing and replacing stamps.

Each battery of ten stamps is driven from the line-shaft by an improved friction clutch pulley, so arranged that each ten stamps can be started and stopped at pleasure. They are fitted with phosphor bronze bushings, and accurately balanced so that there is no tendency to "wobble" or wear out of true.

The motive power is furnished by two hurdy-gurdy water wheels—one of Pelton's patent and the other of Knight's. They are each 6 feet in diameter, and run at a velocity of 236 revolutions per minute; the power being transmitted by twelve hemp ropes 2 inches in diameter, running over grooved pulleys 12 feet in diameter. Either one of the water wheels is of sufficient power to drive the mill.

As the method of driving the machinery is novel, we shall give further illustrations next week, and describe more fully this portion of the machinery.

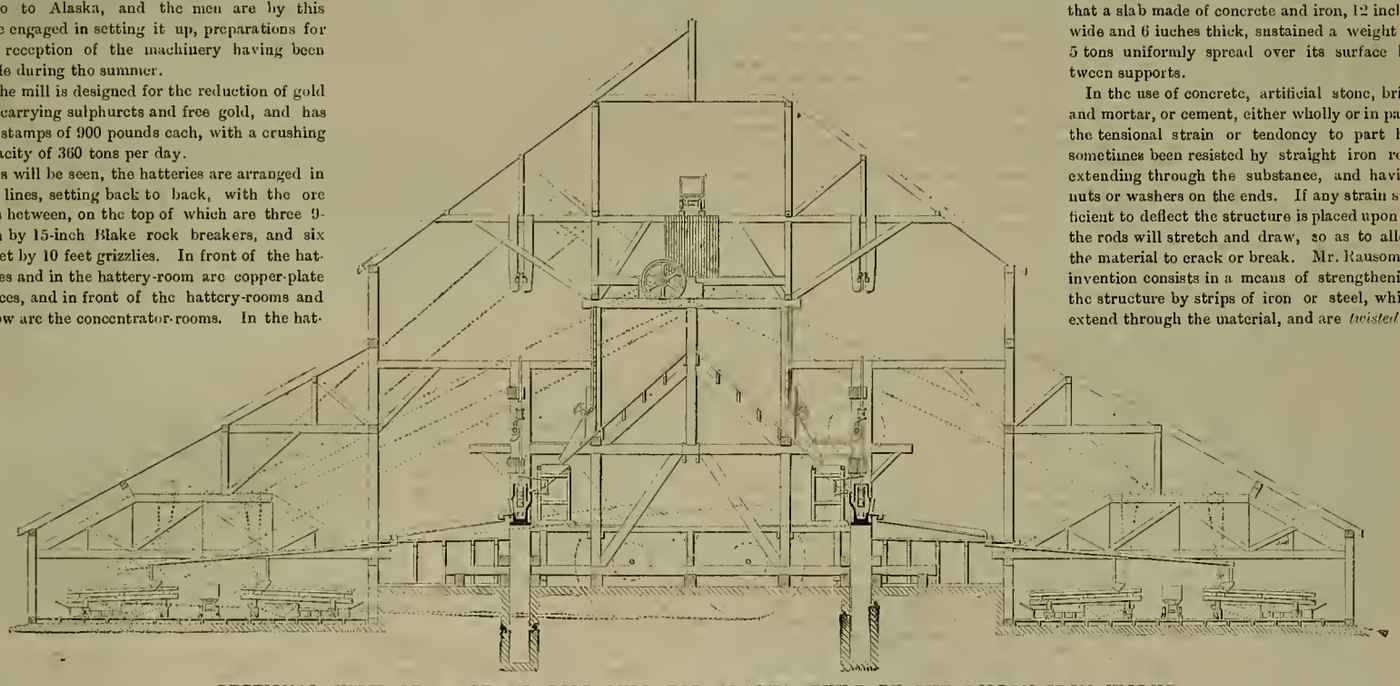
The ore is taken from a tunnel in the side of the mountain and run into the top of the mill, which is on a level with the mouth of the tunnel; here it is dumped and goes through the grizzlies and rock breakers into the ore bins, from which it is drawn out directly into the ore feeders, which feed it into the batteries, where it is crushed wet and amalgamated for free gold. From the mortars the pulp is taken over copper-plates, where any free gold which may escape is amalgamated. Then from the copper-plates it is taken to, and passed over the Frue concentrators, which save the sulphurets and the tailings, and sluiced off. From the concentrator room the sulphurets are taken to the chlorination works (which are not illustrated in the cut), where they are treated for the gold which they contain by the chlorine gas.

Some idea of the magnitude of the plant for concentrating the ore may be inferred from the fact that 48 Frue concentrators were purchased for the mill from the agents in this city. This is the largest single order the Frue agents ever received, and the largest number of concentrators in any mill in the world. This is a most substantial recognition of the merits of this machine, to which the mining industry of the country is specially indebted for the successful and economical treatment of gold-bearing sulphurets. These concentrators are arranged in double rows in the concentrating room, for economy of space and attendance.

The San Francisco Plating Works furnished for this mill 1,400 square feet of silver-plated amalgamating plates. Some of these plates are 4x4 feet and some 2x2 feet; the mortar plates are 6x48 inches. This is the largest single order, with one exception, that Mr. Denniston ever received.

The mill will be illuminated by several powerful electric lights, which will diffuse sufficient light to enable work to be carried on with the same facility in the night as in the day time.

The contract called for this mill to be finished in 60 days, but the Risdon Iron Works completed it in less than 50 days. The Alaska Mill and Mining Company is composed of some of the most prominent business men of the Pacific coast. James Freeborn is the president of the company. Col. J. D. Fry and Senator John P. Jones are stockholders. John Treadwell, who is renowned for his executive ability and energy, is the superintendent.



SECTIONAL VIEW OF 120-STAMP GOLD MILL FOR ALASKA, BUILT BY THE RISDON IRON WORKS.

New Form of Building Construction.

Mr. Ernest L. Ransome, of this city, has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a new form of building construction, which he is applying at several places in San Francisco. It is essentially the strengthening of concrete, artificial stone, or similar material, by the use of iron. The roof of the new fire-proof warehouse now being made by Mr. Ransome will be built with this construction. Experiments have demonstrated that a slab made of concrete and iron, 12 inches wide and 6 inches thick, sustained a weight of 5 tons uniformly spread over its surface between supports.

In the use of concrete, artificial stone, brick and mortar, or cement, either wholly or in part, the tensional strain or tendency to part has sometimes been resisted by straight iron rods extending through the substance, and having nuts or washers on the ends. If any strain sufficient to deflect the structure is placed upon it, the rods will stretch and draw, so as to allow the material to crack or break. Mr. Ransome's invention consists in a means of strengthening the structure by strips of iron or steel, which extend through the material, and are *twisted* so that they are fixed within the material at every point from end to end, and a rigid bond is thus formed throughout the entire length, the tendency of the iron to stretch or draw being resisted at every point in its length.

The concrete or artificial stone structure has the rods put in before it becomes solid from the plastic state. When there is any strain and tendency to deflect, the tensional strain brought upon it may reach the point of rupture. If straight rods or ribbons extend through, they often crack, as their even size allows them to slip within the structure. Mr. Ransome's rods or strips being twisted, by their spiral shape they form a bond or tie at all points, from end to end, within the material through which they pass. The principal advantage arises from the bond which is formed at every point by the peculiar shape of the rods or strips. Repeated experiments with different forms of rods show this spiral or twisted form to be best adapted to the purpose required.

SALE OF MEXICAN MINES.—A dispatch from Guaymas, Mexico, says: One of the most important sales of mines has just been concluded at Magdalena, through our Consul, A. Willard. The property sold is the Trinidad mine, and land in the Tahecripi district, and the Bronces, with coal lands in Ures district. The purchaser is James T. Browne, of Browne Bros. & Co., bankers, London. Alex. M. Womble was mainly instrumental in engaging English capital in this purchase. The price to be paid is $1,500,000 in gold, on or before January 1, 1886. There are no less than fourteen miles of tunnels and drifts on this property, and it is the largest mine in Mexico. Work on it will be immediately commenced.

A GREAT amount of prospecting is being done about Sweetwater. In that vicinity is a very extensive mineral belt. Of late several good strikes have been reported.

WORKING TAILINGS.—D. W. Johnson and John Boyer, both practical mill men, have purchased some 60,000 tons of tailings from Booth & Co., owners of the Arizona mine, at Unionville. The purchasers have also bought the two quartz mills owned by Booth & Co., and will go to work immediately to get them in order to work the tailings.

Support Your Own Mechanics and Manufactories.

The citizens of Denver, Colorado, are taking a lively interest in the support of their home manufactories. This is as it should be, and we congratulate the mechanics and manufacturers of that city that her citizens have a just appreciation of the value of encouraging and building up home industries. They have come to a very general determination not only to patronize their own manufacturers but also refuse to patronize such of their home dealers, as refuse to place upon their shelves, or in their warehouses, the goods that are produced at home. These facts, as the Denver *Journal of Commerce* truly says, speak well for the patriotism and good business sense of the people of that city.

This disposition is worthy of emulation by our own citizens—not only of San Francisco, but of the whole State as well. It is a good policy for adoption by city, State, or nation. It is the only way in which thriving and prosperous communities can be built up. Transportation of goods from one place to another in which goods of an equal quality and at essentially the same price can be produced, creates no values. It is labor lost, in fact, it is labor worse than lost. It is a suicidal policy; for the inevitable result is to decrease the volume of business at home, and swell that at some other place at the expense of your home industry upon which your own, and every other family in your neighborhood, depends. Every dollar spent at home, instead of being sent abroad, helps the trade of your neighborhood that much—it passes from one dealer to another and thereby increases the volume of local business.

There will necessarily be certain locations peculiarly calculated for certain lines of production—that is well; but all cost of transportation beyond the necessity thus created is lost labor, because if not thus employed it would be devoted to creating values and thereby increasing the general aggregate of State and national wealth.

It is gratifying to see the interest that has sprung up of late in this city and throughout the State generally on the subject of home manufactures. There are a large number of new enterprises which of late have been started or for which active steps are in progress. Among these may be mentioned several new lines of iron manufacture, a new line of glass work, jute, cement, cotton, India rubber, etc. The Manufacturers' Association is an organization from which much good in this direction may be expected; also the "Millers' Association of California." Through these associations and in other ways, the subject of home manufactures is being brought more prominently before the public. The Chamber of Commerce, the Manufacturers' Association and the Board of Trade have each appointed a committee of three to act in concert to discuss the business outlook in this city, and to procure an active co-operation of the business community in devising and carrying out methods for the revival and increase of our domestic trade and industries. This is a most excellent move in the right direction and by the right men. The committee have had several meetings, a part of which have been held in private. All that has thus far transpired is that the committee mean business, and that active steps will be taken to further the ends in view.

The press, generally, is also doing much to awaken our people and impress upon capitalists the value and importance of establishing new branches of industry in California, and enlarging the facilities of those already in operation.

There is a much better condition of feeling existing between the employer and employees in this State now than has existed in years past. The former, perhaps, are more liberal, and the latter realize more fully the peculiar condition in which this coast is placed in its efforts to render itself independent of Eastern producers and manufacturers. That class of men who furnish the bone and sinew to keep in motion the wheel of industry are more disposed than formerly to work in harmony with such capitalists as are disposed to invest their money in commendable efforts to build up new and important industries in our midst—industries, the success of which are really of more importance to the mechanics and laborers themselves than to those who furnish the money to carry them on. The man or men who would unnecessarily stir up strife, or force or augment strife between the two classes, are the enemies of both, and deserve the severest censure from better people everywhere.

But the chief object we have in view in penning this article is to impress upon the minds of the consumers of all kinds of produce and merchandise the advisability and importance of patronizing home industry. Whatever capital, whatever energy and enterprise, is put into industries on this coast, is of benefit to all our people, and both, the men who place therein their capital and those who invest their labor and strength, merit the fullest and most unstinted support of the community. They should receive aid and practical encouragement from every person who has a dollar to spend or a dollar's worth of interest in this city or State.

THE introduction of cable cars is now proposed by a Pittsburg railway company.

Mining Outlook in Utah.

A correspondent of the Salt Lake *Tribune* says: Since mining is the principal industry that puts money in circulation in Utah, on which depends the success of our mercantile, manufacturing and agricultural interests, and in fact nearly all the business pursuits of the Territory, our business men and local capitalists should manifest a deep interest in the development of our mineral resources.

As a rule, the business men of a mining region realize the benefits that will accrue to their business by a development of the country's mineral resources, are liberal in encouraging the prospector and miner in their work of development, but here in this city, the metropolis of Utah, where the largest mercantile and manufacturing establishments are located, our business men and local capitalists seem to manifest but little interest in the development of our mineral resources, notwithstanding the fact stares them in face that 90 per cent of the money that circulates in Utah, which enables the merchant to do a profitable business, gives the farmer a cash market for his produce, enables the borrower to pay the loaner an exorbitant rate of interest for the use of money, makes it possible for our local railroads to be operated at a profit, must come from the mines.

We have a few energetic men who are mining on a legitimate basis, a basis of actual values, and they are making a good success.

There are many openings here in Utah for such mining enterprises, and it would be far better for the Territory if such mining was the rule and not the exception.

The continued success of such mining will result in good to the Territory, for capitalists, seeing the fact demonstrated that mining is just as legitimate a business and as safe and profitable as any other under honest and competent management, will realize the fact that mining is a safe investment for capital and will invest liberally in ligitimate mining enterprises.

We have a few incorporated companies that were fortunate in the selection of their management and they have made a grand success of mining. They have developed their properties from mere surface prospects to large dividend paying mines.

Then we have several good mines incorporated, generally limited, that should be making an output of from $50,000 to $75,000 per month that are lying idle, and why? simply on account of incompetent or dishonest management, by which the treasuries of the companies were bankrupted, the share holders becoming disgusted and refused to make further advances to develop and work their properties. A great deal depends on the management of a mining property. We have bad managements in Utah that would bankrupt the Ontario or Horn Silver in six months.

The mining industry of Utah has had many obstacles to contend with. The great majority of the people of the Territory are hostile to it; the railroads have discriminated against it; the hue and cry that property was not safe here on account of the hostility of the Mormous; the numerous frauds and swindles that have been perpetrated by unscrupulous operators on capital that sought investment in our mines, and the systematic blackmailing of good properties; all of these have had a tendency to deter capitalists from investing in our mines. Notwithstanding all these obstacles, Utah has made a good showing. She has produced some $80,000,000 in treasure, which has made it possible to build and operate six or seven local railroads in the Territory; built up and sustained large mercantile and manufacturing establishments, from which large fortunes have been realized; brought this city from a mere country village to a city of large commercial interests, with many of the modern improvements found in larger cities—street railways, telephone, electric light, etc. With the limited number of mines now being worked, we are still making a good showing, for we have a few as good mines as can be found in the Western States.

It is not for the lack of mines that our output is not larger, but the want of a little capital in the hands of honest and competent management. We can't expect Eastern and foreign capitalists to come here and purchase undeveloped mining prospects at what the owners consider their prospective value.

When a man invests his money he wants to see a reasonable probability of getting a remunerative return for his investment; hence, in order to induce capitalists to invest in our mines we must make some developments to demonstrate at least that our mines possess a prospective intrinsic value sufficient to warrant further developments. But how is this to be done? As a rule the men who wear their lives out climbing the rugged mountains prospecting for mines are poor and unable to develop their prospects without assistance.

They naturally look for assistance from those who are to be benefited by such developments, but they look in vain in this penny wise and pound foolish community.

The present stringency in money matters would not be felt so keenly if we had more capital invested in our mining industry producing and disbursing large amounts of money to circulate through the arteries of trade. Something must be done to infuse new life and energy in our mining industry or Utah will soon lose her prestige as a great bullion producer, and some of her short-sighted business men will have to hunt new places to open up business.

I certainly wouldn't advise our business men to invest in all the mining schemes that are floating around, for many of them are of the wildcat species, but there are legitimate ventures offered occasionally indorsed by practical and competent miners that should receive encouragement by a small investment at least to demonstrate to our Eastern friends and English cousins that we haven't lost faith in the mineral resources of our Territory. If our business men and local capitalists would organize a company, under proper management, to develop and partially develop mines that have a prospective value, and demonstrate to outside capital that our mineral wealth is not confined to the few bonanza mines we are now working, but that the mountains are full of them, it would bring capital to Utah, and create a boom such as we never had before. Utah is a good field to operate in, but she needs a few live men to bring her to the front.

The Little Rockies.

From a gentleman who has just arrived from Benton we learn of the intense excitement now agitating that section of the country over the discovery of unprecedentedly rich diggings 135 miles east by north from the river metropolis of Montana. Professional men, merchants, laboring men, sports, gamins and newspaper men gather on the streets and strain their eyes for the coming of the next courier from the scene of the find, or in excited knots discuss the latest arrived bulletins. The citizens of Benton some days ago sent out a committee, consisting of Perry Aspling and Dennis Halpin, to the new fields, who were to report on the exact state of affairs. From them most flattering reports have come, such as a pit 20 feet square and 4 feet deep yielding $300, and a claim some distance from the discovery in which $36 was panned out in one day.

Our informant had an interview with Frank Aldrich, formerly of the Barker district, who had just returned from the new camp for supplies. From him he learned that the new mines were located near the head of Beauchamps creek, a tributary of the Missouri, and the first stream of importance east of Little Rocky creek, the latter emptying into the Missouri opposite Rocky Point. The gulches tributary to the discovery gulch have yielded good prospects, and there are several bar claims, but the amount of water available for the latter is small, although he thinks water could easily be brought in. In the discovery gulch they have at present about 50 inches of water, but in the spring the volume reaches 500 inches.

Near the mouth of the gulch the discoverers found a pit 100x150 feet, which is supposed to have been worked by a miner named Chris. Keyes, who, with a party which he had organized, was killed while on his return to his discovery in 1865. He was sole possessor of the knowledge of the whereabouts of the find, and his secret died with him. Search has since been repeatedly made for his old stamping ground, but until now without avail. The pit in question yields good prospects.

In the gulch were found two channels giving prospects as high as $3.50 to the pan. In the channels are five feet of solid gravel, averaging about a bit to the pan. The ground is not very deep, averaging from four to eight feet, and the locators are jubilant.

Benton is all excitement, and the demand for horse flesh is very great, for everybody, and all their relations, are either making preparations to go or send some one to represent them. —*Inter-Mountain.*

A PAINT MINE.—Mr. George Harmon recently sent in a box of red clayish rock from Willington's which we have had subjected to a preliminary test. It proves to be a formation of wonderfully uniform substance which makes, so far as tested, an extraordinary good body for Venetian red. It is very readily reducible to an impalpable powder, and there seems to be no residuum of gritty substance. Further experiments will be made. We are impressed that the only difficulty is that the deposit is too far away from the seaboard to permit of its introduction in the world's market. Venetain red can be purchased in Carson at about three cents per pound, while in San Francisco it is worth about one and a half cents per pound. The local market is not sufficient to warrant the construction of suitable works for grinding the substance into paint. Were freights at such a rate as to permit of easy transportation of the ore to the Bay, we have no doubt that George could make a handsome income out of his find. —*Eureka Sentinel.*

SETTLING NORTHERN CALIFORNIA.—A movement looking to the settlement of the northern counties of the State has been started and a meeting with that object in view will be held in Sacramento next Tuesday. Among others interested are N. D. Rideout, John Bidwell, W. H. Parks, L. Frear, J. Q. Brown, H. M. Larue, Judge C. C. Bush, General N. P. Chapman, Joseph Cohn, James Montgomery, F. C. Lusk, W. S. Green, J. B. Brown and Joseph Steffins, President of the Sacramento Board of Trade. The idea is to induce immigration into the northern counties and build that portion of the State up, as the southern portion was built.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MECHANISM FOR BALANCING AND SUPPORTING MILLSTONE.—George Summerton, S. F. No. 303,761. Dated Aug. 19, 1884. This invention relates to certain improvements on millstone-irons; and it consists in a novel arrangement and construction of devices, applicable not only to millstones, properly so called, but to any apparatus operating similarly, or designed to supply their place. The patent covers details of construction.

SAFETY GUARDS FOR CARS.—Lewis Peterson, S. F., No. 302,024. Dated July 15, 1884. This safety guard for cars and other heavy moving objects, consists of a combination of devices. The principal object is to prevent such accidents to life and limb as are of frequent occurrence in cities, occasioned by persons being run over by street cars. The safety guard, patented, may be applied to cars and moving bodies of all kinds to prevent any object in front of the car from being run over or injured to any considerable extent.

COMBINED WHIP-SOCKET, OIL-CAN AND WRENCH. Cephas L. Bard, San Buenaventura, Ventura county. No. 304,062. Dated Aug. 26, 1884. This combination is intended for use with vehicles. It consists in a suitable whip-socket, to the lower end of which is secured an oil-can, both socket and can being secured to a wrench, and the whole fitted to the dash-board or other suitable portion of a vehicle. The object of the invention is to so combine the device above mentioned as to form a compact whole, readily adjustable to and detachable from each other and the vehicle about which each of the parts are to be used.

SAFETY CAR TRACK.—Jeanty Denechaud, Sr., S. F. No. 303,131. Dated, Aug. 5, 1884. The invention relates to that class of safety railway-cars in which rollers are projected into or withdrawn from its grooves in the rails by means of adjustable mechanism on the car, to prevent derailment on sharp covers and dangerous places. This patent covers improvements on a safety railway car previously patented by the same inventor. He provides arched arms which carry the rollers and has novel mechanism for operating them. The object is to shape the arms so that in their operation they shall not come in contact with cross-roads, and to provide more practical means for operating them.

WINDMILL.—Egbert B. Saunders and Geo. J. Bentley, San Jose. No. 304,136. Dated Aug. 26, 1884. This improvement in windmills consists of a tubular vertical post with a hollow channeled step in which it rests; a frame cast upon the upper part of the wrought tube, and having upon it the journal boxes of the wheel shaft; a cap for the tube, having a support for the upper arm of the vane and an anti-friction guide for the pump rod; a hollow pump-rod with an arm for direct connection with the crank-shaft by means of a pitman, without the intervention of a vibrating bar, and having a slab in one side to admit the regulating chain; a means for bolding the wheel in the wind, and a novel construction of the wind-wheel.

CULTIVATOR.—Morris M. Estee, Napa City. No. 304,811. Dated Sept. 9, 1884. The novelty in this cultivator lies in the arrangement of the tectb, the side series of which converge to the rear, and are carried by a suitable frame, whose sides likewise converge rearwardly. The attachment of the handles to the rear of the frame, the attachment of the pole to the front, and the arrangement of the crank axles of the wheels, in connection with the frame, are points of novelty included in the invention. The peculiar shape of the frame—namely a divergence of its sides to the front and the location of the pivot or steering wheel at the rear—enables the driver to turn the implement in a very narrow space and easily, while the crank axle by throwing the teeth clear of the ground prevents any accidents to them while turning. Having its wide part traveling foremost, the complete pulverizing of the earth is better insured, because the clods are gathered in and met by the teeth instead of being rolled away outward as with the ordinary cultivators. The divergence of the side series of the teeth to the front is advantageous in enabling the driver to run close to the rows in a vineyard or orchard with safety and accuracy—with safety because of the location of the teeth outside the plane of the wheels, and with accuracy because of the ready guide which the foremost teeth afford by enabling them to see at once how close he can go, determining his distance by said teeth without reference to the succeeding ones. The result cannot be effected when the frame is built in a reverse manner, as is usually the case, because the front teeth being in the longitudinal center of the frame, and consequently some distance from the rows, is an uncertain guide to determine where the most widely separated teeth will run. Having a pole the implement runs steadily and is easily managed, as the tiller enables it to be guided with very little effort.

MECHANICAL PROGRESS.

The Detached Steam Boiler Furnace Fallacy.

It is believed by many engineers that it is impossible to obtain complete combustion nf coal in a furnace surrounded by the heating surfaces of a steam boiler, as in an ordinary internally fired boiler, or oven in the furnace of the common externally fired horizontal tubular boiler where but one side of the furnace is exposed to the boiler surface, the reason advanced therefor being that tho temperature of any portion of a boiler-shell covered with water is so far below that due to the perfect combustion of the fuel that it exerts a chilling influence upon the fire, and prevents complete combustion. This we believe to be a grave error, and we think experience of parties who have tried detached furnaces, or those separated from the boiler and inclosed entirely in fire brick, and in which the combustion was completed before the gases were allowed to come in contact with the boiler-shell, will fully bear out the truth of our statement.

First, let us inquire if the combustion of coal in a well planned boiler furnace is so incomplete as is generally alleged by those engaged in the manufacture and sale of detached furnaces. We think not. The maximum evaporative power of a pound of good coal is in round numbers fifteen pounds of water from and at 212 degrees Fahr. It is no uncommon thing for an evaporation of twelve pounds of water under the above conditions to be obtained per pound nf combustible from a well planned marine boiler. This shows that 80 per cent of the theoretical evaporative power of the fuel has been utilized. If we make allowance for the heat lost by radiation and that passing off in tho escaping gases of combustion, we cannot avoid the conclusion that the combustion must have been practically perfect. Now no such result as the above has ever been approximated by any detached furnace arrangement. In no case that we are aware of has the arrangement given satisfaction. In two cases which have recently come under our personal notice, boilers were set in this manner, and the draught was produced by blowers. In the first case two boilers were provided, and it was always necessary to run them both to do the work. The tube head of one of them was soon ruined, fractured between the tubes, necessitating a new one. At the time the new one was put in, the owners were persuaded to reset their boilers in the ordinary way. After this was done, one boiler did the work very easily, and the consumption of fuel was very largely reduced.

In the other case referred to, a large compound tubular boiler was set in a similar manner. It was found to be utterly impossible to keep the tubes from leaking around their ends. (In both cases the heat passed through the tubes before returning under the shell.) After some persuasion the owners were induced to change tho setting to the ordinary type, when all trouble soon disappeared, and the consumption of fuel was reduced from 5,000 pounds per day to from 2,400 to 3,000 pounds per day. These facts speak for themselves, and we may legitimately inquire, what is the reason for this very great waste of heat in such furnaces? We have not far to look for the explanation. In our opinion it is simply this: The benefit of the radiant heat from the fuel is almost wholly lost.

According to the experiments of Peclet, the proportion of radiant heat from a bed of incandescent coal is one-half of the total heat of combustion. The practical conclusion to be drawn from this fact is that we should always so construct our boiler and arrange the furnace, whether the boiler be an internally or externally fired one, that the radiant heat shall be intercepted so far as possible by the heating surfaces of the boiler. This can be most perfectly accomplished by placing the boiler, as in the marine type. The next best, and one which is without doubt superior to all others for ordinary purposes, is the arrangement found in the ordinary horizontal tubular boiler. By keeping the furnace sides well away from the boiler nearly up to the water line, keeping the bridge wall well down and battering its face, making tho grate rather longer and narrower than is the usual practice, where a given amount of grate surface is wanted, we may fulfill the conditions requisite for economy in a most perfect manner, and a boiler so set will have an evaporative efficiency fully equal to the best internally fired one, so long as the setting is kept in good repair.

It may be argued that in the detached furnace the radiant heat is taken up by the hot gases, and by them brought into contact with the heating surfaces of the boiler, and equally good results obtained, but this is a fallacy. The radiant heat passes through the gases of combustion without warming them, exactly as the sun's rays pass through our atmosphere without warming it. The only way in which the radiant heat can be communicated to these gases is by being previously absorbed by the brick walls of the furnace; this is communicated to the hot gases as they flow over the furnace sides, but its intensity is very much reduced, and consequently the resulting temperature of the gases is much lower when they reach the heating surfaces of the boiler, and the evaporative efficiency is reduced in proportion. The more the principles of the action of heat are studied, the more clearly we shall see the necessity of burning our fuel in such a manner as to produce the highest possible temperature, and of so arranging our furnaces that the source of heat may be as close to the most effective steam generating surfaces of the boiler as it is possible to be and allow the gases chance to properly burn.—*The Locomotive.*

Iron Cars.

The *National Car Builder* says: "It is a common remark, even among railroad men, that iron cars will sooner or later come into general use, in view of the fact that timber is getting scarce and more expensive, and that the supply must ultimately run short. The inventors and advocates of iron cars must therefore bide their time. The committee on iron and steel in car construction, of the Car Builders' Association, in its report of last year intimated that all are of one mind on this subject, but that each is waiting for somebody else to take the lead, that it has taken many years to bring wooden cars to their present excellence, and it should not be expected that iron cars can be perfected all at once.

"One of the most recent devices of iron car construction is that of the Rohbins Cylindrical Car Company, which is something out of the ordinary way in which passenger cars have heretofore been built. The car is designed to supersede the ordinary wooden passenger car now in use. It is constructed of steel or iron and cylindrical in form, which renders it more durable, stronger and better adapted to the constant strain and concussion incident to railroad traffic than other cars. Above and beyond this, it is built with a view to lessen the liability to injury of passengers in case of accident, a need long felt, but not until now obtained. The form and material used are two great factors which enter into the construction of the car to obtain this result, but with them is added additional security to passengers from injury by fire, the furnaces being attached to the bottom of the car, the heat from the same being transmitted by radiation through pipes beneath the floor, and the floor itself. The interior—sides and top—are heavily upholstered and the floor carpeted, so that a fall occasioned by the car leaving the track and overturning will be attended with less serious results than now, with a chance in favor of a person coming out of the wreck unharmed." The car has other features, but we cannot make room for a longer description. It will be a curiosity, to say the least, but whether it will supersede the cars now in use is a question.

A New Barrel Machine.

The *Northwestern Lumberman* of Chicago describes a remarkable machine for the manufacture of tight barrel cooperage stock, now on exhibition in that city. It is the invention of Colonel A. C. Blount, of Pensacola, Fla., who had no practical knowledge of cooperage before he thought out his device. Rough pieces of board go into one end of the machine and come out at the other perfectly formed barrel staves, ready for the truss hoop. The invention is really three machines in combination—the first being for planing, the second for crozing and chamfering, and the third for jointing. The machine may be adjusted to any required size of stave, and then each stave is turned out precisely like the other. For example, in case 50-gallon barrels are to be made, the machine is set for 18 staves to the barrel, and each stave is marked 18 as it passes through, enabling the buyer of a package of staves to pick out 18 bearing that number and put them together in a barrel, regardless of the order in which they come. If other sized barrels are wanted, the machine is set for 17, 19 or any other number of staves which may be desirable, and the result is similar. The capacity of the machine at a medium speed is said to be 6,000 staves in ten hours, or, in case of 50-gallon barrels, 333 complete barrels each day. It is thought that this improved machinery will revolutionize the cooperage trade.

A REMARKABLE LOCOMOTIVE.—There has just been completed in a railway machine shop at Wilkesbarre, Pa., a locomotive which it is expected will be able to pull a train on the New York division of the Lehigh road at the rate of eighty miles an hour. The great speed claimed for this engine is attained by constructing the cylinders with the steam and exhaust entirely independent. This is done by using fewer plain slide valves (known as gridiron valves) on each cylinder. The valves are worked by a peculiar arrangement of valve gear, in which the motion is taken from the connecting rod, and working entirely on true centers, there being no sliding surfaces; the steam valve being independent of the exhaust, and vice versa, any point of cut-off or expansion can be obtained without the corresponding back pressure and over compression, as in the link motion.

THE MILLS OF OLD AND OF THE PRESENT.—In former times millers worked mainly with their hands, with just sufficient intervention of their heads to keep their hands out of harm's way. Now, however, it is the head that is mainly required, and while hand-work is still a necessity, brain work is the chief thing under the new conditions of the trade.

SCIENTIFIC PROGRESS.

Oxidizing Influence of Light.

Manufacturers of glass have striven to produce in this country a glass which for strength, purity nf color, and general luster would equal that made in France, England, and European countries; but thus far we have been unable to manufacture glass that would retain its color; after a time the best made would darken and show unmistakable traces of iron presence. For a long time it was thought that the sand used was so mixed with Ferric oxide that the color was directly traceable to this source, but after repeated trials with acids to remove the last trace of iron, and then cast into plates with the utmost care, the trouble was nearly as great; hence some other source, probably gas, must be the cause, for white glass all becomes more or less discolored after a time under the influence of gas. A building containing windows made exclusively of the best American plate was found to give the poorest light, after a time, in those portions where gas was used to the greatest extent, while in other portions where the jets were seldom used no change was manifest.

The more common colors noticed in glass is violet and green, the cause of which nearly all have advanced some theory, but after protracted study and experiment the following is given as the most plausible theory for the result:

The materials out of which glass is generally made in this country are to a very great extent ferruginous and susceptible of coloring the glass a deep green by means of this iron in the form of protoxide, a form generally met with when present; we have used the protoxide of manganese for the purpose of neutralizing its effects with variable success; the action of this mineral, it is superfluous to add, is to transform this protoxide into an oxide, the result being a yellowish red discoloration. Again this green color is partially annihilated by the complimentary violet which the oxide of manganese gives. It is the consequence of this coloring property that the name of pyrohcrite has been given to protoxide of manganese. It is scarcely likely, however, that the necessary respective of oxide of manganese and of oxide of iron are rigorously observed. If on the one hand, the manganese predominates, the glass has a violet shade; on the other hand, if a quantity of protoxide of iron is present the cast of the glass will be green.

Finally, if all the manganese is reduced to a state of protoxide, the glass is colorless, and the influence of light and air may determine at length a partial oxidation of the protoxide of manganese, and as a natural consequence, according to the rules of modern chemistry, a violet color will ensue and increase with the protracted action of light, especially that from gas jets.

Solar Explosions.

Faye rejects, as fabulous, the velocities of 100 or 150 leagues per second, which seem to be indicated, at the sun's surface, by the prodigious rapidity with which the protuberances are formed, and the partial displacements which are observed in the hydrogen lines. He suggests the great probability that hydrogen, when escaping rapidly into the rare medium which surrounds the photosphere, is at first chilled, on account of its enormous dilatation, and becomes invisible to the spectroscope. Afterwards, under the action of solar radiation, it is reheated in various places, so as to be seen by our instruments. An observer, who should return after a half hour's interval, to contemplate the phenomenon, would find the protuberances wonderfully enlarged, without the hydrogen having been required to transverse enormous spaces in the meanwhile.

Father Secchi saw small isolated clouds, forming and growing simultaneously without visible connection with the chromosphere, apparently in the same way as the clouds which are formed in our own atmosphere, from the vapor which already exists in the air, but which is latent and remains invisible, until a local cooling, or a change of pressure, determines its condensation.

Thollon contends, however, that the velocities which are indicated by each of these phenomena are qualities of the same order, and that their maximum value corresponds to the cometary velocities in the same region. Every movement of luminous matter, which approaches us or recedes from us, undoubtedly produces a displacement of spectral lines. No theory indicates, and no fact demonstrates, that any other cause it fitted for producing the same effect. It is, therefore, very natural to consider such displacement as an indication of movement.

Electrical Notes.

A new conductor of electricity just out is provided with a series of parallel grooves and protected hy an insulating sheath. It is based on the principle that the electric current passes along the surface of the wire and not through its substance, and that the insulating material operates to impede and diminish the force of the electrical current in its passage along the surface.

A French chemist has found that, under certain conditions, an observation of the electric resistance of water seems to supply a delicate test of its purity.

The inventor of an electric apparatus for deaf people claims that no ear is so dead that it cannot be made to hear, and that in many cases the apparatus will cure deafness. It may be concealed in a cane, umbrella handle, fan or any such article of convenience.

Portland, Oregon, will shortly be lit by electricity. The initiatory plant consists of three fifty-light United States dynamos driven independently by three Westinghouse automatic engines of 65 horse power each, which will also on occasion each drive an additional twenty-light dynamos.

The city of Brussels means to try the experiment of using electricity to drive its street cars in good earnest. One line—that on the Rue de la Loi—is to be equipped with motors, and separate accounts to be kept, in order to ascertain definitely the cost of the running, as compared with the use of horses. The test is to last one entire year, and then, should the result warrant it, electricity will be employed exclusively on the street railways of Brussels.

A New System of Telegraphy.

Signor Michela, an Italian, has devised a new system of telegraphing, known as the stenotelegraph, by which words may be transmitted with far greater rapidity than by the present system. The aim of Signor Michela is to telegraph by means of a key-board instrument any speech, no matter in what European language, at the same speed as it is delivered, or at the rate of 10,000 words in an hour. This apparatus has been in use in the Italian Senate, and an account of which has been written by M. Cassagnes. It works on the phonetic scale, and depends mainly for its success on the ability which the inventor has disclosed in grouping into series, and representing by combinations of signs all the phonetic sounds emitted in any language. As soon as the operator hears the words he divides them into sounds, and prints their graphic representations in short horizontal lines on a paper band. That is a stenographic record, but also at the same time the signs are being printed on the paper they may be telegraphed to a distant station.

The machine consists of two parts—the printing mechanism and that for the automatic forwarding for the paper. The latter is of no special character, but the printer consists of two key-boards having ten keys each; these keys press on twenty studs, which are by a system of levers connected to as many styles, which carry the signs or characters to be imprinted on the paper. It is stated that a skilled operator can take down with this apparatus 200 words per minute in any language he knows. For something like three years, it is reported, the system has stood the practical test, so far as stenography is concerned, and now the machine has been connected electrically with an apparatus for transmitting the signals to a distant station as fast as they are made, so that, if the receiver can translate the steno-telegraphic signals with rapidity, a speech might be read at the distant office as fast as the speaker himself delivers it. Without details of the mechanism, it is sufficient to explain that each key may be considered a true Morse key, and the board therefore represents a set of 20 Morse instruments, which, combined according to Michela's stenographic method, give a transmitting speed much higher than that of any existing telegraph.

THE VAPORS OF WATER AND NAPHTHA.—It is asserted that hy mixing the vapors of water and of naphtha at the temperature at which steam is produced the hydrogen in both is set free ready to be used in producing the most intensely hot flame known to science. How hot it is may be judged by the fact that while one pound of alcohol has a heat making power, say equal to 9, hydrogen has a heating power equal to 47—more than five times that of alcohol. While it is admitted that as much energy is required to separate the hydrogen and oxygen in steam as is produced by their combustion, it is claimed that a large part of this energy manifests itself in a different form from that heat—probably in the chemical process by which carbonic oxide is formed.

A NEW MICROTOME.—Prof. King has recently invented a microtome or an instrument for cutting vegetable or animal sections, but especially intended for vegetable histology. It gauges to one two-thousandth of an inch, and works with great precision and rapidity. The professor is now engaged in cutting the sections of the genus pinus, of which there are fifty-nine known species in North America, for the purpose of determining the species. This work is done for Prof. Sargent of Harvard College, who is the supervisor of Arnold Arboretum, Brookline, Mass. The sections are generally cut one one-thousandth of an inch thick, bleached, stained in two colors, and mounted, according to new methods of his own invention.

GAS FROM SAWDUST.—Deseronto, Canada, is lighted by gas made out of sawdust. It is claimed that the works show a product of 300,000 ft of gas out of 30 tons of sawdust at a cost of $106, with hy-products, of an aggregate value of $101, making the net cost of the gas 85, or 1.66 cents a thousand feet.

MINING AND SCIENTIFIC PRESS.

SAN FRANCISCO:
Saturday Morning, Sept. 27, 1884.

TABLE OF CONTENTS.

EDITORIALS.—The Big Alaska Quartz Mill; New Form of Building Construction, 193. Passing Events; Dividend Paying Mines; Anaconda, Montana; Arizona Copper; Joint-Protector and Igniter for Fuses, 196. Mechanics' Institute Medals, 197.

ILLUSTRATIONS.—Sectional View of 120-Stamp Gold Mill for Alaska, Built by the Risdon Iron Works, 193. Plan of the Alaska 120-Stamp Mill, 197. New Pioneer Hall, on corner of Fourth Street and Lick Arcade, 198.

MECHANICAL PROGRESS.—The Detached Steam Boiler Furnace Fallacy; Iron Cars; A New Barrel Machine; A Remarkable Locomotive; The Mills of Old and of the Present, 195.

SCIENTIFIC PROGRESS.—Oxidizing Influence of Light; Solar Explosions; Electrical Notes; A New System of Telegraphy; The Vapors of Water and Naphtha; A New Microtome; Gas from Sawdust, 195.

USEFUL INFORMATION.—Adulteration in Leather; Celluloid; Paper Doors; Blue Glass Again; A New System of Embalming; Small Inventions; Hay Water; The Coming Press, 199.

GOOD HEALTH.—Boils; Length of Our Lives Increasing; Pains from an Amputated Leg; To Remove Freckles; The Source of Bile Acids; Killed by Gazing at the Sun; Death from Peanuts; Mortality among Children, 199.

MISCELLANEOUS.—Support Your Own Mechanics and Manufactories; Mining Outlook in Utah; The Little Rockies; Notices of Recent Patents, 194. Oppressed Miners; Tribute System at the Empire Mine; A Promising Mining Region; The New Pioneer Hall, 198. Gold Mining, 199.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 200-1.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 204.

Business Announcements.

Stockholders' Meeting—Fremont M. & M. Co., S. F.

☞ *See Advertising Columns.*

Passing Events.

There is very little news of special interest from the mining regions. The excitement concerning the Little Rocky mines, in Montana, is mainly local. There are so many miners in Montana and Idaho that they can soon cover a field without any accessions from California, Nevada or Arizonia, and being close by, have the best chance.

While local business affairs are somewhat dull some little impetus has been given to trade here, by reason of the Franco-Chinese war. Large shipments of provisions, canned goods, etc., are being made from this port to China. Among other things, the Chinese have bought in this city and shipped within the past month, upwards of 8,000,000 pounds of flour.

Prospecting in the mountains is nearly done for this season as in a short time the river will drive the wondering prospectors into winter quarters.

Mechanics' Fair Premiums.

The committee's report on class 2, hydraulic machinery and steam pumps, has not yet been received by the managers.

The Secretary, J. H. Culver, 31 Post street, desires that he be notified at once of any errors or omissions in names of persons or articles in this list, so that the premiums which are now ready may be suitably inscribed and delivered without delay.

THE Kentuck mine, in Patterson District, has struck a rich body of ore on the 500 level.

Dividend Paying Mines.

When people reap in the papers the figures in tables purporting to give the mining dividends for the month or the year, they naturally suppose that they represent all the mining dividends of the country. But this is a mistake. These tabulated statements only show the dividends from large incorporated companies, most of which advertise their notice of dividends. The newspapers have no means of finding out the profits of mines generally, any more than they have of finding out the profits of any manufacturing or mercantile enterprises of a private nature. As a general proposition, it may be said that mining people are reticent on such subjects, and conduct their operations much as private individuals conduct any other business.

When big companies, with numerous stockholders declare dividends, the fact becomes generally known in the camp where the mine is situated, and in the town where it has its offices and principal place of business. Dividends have an effect on the price of stock, and many big companies care more for this than they do about the dividend itself, as the officers and shareholders are, to say the least, apt to be as interested in the price of shares as in the mine itself.

Of the profits of thousands of small mines all over the country, or of large ones owned by individuals and not companies, the press and public know nothing whatever. The owners are not apt to be communicative on the subject. They are working these mines for the bullion they yield, and not for stock-jobbing purposes. Therefore, they consider that the public have no concern with their profits or losses.

Last year, for instance, the bullion product of the States and Territories west of the Missouri river aggregated $84,639,212. No estimate ever can be given as to how much of this sum was paid out in dividends. It was known how much the big mines paid but the amount was comparatively very small. It stands to reason, however, that among the thousands of mines being worked, whose product is embraced in the aggregate given, there must have been very many which were paying profits. But there is no means of knowing how many. There were very few of the incorporated companies in California which announced dividends last year, yet the State produced between sixteen and eighteen millions of dollars. Numbers of quartz, drift and hydraulic mines were paying their owners largely, yet the figures never found their way into the tables of dividends which were published.

In fact it is these small mines, worked by partnership, individual or private companies which make up the life of the mining region. For one big, well-known company, there are a hundred small ones. Their owners settle up the country and build up the mining camps, and increase the bullion product, but they make no noise about it, and do not care for any advertising of their mines. When a mine has been worked in this way for a long time, and is then made a stock company of, with a list of officers, shares for sale, etc., it is a pretty good indication to those best posted that the "meat" is out of the mine. Then there are mines worked in a private manner by such men as Hayward, Haggin & Tevis, Hearst and others which yield handsome fortunes every year, but nobody but the owners knows how much. It is just as well to bear these facts in mind when reading in the Eastern papers the lists of dividend paying mines. They do not represent the one hundredth part of the mines that are paying profits to their owners.

Tribute Mining.

Until within a few years the tribute system of working mines was scarcely known on this coast, and was practiced in very few places. Now a large number of mines are worked by tributers, and the system seems to be growing in favor. It is principally due to the presence of so many Cornish miners that this system, so long in vogue in Great Britain, has come to be grafted into our mining customs in this country. It is perhaps more widely carried on in Colorado than elsewhere on this continent, although in other States and Territories there are many tributers at work in the different camps. In another column is a short account of the wages earned at this sort of work in Nevada county, California.

Men work better when working for themselves than when paid by the day. In working other people's mines by tribute there is more encouragement than when digging away for day wages. There is a chance for the miners to make a good raise when they have a percentage of the profits, and they know that no matter how hard they work when day's wages are paid they will get no more. The tribute system is a good thing for the mining community in more ways than one.

Arizona Copper.

The copper mining industry in Arizona is rapidly increasing in importance. But, profitable on the whole as it has been, it has in a number of instances been disastrous. Poor management, lack of metallurgical skill, too much waste in providing reduction works before the mines were fully developed, and absence of proper amount of capital, have led to failure. Again, mines near railroads, where they could get fuel, can do better than those at a distance from it. But because a miner has a copper claim it does not always follow that he can make money out of it. Those well operated, however, and with good smelting plants, have mainly done well.

The ores of Arizona are almost exclusively carbonates and oxides, not carrying enough silver to make its extraction profitable, though in some instances ores richer in silver have been found. As yet in most of the mines they have not gone deep enough to open notable deposits of sulphurets, and until that point is reached no falling off in production need be looked for in the more favorably located mines. Some of the ores are very easily smelted and furnish excellent copper. It is not the rule, however, that oxidized ores must produce a pure metal. The general practice in Arizona is to smelt these ores in water-jacket furnaces, with coke as a fuel wherever available. The ores are usually basic in character, and require silicious fluxes. The tendency in the smelting business in Arizona appears to be in the direction of fast driving by using high pressure of blast and chambers for gathering flue dust, thus running up the capacity of the furnaces and diminishing general expenses and the labor account. The three principal centers of copper production in the Territory are in the Clifton District, in which the Arizona and Detroit companies work, Bisbee, where the Copper Queen has made such a success, and Globe, where the Old Dominion is the leading producer.

Joint-Protector and Igniter for Fuses.

Among patents recently issued by the Government, of interest to the mining community, is one to Eldridge A. Thompson, of Silver City, Idaho, obtained through the MINING AND SCIENTIFIC PRESS Patent Agency, for a protector for the joint of a fuse, in blasting. It may be used whether the joint be made by the union of two pieces of fuse or the union of the fuse with the caps; the protector being also applicable as an igniter of the fuse.

The protector and igniter consists of a piece of cloth prepared in a peculiar manner, with certain proportions of resin, mutton tallow and beeswax melted together. Into the melted mixture the cloth is dipped until it takes up sufficient to fill its pores and cover its surface with a thin layer of the material.

When the cloth dries it is yet forcible enough to be handled in winding and tying and is both water-proof and inflammable. It is of importance to render the joint between the cap and fuse water-proof. When the hole is tamped with water it is necessary to effect this result to prevent "missing the hole." In any case where dampness surrounds the fuse it is essential to protect the joint. By wrapping this prepared cloth around it, this is accomplished. By reason of its inflammable nature it can be used for igniting the fuse, a use to which it is adapted with better and cheaper results than the ordinary candle stuff. For an igniter a small piece of the prepared cloth is tied around the fuse near the end farthest from the cap. Miners often use soap, tar, grease or clay to protect the joint, but this is quite an improvement.

THERE is upward of 300 men working in and about the mines and mills of Tuscarora.

Anaconda, Montana.

This town takes its name from the Anaconda Mining Co., of Butte City. It is the seat of the concentrating and smelting works of that company. It is distant about twenty-seven miles from the mine, and ore must be brought here by cars on the line of the Utah & Northern Railroad, just over the branch line to Silver Bow Junction, then on the main line to Stewart, and then on another branch to this place. The natural query arises, why have the smelting works so far from the mine? There may be other considerations than are apparent to any visitor to Anaconda, but the following reasons are easily discerned: First, by selecting the present site the company were able to buy a large extent of land for their works, and for the town which is tributary to them, including a magnificent water right or power on the Warm Springs creek. This stream will furnish ample power for running whatever machinery the company may need, and it is a creek more free from ice in the winter season than any other in this section of the country. Already three turbine water-wheels are in place in the works, which will supply power equal to that of a 450 horse-power engine, and if more power is needed it can easily be obtained. The water is taken from the creek about a mile and a half above the wheels, and a fall of 70 feet is obtained. The lay of the ground is such at the works that concentrators, smelters and matte houses may be on separate terraces of the hillside, and by this arrangement the largest economy of labor is obtained, much of the work of handling the crushed ore being made automatic by the use of water. Cord wood for use in the furnaces is much cheaper here than at Butte. The saving in this item, added to the advantage of water power, will probably be as great as the cost of transporting the ore from the mine, so that the company has all its other advantages as clear gain. The town was founded, or laid out, one year ago last June. Since that time it has been a hive of industry. The company have kept from 400 to 500 men steadily employed, paying out in wages some $40,000 to $50,000 per month. Scores of small residences and stores have been erected, some of them of brick, and to-day the population of the place must be fully 1,000. There is a bank, managed by gentlemen more or less interested in the Anaconda Company, and all other institutions needed by any thriving burg of similar population. Hotels, boarding-houses and saloons are most numerous. The town is regularly laid out upon the level creek bottom, and presents one of the prettiest town sites we have seen anywhere. Lots sell for $100 upwards. The upper Deer Lodge valley, of which the Warm Springs canyon is a branch, is a good agricultural section. There are said to be good mining prospects in the mountains adjacent, so that the village has prospects of stimulants to its growth from various directions.

As to the mammoth works of the Anaconda Company here, it is too early to give a description of them. They will be in operation in a month or so, when it would be more opportune to speak of them in detail. But some idea of their extent may be inferred from the fact that the main furnace room is 498x150 feet in dimensions, and the concentrating building 220x200 feet. The matte building will be equally commodious for its requirements, and there are besides a machine shop, blacksmith shop, office, boarding-houses and other buildings. Another large furnace building is now being erected. Four hundred and fifty to five hundred men will be regularly employed at a probable average salary of $100 per month each. The main driving belt in the concentrating room will be a series of huge ropes, which will conduct the power from a wing of the main building to its very summit, over 200 feet. The masonry and frame work throughout are massive and solid, apparently equal to any possible emergencies. The probable aggregate cost of this magnificent plant—the largest of the kind in the world, we think—will be at least $1,000,000.

ASSISTANT UNITED STATES TREASURER SPAULDING'S reports a steady demand for dollars from the interior. The coin is sent free to all parts of the State, the expense of transmission being defrayed out of the silver profit fund arising from the difference between the coin value and the bullion of metal used in the manufacture.

Mechanics' Institute Medals.

Full list of Official Awards for Exhibits at Mechanics' Fair.

Gold Medals.

CLASS 1—Ohmen & Simmons automatic cut-off steam engine. CLASS 3—San Francisco Tool Company, best general display of iron working tools and machinery. 4—Pacific Saw Manufacturing Co., display of saws. 5—The Royal Mustard Mills, display of mustard machinery in operation. 11—Hawley Bros. Hardware Co., best general display of agricultural machinery. 12—California Iron and Steel Co., display of pig iron, charcoal, blooms, bar iron and steel. Judson Manufacturing Co., cast hardware files, nails and tacks. California Wire Works, display of wire rope. 15—Hall's Safe and Lock Co., best display of fire and burglar proof safes. 16—Will and Fink, display of cutlery. 17 San Francisco and Pacific Glass Works, display of California-made glass ware. 18—Emile Boesch, headlights, and car reflector lamps. Weed and Kingwell, best assortment of brass works. 19—John Mallon, display of glass for architectural work. S. & G. Gump, display of mirror and picture frames, mantels, engraving, bric-a-brac, etc. 20—T. M. Antisell & Co., display of California-made pianos and organs. Joseph Mayer, pipe organ, California make. 21—A. Folsom, best general display of carriages, California make. David Kerr, best two or four-horse truck. Charles W. Stein, best display of carriage material. 22—Indianapolis Chair Manufacturing Co., best general display of furniture. 25—Main & Winchester, general display of harness and saddlery. H. Liebes & Co., display of furs and their manufacture. 27—Carlson & Currier, California manufactured silk thread and silk. Pioneer Woolen Mills, display of home-manufactured woolen goods. 34—Arpad Haraszthy & Co., best general display of wines and brandies. 38—John Roach, best surveying instruments. California Electric Light Co., display of electric light. Thompson & Houston Electric Light and Power Co., display of electric light. 42—B. Natban & Co., general display of art work. 46—John H. Sievers, for excellence and fine display of flowers.

Silver Medals.

CLASS 1.—Joshua Hendy Machine Works, engine with slide-valve, vertical engine and boiler combined. George Bull & Co., portable engine on wheels. Hawley Brothers' Hardware Co., straw-burning engine. Thompson & Evans, upright yacht engine. H. P. Gregory & Co., gas engine. Risdon Iron & Locomotive Works, steam boiler, "Heine's patent." 4—P. McG. Chisholm, portable saw-mill. H. P. Gregory & Co., best general display of imported wood-working machinery, best surfacer and matching machine, best shingle machine.

CLASS 3—San Francisco Tool Company, best engine lathe; best power drilling machine. California Bellows Company, best hand bellows; best tuyere iron. W. T. Garratt, best fan blower, "Anderton patent." George Cumming & Co., best portable forge.

CLASS 5—W. A. Bell, display of models and machinery. S. F. Chronicle, best display of stereotype plates and matrices. Examiner Publishing Co., display of stereotype plates, matrices and paper. Gillet Ice Machine Co., portable ice machine. J. M. Thoms, Lamson cash railway. H. H. Bodwell, Excelsior Self-Regulating Windmill. Henry M. Taafe, automatic safety guard for railway cars.

CLASS 6—L. Rsdowitch, rock-breaker. E. A. Rix & Co., rock drill, air compressor. F. A. Hill, quartz mill. Goss & Dow, vertical mining pump. E. C. Denniston, amalgamating mining plates.

CLASS 8—E. Nunan, screw hose coupling.

CLASS 10—John H. Mooney, bag sewing machine, "Mooney's Patent." Cal. Silk Culture Development Co., silk reeling machine (in operation). Sam'l Hill Estate, best family sewing machine. Same, best exhibit of man'fg sewing machine. Same, best button-hole machine.

CLASS 11—Baker & Hamilton, display of agricultural implements. Hawley Bros. Hardware Co., reaper and mower with self-rake, thrasher and separator. H. W. Rice, potato digger, portable hay press. F. A. Hill, gang-plow (Cal. make). G. G. Wickson & Co., centrifugal cream separator. Ira Bishop, sack elevator. Baker & Hamilton, barley crusher. Henry Tyack, wine press.

CLASS 12—California Wire Works, wire goods. Burton & Hoyt, bolts, nuts and screws.

CLASS 13—Taylor Goodrich, best display of stoves and ranges. C. D. Harvey, hot water heating apparatus. United Gas Improvement Co., display of gas cooking and heating apparatus. Albrecht & Waters, cooking stove (Cal. make). J. D. Bodwell, (Perfection) liquid fuel.

CLASS 14 Osborne & Alexander, display of hardware and mechanics' tools. J. S. Bean, artificial flies. Liddle & Kaeding, display of fire-arms (Cal. make). E. T. Allen, very fine display fire-arms and fishing tackle.

CLASS 15—W. Wilshire & Co., best fire-proof safe, burglar proof safe. Hall's Safe and Lock Co., best burglar-proof lock. Perriam & Smith, best locks, California make.

CLASS 16—Will & Fink, best carving set. Pacific Saw Manufacturing Co., best planer and currier knives. Frank A. Davis, cutting dies.

CLASS 17—California Stone Paving Co., artificial stone pavement. W. W. Montague, display of mantles, marbleized iron mantles. Taylor Goodrich, art castings. S. P. Kimball & Co., California pozzulani cement. Granolithic Paving Co., artificial stone steps and paving. San Francisco and Pacific Glass Works, druggists' glassware. J. Browell, patent chimney flues, tops and lining.

CLASS 18—Weed & Kingwell, best display of bells, brass and composition castings. Grimm & Nolan, gas fixtures, California make. A. S. Graff & Co., coal oil lamp and diamond burners. J. T. Titus, best sewer trap. Fay & Co., treatment of redwood in imitation of other wood. S. & G. Gump, onyx pedestals. John Mallon, cut and embossed glass.

CLASS 20—Mr. O. H. Goodwin, key (musical) indicator. Kohler & Chase, best display of musical implements (imported), best brass wind instruments. Charles Morrell, banjos (Cal. make). Zeno Mauvais, best display of pianos and organs (imported).

CLASS 21—A. Folsom & Son, best coupe, best open rockaway. M. J. McCue, best hack, best top rockaway, best top buggy. W. E. Shaw, village cart, open buggy. Studebaker Bros. Manufacturing Co., best display imported carriages. Carville Manufacturing Co., best buggy-top phaeton. E. Soule, best dump-cart. J. A. Bilz, display of two-wheeled carts. Hawley Bros., best farm wagon (imported). Baker & Hamilton, best 4-seat spring wagon (Cal. make). David Kerr, ambulance for dumb animals.

CLASS 25—P. T. McNulty, best display of boots and shoes, Cal. manufacture. Main & Winchester, best set of carriage harness.

CLASS 26—California Jute Mill Co., display of jute and jute manufacture. The Examiner Publishing Co., display of printing paper.

CLASS 27—Pioneer Woolen Factory, display of all-wool cassimeres. California Silk Culture Development Co., specimens of California manufactured silks. J. Spaulding & Co., best process and compound for cleaning and renovating carpets.

CLASS 28—Joe Poeheim, best gents' dress and business suits. Wm. Sonderup, display of skin clothing. Chas. Sutter, Jr., oiled clothing.

CLASS 29—A. J. Balny, display of ostrich plumes, plain and colored. Miss Minnie James, best ladies' dress suits "style and finish." M. H. Ober & Co., corsets. Mrs. K. M. Stewart, bounets and bats.

CLASS 30—Quigley & Son, granulated smoking tobacco. The Friend Erskin Cigar Co., best cigars, California manufacture.

CLASS 31—Henry Lake, shoe blacking. Russian Cement Co., display of liquid glue. Western Perfumery Co., best display of perfumery, California manufacture, best flavoring extracts. Bothin Manufacturing Co., baking powder.

CLASS 32—Thomas Morton, display of coals. California Silk Culture Development Company, collection of cocoons and raw silk. Woodward's Gardens, collection of stuffed birds and mammal skins.

CLASS 33.—Wheeler Packing Co., display of fruits and vegetables in glass. Mrs. Sol. Runyon, jams, jellies and preserves (home made). George Haas, display of confectionery.

CLASS 34.—Arpad Haraszthy & Co., Eclipse champagne (Cal. make). G. M. Jarvis, excellent display of wines and brandies.

CLASS 35.—Burnell & Turner, Albion ale and porter.

CLASS 38—Sperry Electric Light Co., display of arc and incandescent electric light. California Electrical Works, best display of telegraphic and electrical apparatus. Electrical Supply Co., Brook's Faradic current distributor. Baxter Overland Telephone Co., best telephone and transmitter. John Roach, illuminated plumb bob. W. B. Wilshire & Co., best display of scales. Davis & Look, best incubator and breeder. United Gas Improvement Co., Siemens' patent regenerative gas lamp.

CLASS 39—Mrs. C. W. Stevens, adjustable shoulder brace and suspender. Wm. Beeman, artificial limbs.

CLASS 40—Thomas Hatch, display of California and Pacific woods. Miss Maggie Butte, point lace. Mrs. P. J. Kramer, display of embroidery.

CLASS 42—Mrs. Theresa Corlett, best display of Barbotine and Florentine pottery. Mrs. Helen Brode, best collection of ceramic art. T. R. Southern, display of penmanship and lettering.

CLASS 45.—Pacific Coast Amateur Photo. Association, display of instantaneous photographs. N. M. Klain, photographic landscapes, including buildings. New York Photograph Gallery, display of photographs. Mrs. C. E. Danielwitz, display of crayon portraits.

CLASS 47.—Sol. Runyon, best general display of fruit. Mrs. Charles B. Brigham, best floral design by an amateur, "pagoda and summer house." Misses Rose and Geraldine Coursen, best floral bouquet by amateurs.

Bronze Medals.

CLASS 1—H. W. Rice, steam engine governor. Garcelon & Moore, rotary steam engine. W. T. Garratt, boiler feed injector.

CLASS 3—C. F. Marwedel, best display of machinists' tools. San Francisco Tool Company, best shaper for metal work.

CLASS 4—H. P. Gregory & Co., band sawing machine, ripping and cross-cutting saw.

CLASS 5—H. W. Rice, lifting jack. F. O. Landgrave, change gate for street cars. Hawley Bros. Hardware Co., Perkin's patent wine mill. P. P. Mast & Co., Turbine wine mill. E. W. Tifft, decorative designs for business houses.

CLASS 6 Joshua Hendy & Co., ore feeder, hydraulic nozzle.

CLASS 7 E. W. Melvin, (New Becker) washing machine.

CLASS 9—G. T. Peters, model ship Excelsior.

CLASS 10—Dukerman & Austin, shoemakers' needle.

CLASS 11—Hawley Bros. Hardware Co., corn sheller. Baker & Hamilton, power churn, harrow (California manufacture), improved header. P. P. Mast & Co., riding cultivator, sulky hay rake. G. G. Wickson & Co., hay and straw cutter.

CLASS 12—C. Nutting & Son, iron wheel-barrow. E. A. Rix & Co., ornamental ironwork, feucings and castings. Cal. Iron and Steel Co., malleable iron castings. Clot & Meese, wrought iron rim pulleys. Lock Spring and Mattress Co., best mattress spring.

CLASS 13—Chas. Brown & Son, display of house-furnishing goods. J. F. Myers, (Monarch) oil and gas stoves. C. A. Cushing, gas stove and water heaters.

CLASS 14—Liddle & Kaeding, display of fishing tackle.

CLASS 17—W. W. Montague, fire-grates. San Francisco and Pacific Glass Works, self-sealing fruit jars.

CLASS 18—Weed & Kingwell, steam, water and gas fittings. Fred. Jantzen, coal-oil lamps.

CLASS 19—H. J. Esdor, display of sample goods of general manufacture. Boiler Furniture Manufacturing Co., square and octagon balusters. C. F. Schiller, plaster center-pieces and work. A. I. Sanborn, Newell posts.

CLASS 20 Robert Fay, general display of Cal. made pianos. G. F. Wells, orchestrones.

CLASS 21—Osborne & Alexander, best tricycle, best bicycle. R. Kelley, best huckboard.

CLASS 22—G. W. Clark & Co., display of wall paper, window shades and fixtures. H. H. Gross, folding bed. E. H. Marwedel, brass bedsteads, curtain poles and stair rods. T. S. Clark & Son, metal spring bed bottom. Keystone Wringer Co., spring beds. Fay & Co., wardrobe beds. John Callahan, drop roller for window shades. B. F. Farrar, spring mattresses. Truman S. Clark & Son, dressed goat skins.

CLASS 23—P. Liesenfeld, best billiard table cushions.

CLASS 24—Magazine Manufacturing Co., patent stove brush.

CLASS 25—P. F. McNulty, men's boots, hand made. Main & Winchester, best saddle, display of whips. P. F. McNulty, ladies' and misses' hand-made shoes. W. T. Y. Schenck, cotton hose.

CLASS 26—H. Liebes & Co., display of carriage robes.

CLASS 27—Pioneer Woolen Mills, display of flannels.

CLASS 28—J. H. Kruger, canes.

CLASS 29—Kelly Bros., corsets. Mrs. P. F. Butler, display of millinery. Kraker & Israel, display of machine-made embroidery. Davis Sewing Machine, best work done in fair.

CLASS 31—G. G. Wickson & Co., Imperial egg food. Continental Oil and Transportation Co., lubricating oils.

CLASS 32—C. Richard Knapp, vacuum press percolator.

CLASS 33—P. Wulff, mustard, sauce and pickles.

CLASS 36—W. S. Moore, display of amateur books and newspapers.

CLASS 38—Cal. Electrical Works, best telegraph printing apparatus. Cal. Electrical Works, best automatic fire-alarm apparatus, best hotel annunciator or burglar alarm. Electrical Supply Co., best telegraph set, key and sounder.

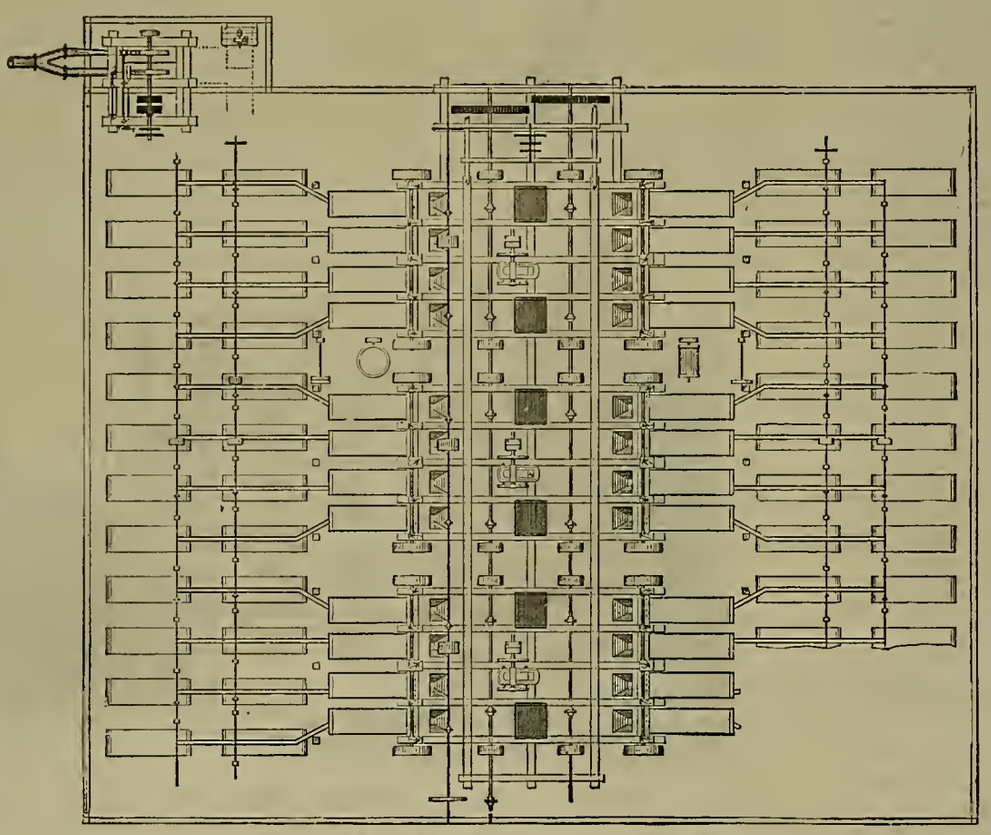
CLASS 39—B. Galland, folding cabinet bath.

CLASS 40—Mrs. A. Baker, wax flowers. Mrs. J. E. Cotter, preserved flowers. Miss A. M. Favor, needle work. C. Flammer, ornamental tables (shell). J. M. Litchfield, gold and silver embroidery. Chas. Peake & Co., Turkish rugs. Miss A. R. Vrooman, silk tapestry. Baumgartner & Bohls, Gold Bar cigarettes, California make.

CLASS 42—Mrs. F. A. Fish, best single specimen of painting on pottery. Mrs. Sarah H. Weston, gold enameled porcelain. Miss Carter, band-painted fire screen. Mrs. F. A. Fish, best collection of decorative art other than ceramic. Mrs. C. H. Morgan, painted panel screen in oil. Miss Eva McCormick, collection of luster paintings. Mrs. E. C. Hatch, water-color painting on satin. Mrs. Helen Brodt, best single specimen painting on porcelain.

CLASS 43—Miss Eve Josephi, Barbotine vases. E. L. Gifford, repousse work. Fred.

(*Concluded on page 204.*)



PLAN OF THE ALASKA 120-STAMP MILL. (See page 193.)

Oppressed Miners.

An associated press dispatch, dated Cleveland, Sept. 19th, says: The condition of the evicted miners and their families in the Hocking valley district is something to excite the commiseration of the benevolent. A mass meeting will he held in Columbus next week, at which W. P. Rend, a coal operator who has not redneed the price of mining, will preside, lor the purpose of eliciting both public opinion and public sympathy. In the mean time legal machinery is in operation down the valley, and evictions are heing constantly made. Every mau who refuses to abjure the union, to work for 50 ceuts a ton, to enter into au ironclad agreement to treat individually with the operators, to stipulate that he will never ask for an increase of wages in concert with another miner or miners, is turned out of his house, if he happens to he on the company's gronud, which is usually the case. His place is then giveu to a man who will work for 50 cents a ton under the contract of abridged personal rights.

As tbe terms proposed hy the operators are little better than absolute slavery, thousands of miners refuse to accept them. Want and destitution are becoming prevalent even before the winter begins. It is hard to conjecture what the couditiou will he three months hence. The tents sent by Governor Hoadly will uot shelter one-half the homeless people, and many of them are compelled to live in the woods like wild auimals. There are from 2,500 to 3,000 of these men in the mining district.

Almost the entire eommercial husiness of the mining district is carried on through company stores, which are stocked with everything sold in large towns. The miners are compelled to buy in these stores. They are given checks, which they present when they make a purchase, and these are charged up to them aud subtracted from their wages at the end of each month. The checks equal the wages of a man with family, and generally exceed hy 50 per cent the monthly earnings of a single man. "I could not stand it to clerk in these stores," said a gentleman who was formerly engaged in one as a clerk, "it was robbery of the most unprincipled sort. Every imposition was practiced on miners. The cash buyer could get a full plug of tobacco for 50 cents, and a miner with a check was required to pay $1. Coffee was sold to the cash buyer at 16 cents a pound, and to miners at 26 cents. Prints that went to the cash buyer at 6 ceuts a yard, cost the miner's wife and daughter double that amount. The miners were invariably charged from 35 to 50 per cent more for everything than were people who paid cash, and more than 80 per cent of the aggregate earnings of the miners was paid over the counters of the stores in goods and groceries at an average of almost two prices. When operators were giviug 70 cents a ton and paying for most of it in goods, the price of mining was redneed nearly one-half. I believe that the miners would work at 60 or 55 cents a ton if there were no compauy stores, so that they would be paid in cash and left to purchase at independent stores, where husiness competitiou wonld keep prices down."

Tribute System at the Empire Mine.

A correspondent of the *Bulletin*, writing from Grass Valley, Nevada county, says:

The second great mine of this district is that known as the Empire or Ophir Hill. It is located as the same side of the town as the Idabo, and is also about a mile and a half from the heart of the town. The Empire, perhaps, has heen worked for a longer period than the Idaho, hut its dividends have been irregular, and the mine has frequently heen shut down in the course of its history. It has also met with disaster in the burniug of several mills, one of which cost over $100,000, and was on a scale of elegance never excelled in a quartz mill. The present mill is a small, well-built structure, with the exterior appearance of a C. P. R. R. waiting-room. Inside it is a model of neatness and handy arrangemeut, and is amply supplied with the best machinery of modern make for saving the gold. As to the monthly product of the mine, the uumber of men employed, the assay value of the ore hoisted and crushed, the ratio of profit per tou, and similar interesting particulars, the visitor has no means of findiug out. This is a close corporation in every sense of the word. The men working for the company must keep tbeir mouths shut as to operations in the mine, or call at the office for notice of settlement aud discharge. Even the poor miners who cull the dumps for a percentage are not allowed to give au idea of their monthly return. What the public knows it gleans from stray bits of iuformation dropped here and there, which in some manner reveal the general uature of the property. From this sonrce it is premised that the Empire is just now in a most flourishing condition, aud outward indicatious would seem to point to the truth of this view, for the miuc employs a large number of men, pays them promptly, has money to put into new enterprises, while the managcment have the air of meu who know they have a good thing and intend to keep it.

Tbe Ophir is very largely worked by tbe tribute system; that is to say, a miner or group of miners takes a contract to get out a certain amount of rock for a percentage of the profit in it, or for so much per ton. In the Empire mine the following rate of tribute is the rule: On rock that pays $10 per ton, the miner gets 90 per cent of the profit; on $15 per ton, 85 per cent; on $25 per ton np to $40 per ton, 75 per cent and on any rock above $40 per ton, 60 per cent. To the novice these figures might seem to indicate that the tributer of the Empire is a fortunate individual. Such, however, does not seem to be the fact, as many a miner will tell you that tbe day worker counts his dollars in greater number at the end of the month than the man who works for a percentage. Nevertheless the charm of speculation is such tbat the Empire never wants for an ahundance of tributers.

The Empire is worked by steam only, and on every side of the buildings are huge piles of wood, hundreds of feet in length hy an average of fifty feet in width and fifteen or twenty feet in hight. This wood consists mostly of the common scrub pine of the surrounding mountains cut into four-foot lengths, some of it split, but much of it in a natural state. This wood is furnished the mine by adjacent farmers and woodmen, who are paid an average rate of $4.25 per cord delivered and piled at the mine. During the course of the year the Empire nses immense quantities of this wood, and it is safe to assert that it is one of the most expensive items iu the list of its expenditures.

AN IMMENSE DAM.—The Montana Improvement Company is now putting in on the Big Blackfoot, near its mouth the largest dam ever constructed in Montana. The river at that point is about 350 feet wide. The dam is heing constructed on a riffle, where the water does not now exceed three feet in depth, but it is eight or ten feet deep above and below that point. Au experienced builder from the East has charge of the work and has seventeen men employed. All the timber is on the ground, and the foreman says if he can get it in before the slush ice runs, as he expects to, he has no fears of its going out. The bottom stringers, immense timbers laid up and down the stream, are 100 feet long. The breast of the dam is ten feet high. Its estimated cost is approximately $20,000. The object of the dam is to make a pool a half mile or more long iu which to boom logs without making a slack-water. The entire enterprise will cost $150,000.

USE HAND-JIGS.—Claim-owners who have jiggiug ore, hut who cannot afford steam or water power jigs, should go up to the Idaho Democrat mine, up Croy gulch, and see the hand-jig in operation there. It makes from one to one and a half tons of first-class ore per day, at a cost uot exceeding $5. A hand-jig, it will be remembered, was first used hy the Jay Gould company as an experiment, and the result was so satisfactory that a dozen companies at once put in jigs.

LARGE consumers of ingot copper havej usj completed a pool for the purchase of about 5,000,000 pounds Lake Superior product, deliveries to run the balance of the year at the price of 13 cents per pound.

A Promising Mining Region.

The following from the Wood River *Times* gives some detail concerning Blackburn district Idaho: John Kendall, says that the region hetween Wood and Little Lost rivers—a stretch of country 120 miles long from east to west, and from the Blackfoot road on the south 300 or 400 miles to the British Possessions on the north—is practically unprospected and untrod by civilized man. Yet it is one of the most promising mining regions on the face of the globe.

Wherever a man goes he sees evidences of rich mineral, and any fair prospector may go there with a certainty of striking a good prospect.

Blackburn district—Mr. Kendall's home—lies iu this region. This district commences opposite D. B. Hawley's house, on Little Lost river, where a huge standstone reef 100 feet wide and 80 miles long crops out in a northernly and southernly direction. Over-lying this sandstone on the east is a ledge or stratum of black lime about the same thickness as the sandstone. Iu the contact between the two, at irregular intervals not more than a quarter of a mile apart, argentiferous galeua ores are found.

First, above Mr. Hawley's about six miles, is the Lizzie, an 18-inch vein of galena. The Silver Queen adjoins the Lizzie, and shows equally well. Half a mile above, on the Ingersoll, there is a vein of solid galena about two feet in width. A car-load of this ore recently sold in Salt Lake netted 118 ounces per tou. The Dixie comes next, but shows no galena.

The Combination is the next claim. The shaft is down 100 feet, and shows a good vein of carbonate of iron and galena, hut the width of the vein is unknown. The Carbonate Queen on the same vein, bas the same appearance. It has a shaft dowu 72 feet, all in ore.

The Tyndall lode was the first discovery. The ore of this mine is the freest galena ever seen. It goes 172 ounces per ton, from the grass roots, with 60 per cent lead. The adjoining claim shows no ore. Theu comes the Daisy Black, owned by three capitalists of Cincinnati, which shows a 9-foot vein of solid galena at a depth of 50 feet, the lowest of which goes 46 ounces, and the highest 1,776 ounces per ton. This from 13 assays, "promiscuous" samples. There are 1,500 tons of ore on the dump, and twice as much in sight. Four hundred feet north of the shaft is a 70-foot tunnel cutting across vein, which shows five feet of the same grade of ore.

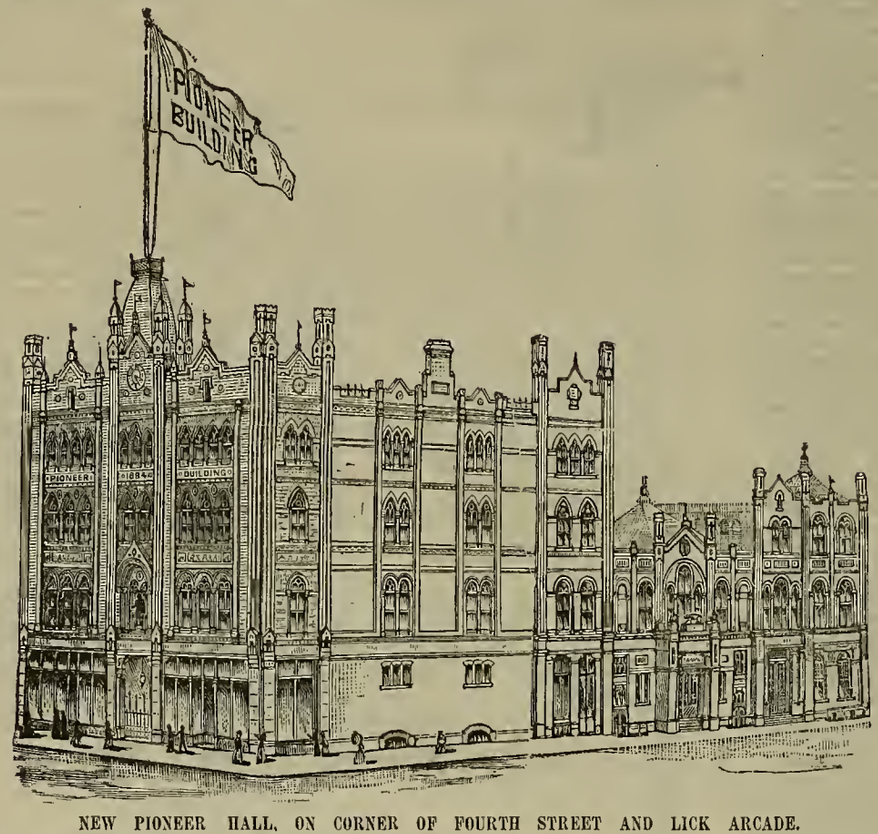
The Great Northern adjoins. It is also a magnificient claim, showiug a huge vein of sand carbonate ore, which is very rich. This belongs to the Daisy Black crowd.

Next comes the Alice, owned by Mr. Kendall. This has two tunnels and two shafts. One tunnel is in 128 feet, the other 60 feet. The long tunnel shows an average of 3½ feet of galena all the way. The ore assays from 200 ounces to 383 onnces. This was the showing of 12 assays. The 60-foot tunnel shows a width of *thirty-one feet* of solid carbonate ore, and the ore vein is not yet cut through. Mr. Keudall, the owner, prefers not to say how rich the ore is. There are five other promising claims in this camp, but there is not much work done on tbem.

The New Pioneer Hall.

Scattered throughout the mining regions of this State are hundreds of California pioneers who will he glad to learn that the Society of California Pioneers, which has its headquarters in San Francisco, is now erecting a handsome edifice. Through the munificence of James Lick the society has a valuable lot on Fourth street, near Market, upon which the building is beiug put up. For years they have occupied an old building on Montgomery street, but in a few months the society will have headquarters they will be proud of. The accompanyiug engraving, for the use of which we are indebted to the *Chronicle*, shows the appearance of the structure. The coruer stone was laid with appropriate ceremonies on the anniversary of the admission of California into the Union.

The new hall will be one of the handsomest and most substantial buildings in the city, and will cost $150,000 exclusive of furnishing. It will be located on the west side of Fourth street, and will have a frontage of 80 feet on Fourth by 195 on Lick arcade, with a depth of 275 feet. The architecture will he Venetian-Gothic with some modifications. The building will he four stories high, surmounted by a tower 102 feet high. The basement will be 14 feet high, 28 wide and 76 deep, and be used as a hanqueting room. The ground floor will he for stores. Above this will he halls large and small, rooms for the officers, library, two museums, billiard rooms, card rooms, a large hall for meeting purposes, 39 feet high, with a floor space of 64x48 feet and a gallery; there will be a barber shop, kitchen, serving room, etc., in the basement. Sandstone, iron, pressed brick and red terra cotta will be used on the outside of the building, which will, in the main be constructed of brick and iron. The Fourth-street front will be quite ornamental.



NEW PIONEER HALL, ON CORNER OF FOURTH STREET AND LICK ARCADE.

In this connection, a few words concerning the old Montgomery street headquarters will be interesting. On the 8th of July, 1862, the coruer-stone of the building now occupied by the Pioneers was laid by the Grand Lodge, F. aud A. M., there being a large civic aud military turnout. The orator of the day was William B. Farwell, who, by a happy coincidence, was orator of the day on the recent occasion. The lot was donated by James Lick, who also gave them the lot they are now building upon. When completed the old building cost over $24,000.

THE new cable for the Market street road has been hauled from Harrison street wharf to the company's engine house. It weighed 33 tons, and a team of 28 horses was required to effect the transfer. The new rope will not be laid for some time yet, the old one still being in good condition.

Gold Mining.

It has been stated that the Homestake is one of the most successful gold mining companies in the world, and the regularity with which dividends are declared and paid on its stock is the best possible assurance of the fact that the Homestake property is a great producer of gold bullion. Crops may or may not fail, times throughout the country may be good or bad, but the Homestake never fails to come to time with its monthly dividend. All this time there is a large force at work driving new tunnels, sinking new shafts and doing other work to facilitate the extraction of ore in the future, and this force as well as the hundreds of men employed in handling the ore now being milled, hundreds employed in cutting and delivering fuel and timber, all the men employed in and about the mills, are paid regularly each month, and still the dividends are regularly declared and paid, and there is a reserve fund constantly kept on hand to meet any emergency calling for extra dead work. As we have stated, the Homestake group is only one of many found in the Hills, and the success which its management has attained by judicious work points to the fact that other large properties further south, may, by being worked on the same principle, handling ores in large quantities and using large mills, be made to pay. The ore of numerous large veins throughout the southern part of Lawrence, through Pennington and well into Custer county is known to contain good metal in quantities to pay, and in many cases the natural facilities for working them are better than were those of the Homestake. One great advantage possessed by the Central Hills is an ample supply of water. This the Homestake did not have, and it was only at great expense that it was secured by ditching and fluming long distances, and combining many of the small streams of the Northern Hills. The great ore bodies of the Central Hills lie contiguous to good streams, such as Elk creek, the three Box Elders, Jim creek, Rapid and Castle creeks, Slate creek, Spring creek, and numerous tributaries—water enough to supply thousands of stamps. That the water will be utilized for this purpose is certain. The rights under which it is held will in the course of a short time become very valuable. —*Black Hill World.*

GOLD MINES OF THE TIBER.—An interesting statement was made at the last session of the Geographical Society. Mr. Del Mar, who has recently returned from Italy, stated that he had examined the ancient gold mines of the Tiber, which had been first worked by the Etruscans and afterwards by the Romans. The working of these mines by slave labor under the Romans led to the rebellion of Spartacus and to the interdiction of all mining by the Roman Senate. The mines were mentioned by Aldrovandus in the sixteenth century and Torricelli in the seventeenth, but since that time have passed out of notice. Their working by the Romans led to the fouling of the River Tiber, the formation of the pontine marshes and the conversion of the island of Cercaii into a promontory; their abandoument to the formation of the Tuscan Maremma, a fever-infested district which has only recently been drained. The lecturer traced the discovery and working of the gold mines of the Tiber, the Roman conquest and reopening of these mines and the numerous physical and social changes to which these events gave rise. From this it appears that the debris question, so new and important to California, had agitated the Roman mind twenty centuries ago and had been brought to a conclusion in one part of Italy by an amicable arrangement between the miners and farmers and in another part by an interdict of the Senate. The mines of the Tiber were placer diggings, some of which were situated near Perugia and others in the Veldi Chiana. At present they are entirely abandoned, the only gold mines at work in Italy being the quartz mines of Piedmont.

THE WEALTH OF HUMBOLDT COUNTY.—According to the Assessor's report to the Surveyor-General, the number of acres of land inclosed in Humboldt county is 42,300, of which 9,218 are cultivated. There are 4,000 acres of wheat, 5,000 of barley, 155 of oats, 2 of corn, 58 of potatoes and 17,700 of hay. There are 5,000 apple trees, 2,500 peach trees and a less number of pear, plum, cherry, nectarine, quince, prune and apricot trees. In the way of live-stock there are 5,600 horses, 200 mules, 10 asses, 32,500 cows and calves, 11,348 beef cattle, 66 work oxen, 57,600 sheep and lambs and 20 Angora goats. There are 3 grist mills and 10 quartz mills. There are 10 miles of mining ditches and 400 miles of irrigating ditches. The estimated population and the number of acres of land under cultivation are the same as in 1883, though there has doubtless been an increase in both within the last year. The assessed value of real estate is $2,100,935 and of personal property $1,042, 754.

THE San Francisco Copper Mining Company, of Spenceville, made an exhibit at the Grass Valley fair of native copper ore, raw copper ore, roasted, copper precipitates, sulphate of copper from leaching and sulphur. The Fox copper mine of Rough and Ready township exhibited specimens of 63 per cent copper ore, yielding $18 in gold and $16 in silver per ton.

USEFUL INFORMATION.

Adulteration in Leather.

An extensive adulteration of leather has just been detected and exposed by the inspectors of the imperial Government in Germany. It is accomplished by adding glucose in large qautities, by soaking the tanned hides in that adulterant, and drying them, which materially increases their weight, apparent solidity of texture and money valuation. The adulteration may be detected by macerating the leather in water for 24 hours or more, when a thick, ropy, viscid solution of glucose is formed. Not only is the weight of leather augmented by the process, but poor and sleazy products of the vat are turned out with the apparent density and elasticity of the finest qualities, and retain this appearance until saturation exposes the fraud.

This process of leather adulteration has also reached this country, and, according to a circular recently issued by the *American Tanner*, the city of Louisville, Ky. appears to be the American headquarters of this fraudulent practice.

When we are told, says that paper, that some samples of leather have been found which had as much as 30 to 40 per cent of extra weight, it seems that something should be done in this matter. There are numerous tests for glucose, but the most of them require a number of more or less expensive apparatus, while the following recommends itself by its simplicity and cheapness, as the complete outfit, consisting of s small test tube and two small bottles, one containing cupric sulphate and the other caustic potash, may be obtained anywhere, and can he carried with ease in a vest pocket.

A little scrap of the suspected leather is soaked in pure water; to this liquid, enough to fill about one-quarter of the test tube, we add a few drops of a solution of cupric sulphate, and half as much of a caustic potash solution as the liquid contained in the test tube; shake well and boil over a flame. If glucose is present, a yellow or red precipitate is formed in the tube.

Cupric sulphate, or blue vitriol, readily dissolves in water, and enough of it must be added to the sample to produce a faint blue coloring. The caustic potash solution is made by dissolving 58 grammes of the potash in 1 liter of water.

The principle upon which the test is based is as follows: The boiling alkali converts the glucose into glucic and melassic acids, substances which oxidize rapidly. The cupric sulphate is then converted into cuprous sulphate, and this again is decomposed, forming a deposit of cuprous oxide. Of course it is only a rough test, because we are told that under normal conditions leather contains a trace of glucose; but if the test has been performed once or twice on good leather, any excess of glucose in other samples can easily be detected by the deeper color of the more copious deposit in the test tube.

Glucose is a fraud, however used. It is even a greater fraud when used on leather than when used in adulterating sirup or sugar.

CELLULOID—ITS DISCOVERY.—A new material in the arts and manufactures made its first appearance in the United States about the year 1869. It was the result of a series of chemical experiments by men who were not chemists, but experimenters, seeking a substitute for ivory. It is more than likely that its final discovery was accidental, like the discovery of the mode of vulcanizing india rubber, and like the discovery of many of the great inventions. It took five years of experiments after its discovery to make it a marketable commodity. In the ten years since that time it has taken rank with the leading compounds of commerce and manufacture, such as india rubber, glass, steel, and paper. In its peculiar and varied utility it is superior to india rubber, and new modes of use are being found for it almost daily. It is as hard as emery, as delicate as tortoise-shell, as flexible as india rubber, as durable as iron, and as elastic as ivory. It resists acids and alkalies, and is unaffected by atmospheric changes. It can be molded, or carved, or turned into any desired form, and its natural state being colorless, it can be colored to any desirable shade. The name of this modern Proteus is celluloid. Celluloid is produced by dissolving gun-cotton in camphor with the aid of heat and pressure.

PAPER DOORS.—"Feel the weight of that door," said a builder to a reporter, who was looking at an unfinished apartment house up town. The reporter prepared to lift what seemed a polished mahogany door, but it proved too light for any wood. "It is made of paper," said the builder, "and, while it costs about the same as wood, is much better, because there is no shrinking, swelling, cracking or warping. It is composed of two thick paper boards, stamped and molded into panels and glued together with glue and potash, and then rolled through heavy rollers. It is first covered with a water-proof coating and then with a fire-proof coating, and is painted and varnished, and hung in the ordinary way. Few persons can detect that they are not made of wood, particularly when used as sliding doers."

BLUE GLASS AGAIN.—Only a few years ago the declaration that blue glass inserted in the windows of houses was a preventive of disease, and an invigorating agent, became a topic of almost universal conversation. The subject grew in importance as time progressed. Numerous dwellings discarded the old and present styles of white panes to a certain extent to adopt the blue, and to this day an occasional window may be seen where the blue-glass maintains its popularity. As a matter of public interest, however, after the blue-glass excitement had run its course, the subject was forgotten. It was General Pleasanton who first introduced it, but he has remained a long time silent. Suddenly he emerges from his privacy to express a renewal of his belief in the virtues of blue-glass. He says he intends to prove by ocular demonstration at the Pennsylvania State fair, that 3 year-old colts reared under it are as big as ordinary colts at five, and that all sorts of animals become larger and more prolific. When this has been done the faith of the public in the many excellencies of blue glass will be revived, but hardly before.

A NEW SYSTEM OF EMBALMING.—According to a contemporary, a remarkable discovery of a new system of embalming has lately been made which, if true, will thoroughly revolutionize this business. It consists of a rapid process of petrifaction or marbleizing of the flesh, veins and tissues. After the blood has been drained from the system the veins of the body submitted to treatment are charged with a mineral which not only, by its chemical action, changes the veins into hard stone, but before becoming entirely ossified has the same effect upon all the surrounding tissues. The idea was first discovered in Genoa by a chemist, who has already, by this method, marbleized a number of animals and placed them on his lawn. The chemicals are not very costly, and it requires only two or three weeks for them to have their proper action. The idea of being able to actually metamorphose the human body into stone, and placing it in one's garden or utilizing it for art purposes, may sound somewhat startling, but it is claimed to be based upon a sound philosophical principle.

SMALL INVENTIONS.—There is a fortune in so small a thing as a device for fastening a necktie. One of the patents in that line has just been sold to a company for $1,000,000 in cash and royalties that may amount to as much more.

HAY WATER is a great sweetener of tin, wooden, and iron ware. In Irish dairies everything used for milk is scalded with hay water. Boil a handful of sweet hay in water and put in the vessel when hot.

THE COMING PRESS.—Hoe, the inventor of the printing press which bears his name, anticipates, in the near future, the invention of a photographic press that will turn off 960,000 papers an hour.

GOOD HEALTH.

Boils.

A boil originates in the death of a small portion of the skin, which generally involves a sweat, or sebaceous, gland. Inflammation is the natural process by which the portion of dead tissue is separated from the living. The boil first appears as a red and somewhat painful nodule of skin, about the size of a bean or pea. Very soon a white point forms at the apex; swelling spreads about the center, usually attaining about the size of a dollar. At the end of four or five days, the central portion, marked by a white point, becomes loosened, and a discharge occurs consisting of a plug or core, together with matter, blood, and fragments of dead tissue. The suppuration generally ceases in three or four days.

Treatment.—Boils may often be cut short if treated early by a continuous application of ice. Dr. Eade, of London, claims to have discovered that boils and carbuncles are parasitic diseases, and that the proper treatment is very strong carbolic acid injected into the center of the boil by means of the hypodermic syringe. The best plan to be recommended for general employment is the early application of hot fomentations, by which the pain may be relieved, and the natural process hastened. When there is a great deal of general irritability, warm full baths are very advantageous.

If the boil does not open promptly, it should be freely lanced, after suppuration has taken place, as shown by softening. Warm poultices should be continued after lancing. Blind boils should be lanced and poulticed. The practice of squeezing boils is a very injurious one, as the matter is thereby dispersed into the surrounding tissues, often producing a numerous crop of boils in the vicinity of the first one. The discharge of matter should be secured by a large opening and gentle pressure.—*Good Health.*

Length of Our Lives Increasing.

At a recent international health exhibition held in London, Sir James Paget delivered an address before the association, the Prince of Wales being present.

The learned physician asserted that people live longer than formerly, and that less sickness prevails among the mass of people, and he then gives the following reasons for the decrease of mortality during the last few years:

"There is less from intemperance, less from immorality; we have better, cheaper and more various food; far more and cheaper clothing; far more and healthier recreations. We have on the whole better houses and better drains, better water and air, and better ways of using them. The care and skill with which the sick are treated in hospitals, infirmaries, and even in private houses are far greater than what they were; the improvement and extension of nursing are more than can be described; the care which the rich bestow on the poor, whom they visit in their own homes, is every day saving health and life; and even more effectual than any of these is the work done by the medical officers of health, and all the sanitary authorities now active and influential in every part of the kingdom. But we want," adds the lecturer in closing, "more ambition for health—a personal ambition for renown in health as keen as is that for bravery or for beauty, or for success in our athletic games and field sports."—*Scientific American.*

PAINS FROM AN AMPUTATED LEG.—The Dayton, O., *Democrat* of recent date says: A few nights ago a young man by the name of Clark lost his leg in a railroad accident. Since the amputation he has suffered acute pain at the knee, and declared that his leg was being twisted and cramped in the box in which it was buried. To satisfy his son, and determine whether the position of the limb in the box corresponded with the peculiarity of pain, or whether it was a simple hallucination resulting from excited and deranged nerves, Mr. Henry Clark, the father, went to the cemetery yesterday to disinter and examine the leg. As the men at the cemetery reached the box and commenced to work it up out of the ground, the sufferer turned to his friends and told them what was being done at the grave. He felt the jar of the box and the pain it caused. Out of curiosity, accurate time was kept at the bedside of the sufferer and at the cemetery, and the changes described by the young man corresponded almost to a second with those reported at the cemetery. The limb was found in the cramped position described, and he told his mother and attendants of the suffering he experienced while straightening out, and the relief experienced. When it was accomplished he dropped into a refreshing sleep. It is a curious and interesting case, and the full statement of facts should be secured.

TO REMOVE FRECKLES.—*Good Health* says: There are two kinds of freckles. Those which are produced by exposure to sun and wind are very superficial, and are easily removed by such substances as will remove the superficial cellular layers of the skin. Among the best remedies for this purpose are the following: 1.—Three tablespoonfuls of fresh-scraped horse-raddish; buttermilk, a pint. Allow to soak six or eight hours, shaking occasionally. Cider vinegar is sometimes used in place of the horse-raddish. Apply to the face at night, leaving on till morning. 2.—Two tablespoonfuls of lemon juice; an equal quantity of water; a tablespoonful of glycerine; a heaping teaspoonful of powdered borax. Apply three or four times a day, drying after fifteen or twenty minutes with a fluffy towel.

THE SOURCE OF BILE ACIDS.—According to Dr. Jensen, Pettenkofer's test for bile also holds good for peptones. It had long been surmised that the slight bitterness of the true peptones is due to the presence of bile in one of its initial stages, as manufactured by the process of digestion. Experiments have been made on boiled albumen, flesh, and a solution of gelatine, after being converted into peptones in separate bottles by a minute proportion of Dr. Jensen's pepsin. The albumen peptone gave a much stronger reaction with the bile test than did the peptone from flesh, and the gelatine peptone was almost unaltered by the test. It is thus thought that the albumen of food furnishes the chief elements for the bile. And the natural inference of a layman would be—too much bile, too much albumen.

KILLED BY GAZING AT THE SUN.—A lad 15 years of age, named John Gee, an inmate of an industrial school at Macclesfield, England, came to his death on the 13th ult., in consequence of gazing at the sun. He and another boy had tried which of them could stare longest at the blazing orb, and Gee soon complained of intense pain in his eyes and head. Toward night the pain became agonizing, and the boy died. A large number of deaths from sunstroke have been reported in recent English newspapers.

DEATH FROM PEANUTS.—A rather remarkable manner of death is reported from Lyons, N. Y. Stephen Whitlock ate enormous quantities of peanuts one day, washing them down with copious draughts of ice-water. The next day he repeated the operation, adding a lot of cherries to his bill of fare. In the evening he was seized with intense pains in the stomach, and continued to suffer great agony until death supervened. It was found that his stomach had burst.

MORTALITY AMONG CHILDREN.—At the recent Health Exhibition in London, Mrs. Ada Ballin delivered a lecture on the care of children. She said 18,000 children died in a single year from being improperly clothed, and depreciated the practice of shaking the little ones to stop their crying, which often caused serious injury. The lady also protested against rocking children in cradles, which she said tends to addle their brains and make them idiots.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

RUNNING.—Amador *Ledger*, Sept. 20: The South Spring Hill mill is again running full blast, with every prospect of continuing. Grading for the car-track is finished, and the steel rails are expected daily. Twenty stamps of the Lincoln mill are kept steadily at work. The ore is of low grade, but sufficient to pay expenses. Operations at the Mahoney have come to a standstill, except keeping out the water. It is understood that nothing more will be attempted until the injunction suit concerning the water is decided.

VOLCANO.—Amador *Sentinel*, Sept. 18: Our placer mines are now fixing up for the winter's run. Gillick is working his quartz claim and is taking out very rich rock. I think Terry has a real bonanza. I will show a specimen when I visit Jackson. The Grass Valley mine has paid very well this season; it will take about three weeks to finish the clean-up. Pioneer items: Griesbach has struck another very rich pay chute; also Henry Toop. Bowman and Denson are now in good pay ore, and the same with Johnny Klaman.

El Dorado.

RICH.—Mountain *Democrat*, Sept. 20: While in town the past week, Jerre Kendall told us that his gravel mine, near Grizzly Flat, was panning out much better than he had hoped for.

Inyo.

POLITA.—Inyo *Independent*, Sept. 20: At the Polita mine five men are now at work prospecting. Of late the indications are very favorable.

CASEY.—This mine is in the same locality with the Polita. Nine men are at work prospecting, and results of late have been so satisfactory that it is expected a mill will be built before long.

GOLDEN REEF.—During the past week Mr. Nixon has made valuable developments in Freeborn canyon. In two tunnels at different elevations a rich vein of ore was struck, the lower tunnel at a depth of 160 ft. The vein is wider in the lower tunnel than in the upper and the ore is high grade in both.

Mono.

STANDARD CON.—Bodie *Free Press*, Sept. 22: They extracted and shipped to the mill 490 tons of ore and 680 tons of tailings. Received from the ore 623 ounces of crude bullion, and from the tailings 390 ounces, which will be shipped with the present week's run.

CON. PACIFIC.—Pacific ledge No. 1 has been run 7 ft during the past week, making the total distance from the chute 67 ft. The ground is still very hard and working badly. The ledge, however, is looking more promising than usual. Some small feeders are coming in that gives ore of the value of $30. They think the prospect good for them to increase in size and quantity. Pacific ledge No. 2 has been advanced 7 ft; total distance 60 ft. Everything about the mine running as usual.

MONO.—Have cut out for and sunk the winze 6 ft below the 600 level of the Mono shaft during the past week. The ore from the winze is of low-grade—assays from 60 to 70 per cent in silver and 30 to 40 per cent in gold.

BODIE CON.—At the mill 190 tons of tailings were worked, average assay value of which is $6.50 per ton. At the mine the west cross-cut, 200 level, is in 50 ft; west cross-cut, 300 level, is in 20 ft; north drift from upraise above 400 level is in 55 ft; east cross-cut, second incline level, is in 50 ft; upraise, 500 level, is in 143 ft; upraise on Vulcan vein, 200 level, is up 20 ft.

BULWER CON.—Upraise from South drift, No. 3, 385-ft level, is up 56 ft. Progress during the week, 12 ft. The vein continues about 18 inches wide.

NEW STANDARD.—The New Standard Mine Co. is working 30 men at the mine and eight men at the mill.

Nevada.

RICH GRAVEL.—*Tidings*, Sept. 22: In digging a pit to put in a new water-wheel at the Larimer quartz mill, which mill is on Wolf creek, a mile or more below town, the workmen struck into a bed of gravel that had never before been disturbed by the pick or the shovel of the miner. Mr. Cornelius Sullivan, one of our oldest miners, was directing the work of making the place for the new water-wheel, and when the new bed of gravel was struck and some of the dirt turned, he remarked, "there is gold in that." He procured a pan and tried the gravel. The first panful of gravel yielded a half ounce of gold, the most of it being coarse of grain, but none of it being a nugget. The panning continued with the result of from $1 to $5 to the panful of gold. All passers-by were called to look at the diggings that really belonged to the "spring of '50," for Wolf creek was not a '49 creek of any great repute. There is about half an acre of this virgin creek gravel, and of course it will be worked out. It will probably be put through the Larimer mill along with the dirt under the old batteries of that mill. The whole bed of Wolf creek has been turned over time and again by the gravel miners, and how this half acre escaped undisturbed to this day is somewhat curious. This bit of mining ground will not last any great while, but it is very rich.

WASHINGTON TOWNSHIP MINES.—The township of Washington, this county, as we have frequently said of late, is to have a large number of quartz mines operating within its boundaries. All the facilities for cheaply working the mines there are at hand. There is plenty of wood and the best of water for steam-power in that part of the county, and water for water-power is abundant. We understand that recently a company of miners, who are working underground in the Idaho mine here, have made locations they consider valuable in Washington township. These men know good quartz when they see it, for they handle that kind every day, and they are very much pleased with the appearances of their Washington township locations.

A GOOD PROSPECT.—*Transcript*, Sept. 22: Charles Grimes, of this city, is the owner of a gravel claim on Deer creek, near Cooper Brothers' saw-mill that promises to be a very valuable property when once opened up. It is the old Cullovan ground. A tunnel of 320 ft in length has been run into the ridge, and an upraise of 20 ft opens into gravel with the bedrock pitching. More tunnel is needed in order to tap the center of the channel, and it will be run in due time. Recent prospects of the dirt yielded well in free gold.

Plumas.

RICH STRIKE.—Greenville *Bulletin*, Sept. 18: Last week Miles Tanner of this place made a discovery of a rich ledge between North fork and Wolf creek, on the North fork slope, about a mile above Minerva Bar, which was worked in early times and paid richly. Mr. Tanner and Mr. Thos. Davis have been searching for the ledge at different times during the past year. On the ground Mr. Tanner picked up a piece of float weighing about two pounds, from which he obtained $30. Previous to this, however, his boy picked up a small piece which he sold for $13. This led Mr. Tanner to sink for the ledge, which he struck a short distance from the surface. It is about 15 ft wide and the indications are that it is a strong ledge. The owners, Messrs. Tanner Davis and Cornell, have prospected the ledge and they are certain that the rock will pay $12 or $15 per ton. They begin work on the ledge to-morrow to make further developments. Mr. Davis has had much experience in quartz mining and he thinks they have a very rich ledge. He thinks the ledge is the same as that of the Crescent and the Indian valley mines. The ore is high grade, the gold being coarse.

San Bernardino.

OCCIDENTAL CHLORIDERS.—Calico *Print*, Sept. 13: Last Monday the leases of about twenty chloriders on the Occidental mine expired, throwing these men out of employment for the present and reducing the life and activity existing in that vicinity during the summer. Ore to the value of $40,000 was taken out in the aggregate by the chloriders, $9,000 being the net proportion received by Mr. Raymond, a handsome royalty for their use of the ground during such a brief time. The majority of the chloriders made a good profit in spite of the heavy expense attending their operations and in half a dozen places rich veins and stringers were being opened when they were compelled to cease their operations and clean up what ore they had in the mine and on the dumps. The chloriders left the mine in good condition and uncovered fine bodies of ore which Mr. Raymond can commence to take out as soon as he sets men to work in these openings, which he will undoubtedly do shortly. In some instances the chloriders threw $75 rock over the waste dump, as it would not pay them wages after they had paid all the expenses of mining, hauling and milling the ore. They owners a handsome profit after all the expenses of developing the mine are paid.

SILVER ODESSA.—Sixteen men are now at work on the Silver Odessa, sinking, running a tunnel and prospecting.

Shasta.

QUARTZ.—*Courier*, Sept. 20: Porter Seaman and the Seaman boys, together with Jewett and Kalbright, own a valuable quartz ledge situated between Rich gulch and Old Churn creek. The ledge varies in width from 14 inches to 5 ft, and is traceable by croppings nearly a thousand feet. A shaft has been sunk on the ledge to the depth of 70 ft, and a tunnel run in on the ledge a distance of 100 ft. This tunnel will be run to the shaft, which, when sunk to the depth of 85 ft, will make connection and serve as a ventilator. The owners have about 400 tons of ore on the dump. This ore is mostly free-milling but some of it contains sulphurets. The ore crushed in an arastra yields nearly $100 to the ton, and Seaman feels confident that if it was worked in a mill and put through a proper amalgamating process it would pay more. Enough of the rock for one run has been hauled to the Jones mill at Lower springs and will afford a fair milling test. Peter and Andy Cusick have been prospecting a claim near the Tower house for several years, and are now rewarded by the uncovering of an ore body which insures them a small fortune, even if no more quartz is found except what is in sight. The quartz pays $20 to the ton and they have a new arastra ready for work. The cost of working the ore will be merely nominal, as the brothers make full hands themselves.

COPPER CITY.—The mines are not run out by any means, as there is plenty of ore in sight. I think Copper City is destined to become the scene of activity and prosperity, for surely some capitalists will invest there. All that is needed is capital to erect new and improved machinery, as the old machinery now on the ground is of an old pattern, which has been condemned for several years. The ore contains a large per cent of copper, as well as gold and silver. The copper has not heretofore been worked as the machinery cannot work both copper and silver.

Sierra.

CANNON-BALL MILL.—Sierra *Tribune*, Sept. 10: C. H. Hankins is here engaged in setting up the Dyer cannon-ball quartz crusher which arrived a couple of weeks ago. It will occupy the vacant lot above Scott's hotel. Mr. Hankin's object in putting up the mill is to give mine owners and prospectors in this vicinity a chance to see it operate and judge of its merits. In other portions of the State a number of these mills are in use and from all accounts they are proving a complete success.

FRUE CONCENTRATORS.—Arrangements are about completed for the placing of eight more Frue concentrators in the Sierra Buttes mill. There are already eight of these concentrators in operation there and they give splendid satisfaction.

FOUND GRAVEL.—On Thursday of this week, a telegram from Supt. W. Lawry to H. T. Briggs, Pres., informed him that the Extension Co. had found the lead on the eastern side of the lava, or deep channel, which they have been so long crossing. Some three weeks ago a chute was started up. At a hight of 50 ft lava was encountered, but as it was raising to the east on the same slope as where the tunnel left it 140 ft back, it proved nothing except that the chute was not far enough away from the lava channel to find the lead undisturbed on its course up the ridge—that is to say, to get away from the eroding influence of the deeper and more modern channel. From the top of the chute a drift was started up the slope between the bedrock and lava. Within a dozen feet washed gravel began to come in, and soon after the bedrock began to pitch, and coarser gravel and water to come in. Where the gravel was struck is about 56 ft above the main tunnel. Had the main tunnel been run 50 ft farther the chute would have raised up in the channel, apparently. The raise is on the South Fork Co.'s ground, about 400 ft from the Extension's southwest line. The course of the channel is north, 45 degrees east, at a right angle to the above line. The company, and the people of Forest city are feeling very happy over the encouraging outlook. The raise is 6,000 ft from the tunnel mouth, at present probably the longest gravel mining tunnel, in the State. A fine prospect in coarse gold was obtained from the first car load washed.

POVERTY HILL.—*Mountain Messenger*: Judson & Kingdon, at Poverty hill, are sinking shafts to prospect their ground, and to ascertain how much their main tunnel, now 3,000 ft in gold Valley flat, is out of grade. About 50 ft from the mouth of the tunnel a shaft was sunk 12 ft through gravel, and no bed rock found. Twenty-five feet further ahead a shaft was sunk 17 ft, with a similar result. The flume is being repaired. Further prospecting will probably be done by sinking another shaft in a more favorable location on the channel. The quartz gravel is fine, and thus far no large boulders have been encountered. The gold is like flour.

took out considerable ore that ranged from $200 to $400 per ton. All the low grade ore left on the mine will pay the owners a good percentage as they can handle it with less expense than was the case with the chloriders.

OCCIDENTAL TUNNEL.—The tunnel which Mr. Raymond started in the Veto claim, and which is intended to open up the Occidental and afford better facilities for taking out the ore and waste from the latter mine is now in the hill 200 ft, and when extended about 50 ft further will be directly under the line of numerous openings made by the chloriders, and when driven 60 ft further in from this line it will be directly beneath the croppings of the ledge. Ore has been struck in this tunnel on the Veto.

GARFIELD.—The Garfield continues to turn out a large quantity of good ore daily. The force has been recently reduced to 30 men. Considerable dead work has been done in the way of running tunnels and drifting. When the ore is once found it is generally traced to some well defined strata or seam, where it can be easily taken out in paying quantities. Work is progressing in the lower tunnel which is in over 400 ft and running westerly. The upper tunnel is in over 300 ft, seams of ore having been intersected. Good ore has been found at a depth of 200 ft which explodes the theory that mineral in that section is confined to a few ft in depth from the surface. The original body of ore struck in the mine, which has yielded so many thousand dollars in bullion, shows no signs of exhaustion, and still yields returns that leave the

STRUCK GRAVEL.—*Mountain Messenger*, Sept. 13: The Germania Gravel Co., location of work on Alabama hill, after remaining idle for several years, started work last spring on a new tunnel. After running 350 ft in bedrock, the company raised a chute last week, and in 15 ft struck gravel and large boulders, with every indication of being in or near the pay channel. If they find what they have every reason to expect, they will have one of the best mines in the county, as the claim is a large one and that section of country, towards Canyon creek, is known to be rich, though this particular locality has not been much prospected. Work has been temporarily suspended at the 1001 mine, owing to a lack of water. The gravel is the best ever found in the mine. The Plumas Eureka Co. are adding new machinery to the Johnstown mill. The Virginia Co., of Howland flat, are reported to be getting very good pay.

Tuolumne.

WHAT A MAN CAN DO.—Tuolumne *Independent*, Sept. 13: Here is evidence of what a practical miner and his boy can do, Mr. John App, owner of the App mine, at Jamestown, started in to build a mill on the 24th of April last with $7.50 in his pocket. On the 5th of August he had it running—5 stamps. He ran 8 days—crushing from 8 to 12 tons of rock every 24 hours, at an expense of $1 per ton. He crushed waste rock, which had been taken out some time ago and dumped, which yielded about $3 per ton. The first run nearly paid for his mill. He is a mill-wright, and did his own work, being out only for the iron work. Being his own superintendent, boss, foreman, etc., the mill did not cost him a fortune; neither did he lay around saloons and curse his d— luck, nor did he offer to sell out for a fancy price. He knew his mine was good, and had the will and energy to work it himself for what there was in it. He says he can mine and mill the rock for $2 per ton, knows where there is better rock, and will go after it, as he can earn the means to do so out of the mine. Times are getting somewhat livelier than they have been at Soulsbyville. About 40 men are now employed at the mine, and work is being pushed as fast as possible. If some rich strikes are made it will be a lively place again. The Rising Sun mine is still shut down and is likely to remain so for some time, as Mr. Comstock, the superintendent, sent on for his things at the mine a few days ago. Rock is being hauled from the Good Friday mine to Soulsbyville to have it crushed.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, Sept. 20: Owing to indications of water in the face the main north drift on the 2800 level has been discontinued. They have come back about 20 ft and are now curving the drift to the west. Its course is now about 20 degrees more to the west than heretofore. It was yesterday out 5 or 6 ft. The incline winze is now about 20 ft below the 2800 level. It has passed into quartz, which seems to indicate that the deposit of quartz found on the 2800 level is spreading out to the eastward. The ore body on the 200 level is looking well and the amount of ore extracted has increased to 80 tons a day, or 560 tons a week. The winze is now down 85 ft below this level (the 200) and continues in good ore. Preparations are making for tapping this ore body at the 500 level.

SAVAGE.—Although the course of the large double-track drift on the 2800 level of the Hale and Norcross has been changed and turned 20 degrees more to the west, it is still aimed for the south line of the Savage. Near the old hoisting works, on a level with the branch track of the Virginia and Truckee Railroad, a tunnel is now being run which will tap the same body of ore now being worked by the Norcross folks on their 200 level. It is thought this ore deposit may be as good to the north in the Savage as it is in the Norcross; indeed, no one knows but it may even be better in that direction.

ALPHA.—East cross-cut No. 2, starting from the north end of the lateral drift on the 600 level, has been advanced through 20 ft of black dyke, and after passing through a belt of clay, quartz and vein material of a promising appearance have been encountered. The upraise has now attained a hight of 60 ft. It is following the quartz body found on the 600 level.

OPHIR.—Some ore is still being extracted from the fillings of the old drifts on the 250 level. The west drift on the 500 level has this week been advanced 70 ft. It is now out 593 ft. On the 1500 level the south drift has been extended 65 ft. In the joint Mexican, Sierra Nevada and Union Con. winze, below the 3200 level, but little progress has this week been made in sinking, owing to trouble with the donkey pumps, which have been "bucking." There will yet be three or four ft to sink next week in order to complete the sump below the 3300 level

SIERRA NEVADA.—Repairs to the drift on the 2300 level, through which passes the compressed air pipe, have been completed. They are now repairing the winze connecting the 2300 and 2400 levels, through which passes the same pipe.

BEST AND BELCHER.—The main west drift on the 2500 level is out about 735 ft. It is in a soft vein material, much mixed with stringers of quartz and seams of clay. This drift will be pushed through to the west wall. Rapid progress is making in the north drift on the 825 level, which is passing through vein material of a promising character. In due time cross-cuts will be run from both these drifts.

ALTA.—The main east drift on the 2150 level has about 50 ft to go to tap the vein. Work in the drift was discontinued for two or three days, during which time a drain was cut and boxes put in for the purpose of carrying off any water that might be tapped on cutting into the vein. A branch drift is being run to the northeast to tap the vein in Benton ground.

CON. VIRGINIA AND CALIFORNIA.—On the 1750 level the main drift has been cleared out and retimbered a distance of 350 ft west from the C. and C. shaft. From this they are now running a drift to the northwest in new ground. This drift is in favorable material and is out between 30 and 40 ft.

BENTON.—Work to the west on the 2150 level has been discontinued and a drift has been started northeast from the main east drift of the Alta. It is expected that this and the Alta drift will tap the east vein at about the same time.

CHOLLAR.—Excellent progress is being made in sinking the Chollar-Norcross-Savage shaft toward the 3000 level. It is now down about 2,955 ft.

CROWN POINT.—A considerable amount of ore of low-grade is still being found, and some prospecting is being done to open out further supplies. The water supply in the Carson river is falling off somewhat, and the mills cannot be run to their full capacity.

YELLOW JACKET.—A sufficient amount of ore is still being found to keep the mills on the Carson river at work.

UTAH.—The southeast drift on the 1950 level is still in the belt of hard porphyry mentioned last week. A favorable change is expected when this has been cut through.

BELCHER.—The old upper levels are still yielding a considerable amount of low-grade ore, and the prospecting drifts are presenting a favorable appearance.

ANDES.—Some low-grade ore is being extracted, and a good deal of prospecting is being done in deposits of quartz that are mineral-bearing.

Belmont District.

BELMONT.—*Courier*, Sept. 13: Have extracted the usual quantity and quality of ore during the past week. Have opened another stope, No. 5, which shows 2 ft of ore in the face. No. 1 stope is widening to the south. Ore is from 4 to 6 feet in thickness. All other stopes remain unchanged. Mill running well; average chlorinations, 93 per cent. Shipped 2 bars on the 10th; value, $2,408.18.

Bernice District.

MINERS.—Eureka *Sentinel*, Sept. 13: William McEwen, who has returned from Bernice district, which is some 60 miles east of south from Lovelock's Station on the C. P. Railroad, in Churchill county, tells us that there are 50 miners in the camp on day's pay, half of them working in the company's mine, the Goodwell, and the other half working at the mill. The mill hands get $3 a day and the men in the mine get $50 a month and board. McEwen says the mine is a good little property. It has made two shipments of bullion—$7,000 and $4,000—and this when it had been worked but little more than a month. The mine is stripped for a distance of 1,500 ft, and is worked by tunnels, the lowest one of which penetrates the ore body 500 ft below the surface.

Columbia District.

MOUNT DIABLO.—Candelaria *True Fissure*, Sept. 13: The east drift on the fifth level has connected with the incline and a chute will be put in in a few days. The incline is now 312 below the third level. In the east drift on the fourth level, 60 ft of track have been put in during the week, and the west drift on the second level has advanced 17 ft, and shows ledge matter in the face. The workings about winze No. 5, are giving a little ore of good grade. Winze No. 7 is now down 44 ft. The west intermediate, between the second and third levels, shows some 6 inches of $80 ore, and there is a small streak of $50 ore in the east intermediate between the same levels. In the west intermediate, between the first and second levels, a north cross-cut 27 ft long has cut a ledge of $40 ore. A small amount of ore is being taken from the east drift on the first level.

Cortez District.

LOOKING WELL.—*Silver State*, Sept. 18: J. W. Snowden, of Cortez district, was in town yesterday. He says the mines in that section are looking well. S. Wenban, owner of the Cortez mine, is building a new 15-stamp mill, and has brought water in pipes to the mill site from springs seven miles away. W. T. Clark, formerly of this place, has discovered a

very rich lead in the district, and is taking out ore that assays very high in silver.

Mount Hope District.

IMPROVEMENT.—Cor. Eureka *Sentinel*, Sept. 13: I find, after two months have passed since my last visit to this promising mining region, a marked improvement and worthy of note. Mr. Wren is doing a large amount of dead work to improve his property. He is working nine men, seven on tribute and four doing prospect work. The portion of the mine let to four practical miners shows a face and breast of ore nine by six ft, at a depth not exceeding 20 ft from the furface, and they can take out from three to five tons per day. The outlook at Mount Hope is flattering. Mr. Wren is preparing for extensive work. He has contracted for the building of winter quarters—a dwelling and boarding house, blacksmith shop, etc.

Philadelphia District.

PUSHING WORK.—Belmont *Courier*, Sept. 20: The Belmont Mining Co. is pushing the work of development vigorously in their mine at Philadelphia district with flattering results. This company has also a force of miners employed in the Barcelona at Spanish Belt and considerable very fine ore is exposed to view in that mine. Superintendent N. C. Fassett is well pleased with the prospects. The mill and leaching works are running nicely and the bullion produced is very fine.

Sherman District.

HOISTING WORKS.—Reno *Journal*, Sept. 16: Farmer Burke and Dr. Brooks, of White Pine county, arrived in Reno, Friday. Both gentlemen are largely interested with James Burke in his mines in Sherman district. They are here for the purpose of arranging to erect hoisting works on the mine and to prosecute the work of development on a more extensive and systematic scale. The developments at the bottom of the 80-ft. shaft are wonderfully encouraging. The ore body had just been cut when the miners were driven out of the shaft by water. It is the intention now to erect proper hoisting works and put in a pump so as to avoid further interruption.

ARIZONA.

COPPER.—*Silver Belt*, Sept. 20: The Old Dominion Co.'s works are running smoothly under the new administration. We are informed that a great deal of extra timbering has been done in the Old Globe mine since Sept. 1st, which greatly adds to the safety of the men employed in the mine. Work in the main shaft, cross-cuts and drifts, is being energetically pushed and the mine opened to the best advantage. The outlook in the ore bodies is satisfactory and the result of prospecting with the diamond drill unquestionably proves their continuance. There are other copper properties in this district which if developed, we are confident would prove as valuable as the Old Globe. What is needed to make this the greatest copper producing district in the world is a reduction in the cost of coke, which can only be accomplished by the construction of a railroad and consequent lessening of transportation charges.

TOMBSTONE MINES.—Cor. Prescott *Courier*, Sept. 18: The mines, from which Tombstone derives its principal support are: The Contention, which is opened to a depth of 750 ft, 150 ft below the water level. Grand Central, opened 600 ft in depth. The Tombstone Mill and Mining Co.'s properties are: The Tough Nut, Good Enough, Lucky Cuss, West Side, all of which have yielded well. Vizina Co. own the Way Up, Stonewall, Rattlesnake, Maine, Luck Sure, Tranquility, Head Centre, Ground Hog. The mines named have paid, since 1879, about $10,000,000, and are certain to yield treble that amount. Cochise county has about 100 more mines, which have "paid their own way." The Emerald, another fine property, will very soon have immense hoisting works. Mr. Gage, Supt. of the Grand Central, had about 350 men employed when we were there. Wages, $3 a day. Other superintendents were preparing to resume, and people told us that fully 1,000 miners would be working by October first. In some mines the ore bodies were 200 ft thick; ore free milling. Some of the mines are in limestone; others in porphyry. The mills of Cochise are the finest in the southwest. The general impression was, that, instead of being exhausted, the mines of Tombstone and vicinity are just scratched.

A NOTABLE STRIKE.—*Enterprise:* One of the most notable strikes of the season was made some ten days ago near Riverside, 30 miles from Florence, opposite the Ray smelter, on what is known as the Richard III. An iron ledge, 10 or 12 ft wide, showing some stains of copper, had never been explored. This year the owners, Peter Will and John Ruckleshausen, decided to work on it, and after penetrating the solid iron for some 6 ft, they were rewarded with a sight which was simply magnificent. The ore changed to a solid mass of carbonate ore running from 30 to 70 per cent copper and 10 to 20 ounces in silver to the ton. The ore body was penetrated 16 ft, with a shaft 4 ft in width, all ore and no wall on either side. Work will be resumed as soon as a windlass can be put in place. If the mine produces in the future as it has done for the last week it will be an exceedingly valuable property, being within a stone's throw of the smelter, which must eventually have this species of ore to smelt the concentrations from the Ray mine.

QUIJOTOA'S PROSPECTS.—Cor. Tucson *Sunshine and Silver*: It makes a man feel very blue to look down our mile of deserted street, lined by empty houses. Much faith is needed as well as hope. They are employing a few more men on the "bonanzas"—which have not yet earned that name, by the way—and seem to be awaiting the result of what they may find in Peerless tunnel No. 1. We need to give more attention to outside claims, and should have done so had we not been entirely blinded by the glamor of the "bonanzas." The Town Well people are sinking more rapidly in softer rock. They now make rapid progress, and the water has risen 250 ft in the well. Mr. Quiggle has been in conference with the superintendent of the mines, on the subject of the company's using this water, should hey build a mill; otherwise the town-site company will probably have a 5-stamp custom mill erected. A good idea. They also need such a mill badly at Covered Wells, where constant fresh discoveries of narrow but very rich veins are being made. Ore is being sacked there that averages $1 a pound. They say the stock of the North Peer is to be pooled in San Francisco and work thereon started. Quijotoa will be made a sort of headquarters for work on the Gunsight. The Silver Bullion mine, mill-site and town-site have been surveyed.

COLORADO.

GENERAL NOTES.—Colorado *Mining Gazette*, Sept. 13: All the mines on Seaton mountain worked under lease are paying well. So far this month there has been received at the Public Sampling works 100 tons of ore. Lode No. 1, a blind lode cut in the Foxhall tunnel, has a streak of solid ore, 5 inches, that assays in the hundreds. The August shipments from Georgetown amounted to $75,000. Silver Plume footed up for the same month $45,000. From 12 to 14 inches of nearly solid gray copper was exposed in the shaft of the Gem mine, Seaton mountain, on Monday last. The new mill now under construction at the head of Fall river, by Mr. Choate, for John Owens, is fast drawing to completion. The mill will be running in the course of two weeks. Quite a number of Ute creek properties have changed hands of late; these transfers, together with the many claims which are working under lease, give new life and energy to the camp. A shipment of ore from the Grand View lode, on Seaton mountain, to the public Sampling works ran, one ton of first class, $157; two and one half tons second class, $120. This ore was extracted by the leasers in 17 days. W. A. Doyle, who has been prospecting near the Brazil lode in Bullion camp, made a good discovery this week. The crevice is 3 ft between walls. The pay streak of 6 inches shows galena with blue and green carbonates of copper.

IDAHO.

TO RESUME RIVER MINING.—Nevada *Transcript*, Sept. 20: Supt. Emery of the Yuba River Tunnel M. Co., whose flume at Hoyt's old crossing was broken last winter, permitting many blocks to be washed away and causing a suspension of work for the season, yesterday let a contract to repair the flume and furnish 2,000 blocks for it. The flume will be ready in two weeks to resume mining.

THE VIENNA MILL.—Wood River *Times*, Sept. 16: Many more men and a greater number of families will winter in Galena this year than last. A good strike of rich ore was recently made in the Senate mine, which has given all the camp renewed hope, and several mining men who were hesitating are now laying in supplies to work all winter. More men are at work in and around Galena than ever before. Colonel Broadhead is doing very well with the Blue Jacket mine, near Boulder, the ore being much richer than that heretofore encountered. He has already shipped 140 tons this season, and is now shipping a pack-train load per day to the Philadelphia Smelting works. As others are also making regular shipments from Boulder, there is quite an excitement at that station. At Vienna the entire 20 stamps of the mill are kept busy, and yielding an average of two bricks of bullion per day, worth $1,300 to $1,500 each. A lot of Lucky Boy ore is being received for working. The owners of the mill intend to run it all winter, and to that end are getting in salt and other supplies. They already have a perfect mountain of cordwood.

A PROMISING IRON MINE.—Wood River *Times*, Sept. 16: J. Z. White is diligently at work on his iron mine up the East fork. A tunnel is being run to tap the main ledge, which will be reached in about 10 days. The Occident is an extensive lead of excellent iron ore, and increases in size and richness from the surface down as far as worked. So far there is an almost total absence of any other mineral in the ledge, but the iron itself is of a quality to inspire the owners with the brightest hopes. Work will be suspended during the winter.

CŒUR D'ALENE.—Salt Lake *Tribune*, Sept. 10: Major W. W. Woods returned several days ago from the Cœur d'Alene country. He is very sanguine as to the prospects of this new district, believing it to be one of the best of the few remaining gold districts of the country. He was met by a reporter yesterday, and in response to the question as to whether there were many paying mines there, replied. "Yes, there are quite a number. One or two claims are paying as high as $5,000 a week, and there are a number that pay from $1,000 to $4,000. The Mother lode was recently bonded for $75,000 to Leadville parties, and large forfeit money was paid down. Another claim was recently sold for $30,000, and sales are constantly taking place. Many men who own claims are too poor to work them, and in many instances there is not enough water at present to work them, even if they had the money. The claims, which are twenty acres in extent, are too large for one man to handle, and that also has a tendency to keep men from working them. A great many claims will be jumped about November, especially those on which no assessment work has been done during the past year. A number of the men who have been working on the ditches during the summer, and a number of speculators are leaving for the winter, but otherwise there appears to be no exodus. Business appears to become more and more stable every week and people who are there seem satisfied and want to remain. Everybody appears to be hopeful and there is scarcely a doubt but that the country will be a big one when it is once properly developed."

MONTANA.

AMONG THE MINES.—Butte *Miner*, Sept. 17: The Rainbow lead belongs to Walker & Co. It was located by Charles Savage in 1875, and has not yet been patented. It has been regularly represented every year since it was located. It is east of Meaderville, at the foot of the range. It has been prospected by two shafts. The ledge on the surface is 8 ft wide. The owners are now running a tunnel into the mountain to tap the ledge. The tunnel is now about 40 ft long. The ore is low-grade. The La Plata is at the top of the hill above Centerville, just west of the road to Walkerville. It used to be called one of the best mines in the camp, and doubtless is a first-class mine. It has not yet been thoroughly prospected. True, the main shaft is now 800 ft down on the ledge and the upper stopes pretty well worked out, but the lower levels have not been well prospected. Work is now going on in all the stopes. The main shaft is worked with a steam hoist. There is a shaft on the west end of the lead about 80 ft deep, which is worked with a whip. Drifting is going on in this shaft on the 65-ft level. The Lexington is one of the best silver mines in the world, and is too well known for any extended description to be made of it at this time. The shaft has been sunk 650 ft. At that depth the shaft is supposed to be about 250 ft from the vein. Cross-cutting is now going on on that level to tap the vein. Ore is being taken out from the 200, 300, 400 and 500-ft levels. They take out about 1,850 tons a month. About 160 men are employed in and about the mine. About 225 are employed in the mine and mill. At the Alice they are blasting away the rock just east of the shaft to get a place to set a large Cornish pump. Evidences of prosperity are on every hand about this mine and mill. It is as good a silver producer as any mine in the district. Its shipments of bullion every week show this. For the week ending September 13, 1884, its shipments of bullion aggregated $26,412. Besides this there were 12 bars in the safe in the office of the company yesterday afternoon, part of the production of the week that was not shipped. The mine may not be looking well—the reporter did not see it—but it certainly is producing well. The Moulton is looking well, and the mill is kept well supplied with good ore. Work is going on, and ore is being taken from the 300, 400 and 500-ft levels. The shaft is 500 ft deep. The quantity of water that has appeared in the mine has much diminished. The big Cornish pump is getting lazy; it has comparatively little to do now. The Margaret Ann is a lead that promises well. It has been worked with a shaft 80 ft deep which goes down on the lead. At this depth a level has been run 70 ft east and 40 ft west. At that depth the vein shows 8 ft of ore, 4 ft of which is high-grade. A two-compartment working shaft 100 ft deep has been contracted for; it is now about 40 ft deep. As yet, the mine is worked by a windlass. When the present contract for sinking has been filled a fine steam hoist will be put up. The Margaret Ann belongs to the Maryland and Montana M. Co. Mr. J. G. Hammer is the general manager. The company have such faith in their mine that they have contracted with Tuttle & Co. to erect and complete a 15-stamp mill. It is to be a dry-crushing mill with Howell chloridizing furnace. The Orphan Girl is now a well-known ore producer in this district. The shaft is 150 ft deep. At 170 ft a level has been run about 25 ft. The ore on that level is base. Free-milling ore at the rate of 30 tons a day is being taken out from the 90 ft level.

THE ANDERSON CONCENTRATOR.—Butte *Miner*, Sept. 13: This new concentrator has been working for some time on the tailings of the Dexter mill, and has been proving itself the best machine of the kind ever set to work in Butte. The mill has been at work on ore from the Orphan Girl and has now several hundred tons of tailings from that mine. The mill saves between 70 and 80 per cent of the assay value of the ore. The concentrator now works the tailings so nicely that in every ton of concentrates is found 65 per cent of carbonate of lead and 45 ounces of silver. Also in every 10 hours' work the concentrator saves from the tailings from $10 to $20 worth of amalgam. Three tons of concentrates are turned out in 10 hours' work. About 50 tons of tailings are worked in the 10 hours. In other words, from 15 to 18 tons of tailings are used to every ton of concentrates.

NEW MEXICO.

THE ORGANS.—Cor. Rio Grande *Republican*, Sept. 13: Strange faces begin to appear among us, who look like men that mean business. Mr. Baggs has improved machinery on the way to push development on the Galloway. The May Flower has resumed operations under contract. The Black Prince is putting on the dump from 5 to 10 tons of fine carbonate ore per day, and 5 teams are kept busy hauling it to the smelter. The Montrose has reached a considerable depth, and is showing up fine specimens of sulphurets. The Climax is a claim of special interest, well defined between walls, with 3 inches of talc plastered on the walls. Black sulphurets of good grade is the character of the mineral. The Anna Parker, one of Dallores' supposed abortions, has been sunk by the present owners, and shows a fine body of chloride and carbonate ore. The Gray Eagle, of historic fame, is an incline tunnel, and has reached a depth of 110 ft, and within the past 10 days, by the labor of 3 men, a sufficient quantity of high-grade sulphurets has been sacked to make a handsome shipment.

SHAKESPEARE.—Lordsburg *Advance*, Sept. 13: Shakespeare is very dull at present, owing to the mines not being worked (the mines never did receive much work; it was generally the stockholders that got worked), and is likely to remain so for some time unless men who invest procure the services of some good mining man. Pumpkin growers and pill-makers seldom know much about mining.

The banks of Salt Lake City received for the week ending September 17th, inclusive, $148,205.36 in bullion, and $12,538 in ore; a total of $152,743.36.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Giant and Gld Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet dasp. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

TATUM & BOWEN,

25, 27, 29 and 31 Main St., near Market, SAN FRANCISCO, - - and - - 187 Front Street, PORTLAND, OREGON.

SOLE AGENTS FOR

The Albany Lubricating COMPOUND AND CUPS,

The Albany Spindle Oil,

THE ALBANY VALVOIL,

THE ALBANY CYLINDER OIL, The Sight Drop Cylinder Lubricator.

WE ALSO IMPORT

LARD OIL, WEST VIRGINIA LUBRICATING OIL, DOWNER'S MINERAL SPERM SKID OIL, ETC.

☞ These Lubricants have been for the last eight years, and are now, in general use in nearly all the mills, mines and steamers on this Coast, and the fact that the demand constantly increases is sufficient evidence of their superiority.

JESSOP'S BEST TOOL STEEL

In Great Variety of Sizes.

ROCK DRILL STEEL in BOND or DUTY PAID

Gold Medals Awarded at Exhibitions of Paris, 1878, and Melbourne, 1881.

JESSOP'S STEEL

Manufactory: SHEFFIELD, ENGLAND. Branch Warehouses throughout the United States and Canada.

Sheet Steel, Best Circular Saw Plates, Double Shear Steel, Die Steel, Etc.

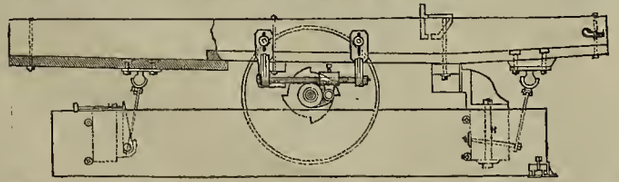
As a SPECIALTY, we offer our BEST TOOL AND DIE STEEL, annealed soft. Also, ANNEALED DIE BLOCKS from Stock, or on importation orders at Short notice.

WILLIAM JESSOP & SONS, LIMITED,
91 John Street, New York.

PARKE & LACY, Agents,
21 and 23 Fremont Street, San Francisco.

PATTEN'S

CONCENTRATOR AND AMALGAMATOR COMBINED.



This machine requires less power, less care or attention, and is less liable to get out of repair than any Concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all millmen, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

The undersigned is now located at the Ætna Iron Works, 217 to 221 Fremont street, where he is building the above machines and prepared to fill orders, and guarantee them to do all that is claimed. Weight 625 pounds; price, $300 **Estimates given and orders promptly filled for all kinds of Mining Machinery.**

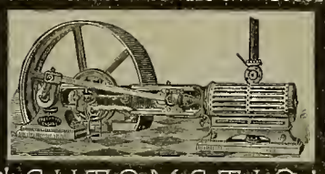
☞ Assays and practical working tests made of ores.

C. W. PATTEN, 217 Fremont St., San Francisco.

THE CUMMER ENGINE CO.

CLEVELAND OHIO

SEND FOR 150 PAGE ILLS CATALOGUE.



AUTOMATIC

Awarded highest premiums at Cincinnati and Louisville Expositions of 1883, for "Best Automatic Engine." We will furnish anyone copies of the ORIGINAL ENTRIES of several engine builders who claim they were not competing with us. They all entered in the same class with us, and now by deceptive Circulars (one headed "Fact versus Falsehood,") attempt to mislead.

☞ *No premiums were offered for Condensing Engines.*

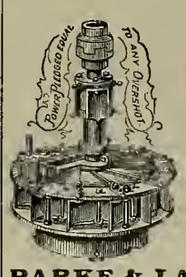
JOSHUA HENDY MACHINE WORKS, Agents for the Pacific States, 49 & 51 Fremont St., San Francisco.

JAS LEFFEL'S TURBINE WATER WHEEL,

The "Old Reliable,"

With Important Improvements, making it the

MOST PERFECT TURBINE NOW IN USE,



Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for **New Prices,** before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

PREMIUMS AWARDED.

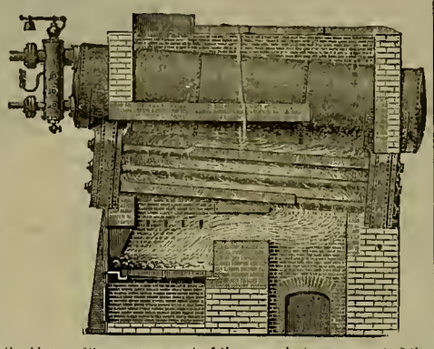
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, Mo., Sept. 28, 1883

Messrs. Adolphus Meier & Co. — GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER BUSCH BREWING ASS'N.

OFFICE OF SUPT OF ROYAL RAILWAYS,
BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 29, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

Kingsbury, self-acting gate.

CLASS 13—S. B. Laughlin, Royal baklng pans. L. H. Moise, patcut fruit steamer.

CLASS 14—Mrs. F. M. Truworthy, stencil plates. L. H. Moise, changeable rubber type.

CLASS 17—Charles Sutton, artificial stone, stamped. San Francisco & Pacific Glass Works. California engraved glass ware. B. Nathan & Co., engraved glass ware. International Tile Co., display of tiles. P. H. Jackson & Co., glass pavement.

CLASS 18—J. S. Tibbals, sewer trap. Emile Boesch, specimens of metal spinning. Alfred Thurber, Concord, Contra Costa county, automatic lamp bracket. M. Metzger, patent gas lighter. D. S. Browu & Co., duplex gas burner. B. F. Busb, automatic gas burner. C. H. & G. W. Burr, slop hopper. Geo. C. Thompson, soda fountains. Albrecht & Waters, stove-pipe shelf and support, steel-edge dust pan. Dutton & Son, patent gas key.

CLASS 19—C. Weston, display of the Arch fire kindler. J. Hatch, samples of shaper work and sawing. T. Duffy, rustic work and gas logs. C. H. and G. W. Burr, weather strips. J. W. E. Howe, imitation wood and marble table tops. Geo. P. Ashton, portable conservatory. Louis L. Hall, specimens fret sawing. Mrs. Harrict W. R. Strong, Bedford window attachment. Geo. F. Atkinson, articles turned from Pacific coast woods. Atwell Manufacturiug Co., sash lock and ventilator.

CLASS 21—M. J. McCue, carriage blacksmitbing. Waterbouse & Lester, wagon wheel. F. C. Milliken, dump-wagon. R. N. Coughell, spoke extractor. A. W. Sanborn, display of imported wagon work. J. McLaughlin, improved shaft or thill coupling.

CLASS 22—F. Rentzcheller, carpet rockers. C. H. Townsend, kitchen tables. Fay & Co., extension tables. Otto Einhoff, inlaid secretary. Pacific Spring and Mattress Co., Turkish chairs. T. S. Clark & Co., wire-coiling machine, carpet lining, stair and mattress pads. Mrs. Carrie Morse, double crib. Pacific Spring and Mattress Co., parlor suits. Haywood Bros. & Co., display of Rattan goods. B. F. Farrar, general display of bed room sets. Pacific Spring and Mattress Co., sofa beds.

CLASS 23—P. Lieseufeld, best billiard balls, cues aud racks.

CLASS 24—Coos Bay Stone and Lumber Co., beer coolers, ice chests and refrigerators. Keystone Wringer Co., wringers and carpet sweepers. Weister & Co., display of house furnishing articles. B. F. Van Amringe, magic window screen. Buchanan Bros., display of brushes, California make.

CLASS 25—Gillispie & Childs, tule iuner soles for shoes. Main & Winchester, horse collar. Kinkler, Schoening & Co., leather for buttonhole lining.

CLASS 26—Californuia Silk Culture and Development Co., display of raw silk. W. R. Gallup, Spanish merino wool. Julius Weyand, specimens of mohair. California Wool Scouring Co., samples of scoured wool. H. Liebes & Co., samples of furs, cleaned or colored. Mrs. J. P. Henderson, ermine trimmings. California State Wool Growers' Association, display of wool. J. H. Glide, Spanish merino wool. Frank Bullard, Spanish merino wool. J. B. Hoyt, Sbropshire and crosses between Sbropshire and Spanish merino wool.

CLASS 28—J. M. Litchfield, military goods, display of regalia.

CLASS 29—Madame Soutenir, feathers, wings and birds.

CLASS 30—The Tecbnical School of Cigar Manufacturers' Association, cigar manufacturing. Mrs. C. Murray, display of Turkish tobacco and Latakia cigars.

CLASS 31—Downing & Son, display of Murray & Lanman's Florida water. H. B. Slaven, display of fruit salt and perfumery. Kalliodont Manufacturing Co., display of dental toilet preparations. California Volcanic Mineral Water Co. (Castilian), best natural medicinal water. Mrs. H. M. Rutberford, engraving fluid. Royal Mustard, Oil and Drug Works, display of mustard and mustard oil.

CLASS 33—H. B. Birnbaum, Cibil's extract of beef. Scott, McKean & Co., agents Moore & Brady, Baltimore, M. D., deep sea oysters. J. Morton, Jr., Parisian sauce. Richards & Harrison, sea-firing apparatus. Castle Bros., breakfast gem. Mrs. L. H. Moise, display of preserved fruits in glass.

CLASS 34—Arpad, Haraszthy & Co., best Reisling wine, 1881, 1882. Same, Zinfandel table claret. Same, best port wine, unusually dry. Same, best Angelica wine. J. H. Drummond, best red wine, Burgundy type, vintage 1881, remarkably fine. Same, France Pinot wine 1883. Same, red wine, 1881, (table claret). Same, best white wine. Same, Sauterne, 1882. Same, Gutedel, 1881. H. Lachman & Co., Gutedel wine, vintage 1880. Same, Madeira, 1876, best wine on exhibition. Same, Muscat, 1876.

CLASS 35—A. Fenkbausen & Co., old Pioneer whiskey. A. Fenkhausen, rum punch. Same, Sweedish bitters. Wm. Goeppert & Son, Bavarian Felsen beer.

CLASS 36—F. A. Labadie, map of the Mexican States. J. C. Merriam, display of maps and atlases. Wm. M. Cubery, display of society cards. J. Clayton, Quaker cook book.

CLASS 37—Nat. Raphael & Co., display of the "Mechanic's watch."

CLASS 38—Cal. Electrical Works, best electric pen. Electrical Supply Co., best electrical turn-table. John Roach, drawing instruments.

CLASS 39—Wm. Beeman, assortment of trusses and bandages. Pac. Electric Co., electric truss.

CLASS 40—Louis Anderson, best woolen mat. Miss Annie Allen, tapestry picture. Miss S. A. Armstrong, embroidered sofa cushion. Mrs. William Lyne, rustic tables. Misses E. and R. Murray, display of natural ferns and grasses. Mrs. Mary Cumming, silk table cover of national flags, embroidery and crazy patcbwork. Miss Gertrude Field, best display amateur wax work. Mrs. P. A. Fish, crazy quilt. Mrs. Johu Fulton, painted table drapery. Jacob Fretsch, best collection of sbell work. Mrs. Emma George, crochet work. Mrs. L. P. Garcin, crochet tidies. Emma Hare, darned net. Mrs. J. P. Henderson, ermine trimming. Miss V. Huppert, wax poud lilies. Mrs. M. B. Henderson, hair work. Fannie Kalisky, embroidered table cover. Mrs. C. W. King, crazy table cover. Miss Maria Langrehn, pictures in embroidery. Clara Leal, aged 9 years, crochet tidy. Mrs. B. Mortensen, spread and bureau pieces. Francisco Martinez, Spanish straw work. Silvia Rattenzi, worsted embroidery, linen embroidery. Mrs. Sol. Runyon, net work. Mrs. H. L. Rosenblum, patchwork. Mrs. H. E. Steerer, afghan. Miss F. Shamp, hand-made lace. Bertha White, 11 years of age, crochet tidy. Mrs. M. Bucelli, crochet work. Mrs. R. Baker, sofa cushion. Mrs. S. A. Brown, crazy quilt and shams. Miss Maggie C. Corr, 30tb and Mission, air castle. Miss Carrie Christie, tapestry picture. Miss Annie Cecil, autumn leaves. Mrs. R. Baker, knitted bed spread. Miss Theresa Corlett, skeleton leaves. Mrs. J. E. Cotter, sea mosses. Emma D. Cork, best specimen of wax work, bouquet wax flowers. Miss Annie Davis, worsted wreath. Mrs. Georgie Davidson, crochet quilt and shams. Mrs. Mary Ebeler, best crochet spread. Mrs. M. Erens, knitted lace, yoke and sleeves.

CLASS 43—James Linforth, samples of white bronze monuments. M. Roth, best statuesque (home production). Richards & Harrison, Japanese art statue. J. K. Newton, meerschaum pipe. Mrs. S. F. Neil, modeled mirror. Miss A. Carter, painting on plush. Richards & Harrison, Japanese art statue.

CLASS 44—A. Hoffmann, steel engraving. Nellie L. Scribner (6 years of age), crayon drawing. Eva E. Scribner (10 years of age), crayon drawing. Carl Eisenschimel, pen drawings. G. B. Bernard, specimen of penmanship and lettering. Miss E. McMahon, map drawing. W. H. Smythe, original mechanical drawing. Pupils of Madam Zeitska's private school, free-hand drawing. E. McD. Johnstone, engravings on coal.

CLASS 45—Ada A. Brewster, pencil drawings. Mrs. M. K. Irving, crayon portrait. Miss Lizzie Smith, colored pbotographs. Mrs. Plummer, enameled pictures on glass. Ada A. Brewster, pencil drawing. Mrs. M. K. Irving, crayon portrait.

CLASS 47—Ira F. White, seedling peaches. Silas McLaughlin, fox cliug peaches. M. A. Walton, peacbes. M. Vulicevich, native and imported fruits. Ira Davenport, native fruit. L. Lazarus, peaches. James Collins, samples of fruit. Immigration Association of California, natural products, display of cereals, display of fruits, fresh and preserved.

CLASS 56—Miss Sadie Baum, floral design, "picture, framed on easel." Mrs. J. Darling, floral bouquet. A. Duhem, display of cut flowers.

Cash Premiums.

Brooks, Norton Bush, Miss S. E. Bender, Mrs. J. E. Brown, Miss Ada Brewster, Miss. E. Bartholemew, W. Behringer, Miss Alice Chittenden, Chas. J. Carlson, Mrs. S. M. Campion, W. A. Coulter, G. Cadanasso, Miss M. E. Casey, Edwin Deaken, C. De La Berry, W. O. Emerson, H. R. Fish, L. Fitzgerald, Felicite Fortier, Mlle. P. Granjeau, A. Goldenson, Thomas Hill, Mrs. W. L. Higgin, Mrs. E. C. Hatch, J. Hecht, T. L. Heath, Mrs. Wm. Ireland, Alfred Jenks, T. Kago, Miss Jessie Kirk, Miss Rosa Lewis. Miss Clara McCbesney, M. H. Moore, E. Narjot, Arthur Nabl, Miss Annie Oesterman, Ada Piatt, Miss Emily Ryder, M. Strauss, S. W. Shaw, Miss Susie Sroufe, Miss Emilie Stallman, F. Shafer, Mrs. R. R. Vansano, Miss Dora Vassault, Mrs. A. E. Wilson, Virgil Williams, Mrs. Dora N. Williams, William Winter, J. B. Wandesforde, Miss A. Williams, Cas. T. Wilson, R. D. Yelland.

Mining Share Market.

The San Francisco Stock and Exchange Board will probably relax its rules, in a manner which shows to what a picayunish state the mining stock business has arrived. A resolution has been introduced which reads that on all stocks under the record value of $1 per share, bids of one cent advance or decline may be made from this time forward. The rule since the inauguration of the board has been that no bid of a less amount than five cents could be made on any stock under a value of $5, and one-eighth on al stocks above that price. The one-cent rule has prevailed for years in all the Eastern exchanges.

The topic of the week on stock circles has been the contest for the control of Chollar. For the past four months a rather ill-tempered struggle has been carried on for the control of certain Comstock mines — the Ophir, Mexican, Chollar and Potosi levels being the principal theater of action, and the Nevada block people and Sharon being the participants. It having been represented to Judge Wilson that a change of officers was necessary, the representations coming from the anti-Sharon stockholders represented by Alvinza Hayward and W. S. Hobart, his partner, the Judge issued an order for a meeting, at which if it were found that a majority of the stockholders so desired, an election of new Directors might be had. The result of this meeting this week was, that the old Board of Directors was removed. These Directors were: A. K. P. Harmon, President; J. D. Fry, William Norris, J. H. Dobinson and C. L. Weller. With the sanie unanimity the prepared list of new Directors was balloted for, and Dr. Dutch, Alvinza Hayward, R. Wilson, A. W. Rose, Jr., W. E. Sell and C. T. Bridge were declared the new Directors. The Sharon faction was therefore defeated, but the matter is not at an end yet.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

305,375.—HEAO-REST FOR WATER-CLOSETS—Wm. Cummings, Sacramento, Cal.

305,055.—QUARTZ-CRUSHING MACHINE—C. Dandurand, Virginia City, Nev.

305,379.—BOLT-DRESSER—Henry Eyeberg, Napa, Cal.

305,166.—COLLAR-STUFFING MACHINE—Calvin Ewing, San Francisco, Cal.

305,179.—HORSE-COLLAR—Thos. F. Hagerty, San Francisco, Cal.

305,308.—GAS-MAKING MACHINE—A. and T. Henning, Sacramento, Cal.

305,193.—SIDE-SPRING VEHICLE—Z. M. Howell, Salida, Cal.

305,081.—GRIPPER FOR ENDLESS-CABLE RAILWAYS—W. W. Kendall, San Francisco, Cal.

305,203.—GRAIN-SEPARATOR—A. W. Lockhart, Stockton, Cal.

305,098.—SIGN—G. W. Menefee, San Francisco, Cal.

305,323.—STEAM-ENGINE GOVERNOR—Wm. R. Michener, Benicia, Cal.

305,226.—BUILOING CONSTUCTION—E. L. Ransome, San Francisco, Cal.

305,112.—PRESS-PAD FOR PANTALOONS—S. C. Rugland, San Francisco, Cal.

305,248.—HOISTING-CRANE—A. J. Stevens, Sacramento, Cal.

305,114.—WIND ENGINE—H. K. Stevens, Los Angeles, Cal.

305,250.—JOINT-PROTECTOR AND IGNITER FOR FUSES—E. A. Thompson, Silver City, Idaho.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security in and the shortest possible time.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faitbfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this offices at pub'ished rates.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufac ture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.
2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough oil to prove what we say. Our oil has now been adopted as

Cheaper, More Economical, and More Serviceable than any other Oil

WHAT IS THE DIFFERENCE BETWEEN "PEBBLE" AND "GLASS" IS ASKED EVERY DAY.—"Pebble," which always retains its transparency, is much more highly prized for its greater hardness, and being cooler and possessing greater refractive power, a better conductor of heat than glass. "Glasses" are more or less influenced by the damp state of the atmosphere, become turpid, soil more readily, thereby rendering them more difficult to keep clean, and much more liable to become scratched in use. The nature of the material of which lenses are made can be best ascertained by determining the co-efficiency of light; by placing the lenses between two plates of tourmaline, called pebble test, which neither the flint or crown glass can the light pass through, showing the greater transparency of the pebbles over glass; of course taking for granted that where "rock crystal" is used, if not homogeneous, but of a stratified growth, that the lenses will be cut at right angles to the axis of double refraction, as such lenses would be bi-refringement and split up a ray of light, making them very injurious to the sight and having no advantage over glass, only in cheapness. "Rock crystal" lenses badly cut, either through carelessness or design, in order to cut the largest number of lenses from a given piece of rock, may be found at the Cheap Johns and other venders of spectacles, claiming for them all the good qualities possessed by the justly celebrated Pebble Spectacles, obtained only at C. MULLER'S Optical Depot, 135 Montgomery street, near Bush, opposite the Occidental. 4

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The **genuine** has stamped on every sheet "**Jenkins Standard Packing**," and is for sale by the Trade generally.

Manufactured only by

For Sale by DUNHAM, CARRIGAN & CO., San Francisco, Cal. } JENKINS BROS., 71 John St., New York.

SQUARE FLAX PACKING.

Entirely Exempt from Hemp or Jute. Softest and Most Pliable Packing Made. Does not lose its Strength when worn by the rod, and does not Scatter or dissolve by power of Steam or Water.

Sufficient for a Trial will be Furnished, Free of Charge.

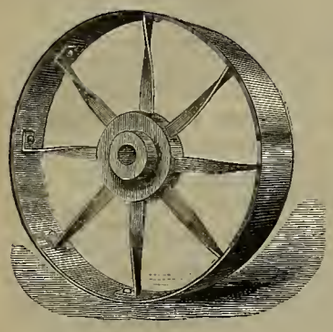
Iron and Machine Works.

MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), } LEIGH, ENGLAND, Nov. 5, 1883. }

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,

For the Mather Lane Spinning Co. (Limited),

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE
Cheapest and Most Effective Machine
OF THE KIND NOW IN USE.
Adapted to All Grades and Classes of Ores

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coaser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

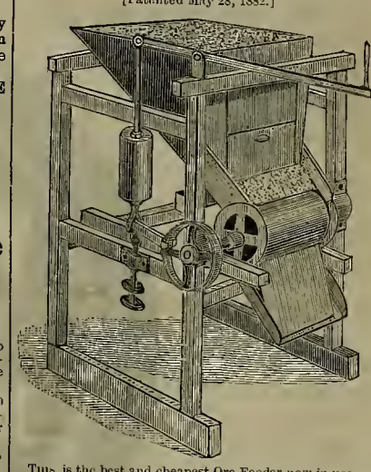
A Great Triumph!
WON BY THE MANUFACTURERS OF THE
EUREKA CEMENT,
GOULD & HILL, Proprietors,
103 and 105 Fremont St., San Francisco.

On the 25th day of August, 1884, Judge Sabin, of the United States Court of Equity, decided the great infringement case of the Salamanda Felting Company of New York and Philadelphia vs. the EUREKA CEMENT, in favor of the EUREKA CEMENT. This decision is one of the most important that has been rendered for many years, because it gives Messrs. GOULD & HILL the unrestrained right to continue the manufacture of the BEST COVERING FOR STEAM BOILERS AND PIPES that is known to the world.

THE ROLLER ORE FEEDER
[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

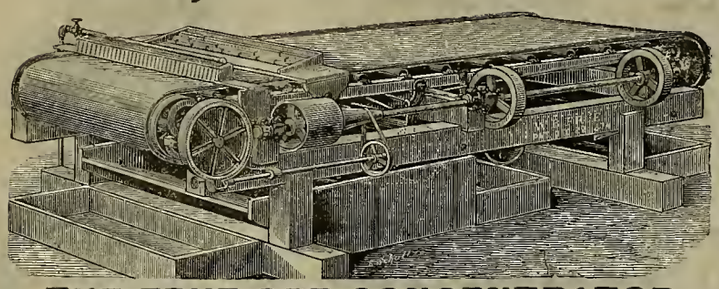
200 to 10,000 Gallons a Minute.

SAN FRANCISCO TOOL COMPANY, - - 11 Stevenson Street, S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

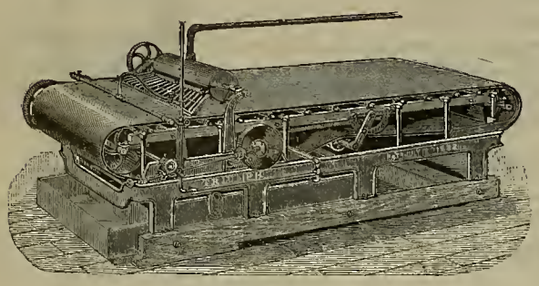
The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $109.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

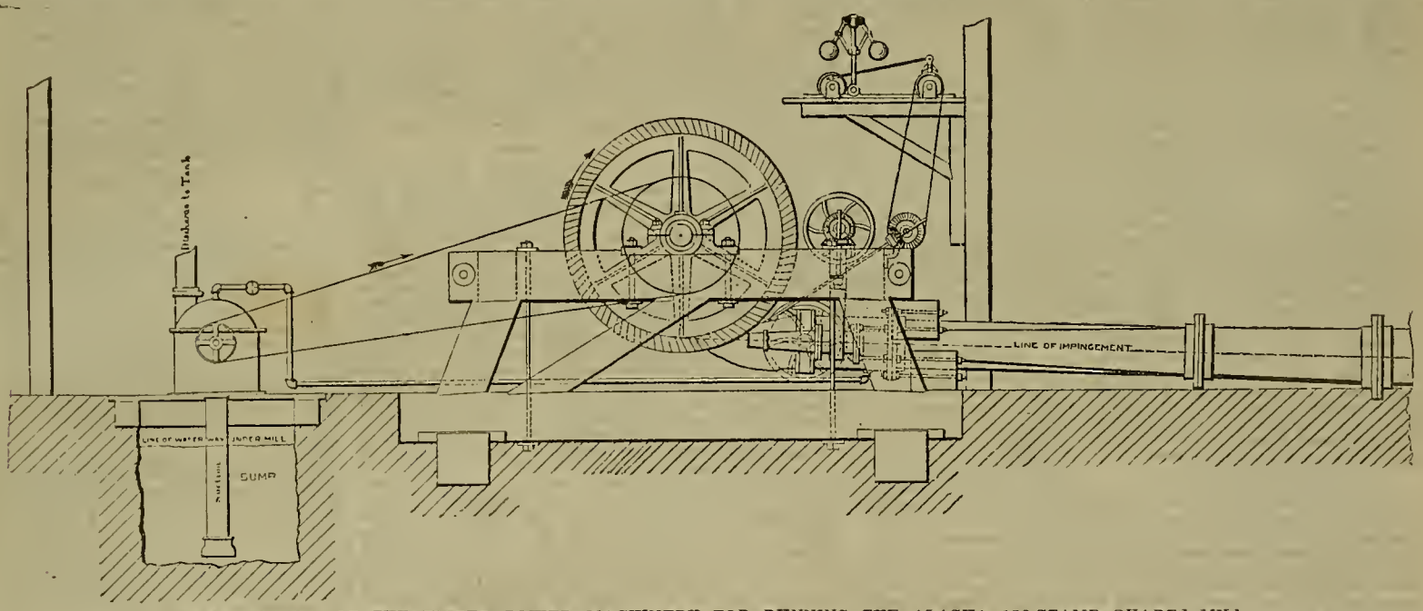
VOLUME XLIX. Number 14.

Water-Power Machinery for the Alaska Mill.

In the last number of the MINING AND SCIENTIFIC PRESS we gave a description, with illustration, of the new 120-stamp mill of the Alaska Mill and Mining Co., now being erected at their mine on Douglas island, Alaska. It was stated in that article that we should give some details concerning the motive power of the machinery, water being used instead of steam. On this page we give an engraving representing an elevation of the water-power portion of the plant, and on page 213 is a plan view of the same.

The Alaska M. & M. Co.'s plant consists of a 120-stamp mill, with 48 Frue concentrators, all necessary feeders and breakers, electric light machinery and machine shop, together with pump for supplying battery water. This machinery is to be driven by not less than 250 miners' inches of water under a head of 380 feet, which comes from a ditch about 1,500 feet from the mill, and is conducted thereto by means of, first, a 22-inch pipe, and then an 18-inch pipe, leading to the water-wheels. The management, desiring to have a reserve power in case of accident, decided to put in both a Knight wheel and a Pelton wheel, each six feet in diameter, upon the same shaft, and either of these wheels will develop the necessary power at a moment's notice. It is the intention to run but one wheel at a time, holding the other for reserve, and during the low stage of water the one will be used that takes the least water. Inasmuch as these wheels are keyed to the same shaft, and under precisely similar conditions, no fairer test of the relative economy of these wheels can be made. The shaft is six inches diameter and held by three boxes, 16 inch bearing and 500 lbs. weight each, thus insuring steady running. The wheels make 236 revolutions per minute, and the power is transmitted by means of sixteen two-inch ropes running on four-rope sheaves, keyed to the same shaft as the wheels. The battery water is raised 28 feet from the wheel pump by means of a balanced turbine pump capable of delivering 1,600 gallons per minute, this pump being driven directly from the main shaft, as shown by the 8-inch belt. It being of the utmost importance to maintain a uniform speed to the shafting throughout the mill, a governor has been placed on the Knight wheel, as shown, and it operates by contracting the nozzle, forcing the water to escape through a small opening, but not injuring the pressure, as the water is not throttled in the least degree. The nozzle of the Pelton wheel being round, renders present methods inadequate to supply a proper governor, and it was omitted. Either of these wheels will develop with ease not less than 250 horse-power, and as much more if required. Every attention has been given to make this plant the most perfect of any on the coast. The whole of this portion of the outfit was designed and built by Edward A. Rix & Co., 18 and 21 Fremont street, San Francisco, who make a specialty of such water-power appliances.



ARRANGEMENT OF THE WATER POWER MACHINERY FOR RUNNING THE ALASKA 120-STAMP QUARTZ MILL.

Electric Blasting.

In preparing an artificial lake or reservoir to add to the water supply of Liverpool, a large stone dam is being built, some 70 miles from the city, and the quarrying operations in obtaining the stone for the dam are quite extensive. The quarries are lighted by electricity, and the fluid is also used in blasting operations.

The beds of rock lie in a way which peculiarly adapts itself to electric blasting, and this has been adopted to the almost total exclusion of the ordinary methods by means of a fuse, which is only used in isolated and special cases. At first the Welsh quarrymen and foremen were much prejudiced against its employment, and used every means to discourage its introduction. The engineer has succeeded, however, in carrying his point, and a man and a boy have now been trained, and are almost constantly employed in preparing the fuses and firing the shots. The battery employed for firing is one of Siemen's high tension, and resembles when open a small dynamo, being driven by a handle and train of wheels, and to which is attached a condenser, consisting of alternate layers of mica and tinfoil. The electricity stored in the condenser is automatically discharged at every third turn of the handle of the machine, and passing along the wires and through the fuses, fires the holes simultaneously. As many as 50 holes can be fired at once, but in practice it was not found advisable to couple more than 30 together, owing to the difficulty of isolating so many, and the consequent short-circuiting of some of the holes, thus spoiling the blast and necessitating their subsequent firing. The holes as a rule are nine feet deep, one and one fourth inches diameter, three feet apart, and placed at a distance of nine feet from the edge of the rock. The men stand on a line of planks along the slope when preparing holes for a blast. Thirty of these holes would bring down a mass of 576 tons of rock, in blocks from three to five and ten tons, those from three to seven tons being the most useful, as if they were over seven tons the cranes used in building are unable to lift them. A great deal of waste is occasioned by breaking up large stones, as one of eight tons cannot be broken into two good stones of four tons, and sometimes the effort to do so is simply wasted. In order to prevent, as far as possible this waste, owing to the blocks being too large, much judgment and experience are necessary in choosing the best site for the holes, and after many trials the above dimensions were adopted as affording the best average results.

MANUEL EYRE, a stockholder in the Day Silver Mining Company, has sued Geo. W. Beaver, Thomas Cole, J. D. Browne, A. K. Grim and Henry A. Fox, Directors of the Company, charging them with neglect of duty, in failing to make reports required by law; that by such failure and neglect the defendants became liable to plaintiff in the sum of $1,000, for which sum and costs of suit, he brings suit.

THE business portion of Rathdrum, Idaho, near the Cœur d'Alene mine, was destroyed by fire on the 28th inst.

Shipping Copper Ores.

Although Great Britain is the great copper market of the world, she is by no means a great copper producer from her own resources. The mines of that country formerly produced much more than at present, but their product has steadily declined under the heavy receipt of ores, furnace products, precipitate and bars from other countries. She now produces about 50,000 tons of ore a year, yielding between 3,000 and 4,000 tons of copper, mainly from Cornwall. The influence of Great Britain as the leading copper market of the world is due to the enormous quantities of crude metal, furnace products and ores it handles, which go there from all over the world. The great metallurgical, chemical and manufacturing industries place it in a position to work black copper, regulus, mattes, and ores for fine metals, and re-distribute a large portion of it in the shape of manufactured copper, cheaper than the countries in which the raw material originates and to which part of it returns.

The material which comes there from Chili, Canada, Australia and Cape of Good Hope is chiefly regulus. The ores are shipped from many quarters—Italy, Venezuela, Chili, Bolivia, Cape of Good Hope, British North America and the United States. In 1882 she received 103,263 tons of ore, valued at over one million pounds, and averaging about 15 per cent. This was ore alone. The lowest grades of ores come from Canada, while Italy and Venezuela supply a medium grade. It is thought the Cape mines cannot maintain the high grade of their ores much longer. Cuba no longer ships any, and Australia smelts at home and ships chiefly refined copper. The black and refined copper go from Chili and Australia. Montana ships high grade ore. British India is the best purchaser of English copper and its manufactures, while France takes the greatest quantity of crude metal, followed closely by Germany.

THE tramps scattered over the Territories are coming to California to winter.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents. — EDS.

Butte City, Montana.

A General View of Montana Territory, and a Glance at the Resources of Butte City.

Looking at the map of the great Northwest, and centering attention upon the Territory of Montana, one wonders at the probable future of that mountain-ribbed, vast-plained commonwealth. The western spur of the Rocky mountains, at its summit-line, is the boundary between this Territory and Idaho on the west and southwest, while for nearly 500 miles it touches Wyoming on the south. Twelve degrees of longitude, or 830 miles, are embraced within its northern boundary on British America, and nearly four degrees, or 270 miles, within its eastern boundary on Dakota Territory. Its area in acres is stated to be 90,000,000, of which 25,000,000 are arable, and many more millions are capable of sustaining vast herds of stock. Surely these are magnificent figures, and increase one's desire to analyze with some closeness the resources of this inland empire, to ascertain whether the enumerations are mere idle calculations of superficial areas, or the portents of a division within our galaxy of States rich in all that goes to make up a prosperous and happy people.

Early Explorers

and even travelers or residents of the present generation, tell us of the immense herds of buffalo and elk that peopled the plains of central and northern Montana. The slaughters by hunters and the advance of civilization have caused these to be succeeded by other vast herds of cattle and sheep, which here find free pasturage upon the luxuriant bunch grass that is so abundant; and now cattle kings of great wealth are coming to be one of the features of the Territory. The plains spoken of are cut and crossed by mountain spurs, and are watered by great or small rivers, so that there are well-defined regions, with distinct names, which make the local geography of the Territory a veritable Chinese puzzle to the transient visitor or the new-comer. Many of the river valleys have bottom-lands of great fertility, where ample crops of cereals may be or are raised, the fact of their cultivation depending entirely upon the local market. Where adjacent mining camps make a market secure, there we find agriculture flourishes; where this is not the case, these tillable lands are allowed to lie idle, or are availed for pasturage, until a home market shall be created. For Montana can hardly hope to compete with the grain fields of States and Territories nearer to the centers of population or to shipping ports for the foreign world. Transportation is too expensive as yet for that condition of things. Thus, in a general view, we have in Montana a Territory which, as to agriculture, will ever keep pace with its own development in other directions, and in this respect it may be counted an independent and self-supporting region.

The Timber Resources

of Montana are also vast. Their computation is a study for the statistician. One authority places the area of timbered lands at 40,000 square miles. From personal observation, we know that much of this area is as densely covered with trees as seems possible. The timbered region is on the western divide of the main range of Rocky mountains; the eastern divide is untimbered, except in strips along many of the water courses. Although vast quantities of lumber have been used in the mines and smelting furnaces and cities of the Territory, and by the railroad companies, the resources in this direction are practically untouched, and it is a mooted question now, if the growth of young pines in the places charred by fire or by cutting is not equal to the present consumption in parent forests. Figures in this line are idle, except to practical lumbermen, so it is sufficient to say that the work of wood-cutting and sawing gives employment to many of Montana's population, and it is an industry that will endure for generations to come.

Thus, in the two resources touched upon, we have elicited facts which may well challenge the attention of our whole country. But we have yet to mention the prime factor in the late growth and prosperity of this one of our several great Territories. The mineral resources of Montana are what create wonderment in the minds of all seekers for information; it is as a mineral-producing Territory that she is coming chiefly to be known. In this line, as well as in that of agriculture, we must deal with the different districts or communities separately, if we would be thoroughly informed, as the discussion cannot be done in a few paragraphs, nor in the form of generalities. Especially is this the case when we look at Montana's development in the line of a mineral producer. We write from Butte City, the mineral metropolis of the Territory, if not of the Pacific coast, and shall, as opportunity offers, speak of other localities as we proceed in our travels.

Butte City.

Butte City is the county seat of Silver Bow county, in the southwestern portion of the Territory. It lies so surrounded with hills and mountains, in a mountainous region, that its connection by rail with other parts of the country has been slow, and has only been consummated within the last year or so. This is one reason why the natural mineral resources of the locality have not before this been developed to their present extent, as Butte has been known as a region of great promise since 1864, when the first settlement was made, some seven miles from the present site of the city. But at that time these were placer diggings and the mining in that direction reached its hight in 1867, after which there was a lull in the mineral development of the region, until the quartz rock began to be worked, and the camp was started on a growth which has ever since been maintained. At present, railroad communication with the outer world is given by a short branch line of the Utah and Northern R. R., from Silver Bow junction, from which point one may go to Garrison, on the Northern Pacific R. R., or to Ogden, on the Union Pacific R. R. The U. and N. R. R. is a branch or feeder to the Union Pacific, and a very important feeder it is getting to be. Butte lies on the southern slope of a considerable hill, and overlooks Summit valley, through which flows Silver Bow creek. This mining district is known as the Summit valley district. The elevation of Butte above sea-level is about 6,000 feet, so that it has a decidedly mountain climate, and lies, as one realizes at times, in the region of the clouds. Its present population is from 10,000 to 12,000, made up largely of workers about mines, business men and their families, and the usual floating population that gathers into a flourishing mining camp. It seems to be a well governed, orderly city, but there are apparent some of the customary vices that are countenanced in cities of this character. Still, in a two weeks' visit, one might easily see more ruffianism in any of our great cities than will be seen here within the same time. In the matter of business, there is a steady and lucrative trade for most of the mercantile houses. It is said that the pay rolls of the mines aggregate $600,000 per month, which goes mainly to some 3,000 miners, wood-choppers and teamsters. The circulation of this amount of money stimulates legitimate trade, as well as some occupations that are not so legitimate. We believe that the extent of business done in Butte is not generally fully appreciated outside the Territory, or by those who have not visited the city. The place has grown to its present dimensions without any flurry or boom, and the methods of conducting mining enterprises are entirely in harmony with this quiet method. Mining here is a business, not speculation. The mines are not run upon the assessments taken from the pockets of distant stockholders—assessments are contrary to the statutes of the Territory. False coloring is not given to reported discoveries in the mines, but these discoveries or workings are mostly kept within the confines of the business offices of the properties concerned. So all is calm, and business-like and in the main solid.

The First Discovery

Of mineral-bearing quartz was made within the present site of the city, and subsequent discoveries and developments have not been extended beyond a circuit of more than a mile or so from this original location. The number of locations made within this small radius is astonishing, and no further progress in the mines need be made to decide that the entire region is thickly ribbed with veins of metal-bearing rock. The number of locations exceeds 4,000, while the locations patented reach fully 1,500. The most profitable of these locations are on what seem to be four main parallel ledges, which run east and west across the district, and are some 1,000 feet apart. Many assert that this idea of four such ledges existing continuously is somewhat theoretical; but certain it is that the larger works of the camp lie on such parallel lines, and it is thought that, in the future, underground connection may be had from mine to mine along these ledges, the same as such connection is now had along the Comstock lode in Nevada. Taking up first the northern of these lines of works, we have the Moulton, the Alice, the Fraction, the Magna Charta, the Valdimere and the Poser. Next, about 1,000 feet, is the line made up of the Lexington, the Allie Brown, the Josephine, the Burnet, the Mountain, the Bell, and others. Still farther south is the great copper belt, on which are situated the Original Butte, Gagnon, Parrot, Anaconda, St. Lawrence, Mountain View, and probably the Colusa, Liquidator, etc. The fourth, or southern system, forms what is called the Black Cliff lode, of vast extent, but as yet not so fully developed as the others. Running almost parallel with these four lode systems are hundreds of claims of less extent, but, as a rule, of considerable richness, as far as they have been explored.

Considerable foreign capital has come in to assist the development of the mines at Butte. Of 13 of the leading companies operating here, 5 have their head offices in the East or in Europe, while in the case of the 7 having headquarters at Butte, Eastern capital has a large influence. But the mammoth enterprise of all—the Anaconda—is controlled by San Francisco capital and enterprise, and has its head office there.

The limits of this article preclude a consideration in detail of the various qualities of ore taken out of the different mines and the method of their treatment, that being a subject warranting special and separate consideration. We here shall limit ourselves to a more or less detailed statement of the condition of the leading properties of the camp, with some statistics gleaned by personal solicitation or borrowed from authentic sources.

The Anaconda.

This mine lies high up on the hill to the northeast of town. The property includes the St. Lawrence mine, which joins the Anaconda on the east. It also includes mammoth concentrating and smelting works at the town of Anaconda, some 20 miles away, to which point the ore is to be carried by cars, to the extent of 500 tons or more per day. Heretofore the high-grade ore of these two mines has been shipped to Swansea, or some point in Europe, for treatment. Some of it holds as large a percentage of copper as a great deal of the matte produced from other ores. What will be done with this ore in the future will be determined when the new reduction works are in operation. An immense quantity of second-grade ore—such as may be successfully operated upon at the new concentrating works—has been accumulating at the ore dumps of the Anaconda during the past two years, and that may be the rock which the new works will handle, while the high-grade ore may still go abroad. Perhaps the managers of the mine cannot themselves now say what will be the future program. The steam hoisting works of the Anaconda and St. Lawrence are probably as massive as any in the world. Although constructed at different points, they are almost twin machines. The former was made in Philadelphia, and the latter by Prescott, Scott & Co., of San Francisco. The chief owner of the Anaconda property is J. B. Haggin, of the same city. The general superintendent of mines is Marcus Daly, a practical miner who came to Butte from Nevada some years ago, arriving in town with a pack mule, and with a much smaller amount of coin than would take a jack to pack it. But by a series of subsequent operations he showed himself such a thorough master of affairs and skillful miner that he came to be placed at the practical head of this mammoth property. The purchasing agent, Mr. Prouse, and the mining foreman, Mr. Carroll, are men of a similar stamp. The depth of the Anaconda shaft is about 800 feet; that of the St. Lawrence, 600. The output of ore from the two mines can vary from 500 to 1,000 tons per day, depending on the requirements of the new works or the demand for shipment. The concentrator and smelter now being built will handle 500 tons of ore per day, being the largest works of the kind known.

The Parrot.

This mine lies just west of the Anaconda. The depth of the shaft is 350 feet, and the amount of ore daily taken out varies from 100 to 150 tons. The Parrot property includes the most complete and extensive concentrating and smelting works yet in operation in Montana. Alongside of these works another system of works, upon a principle new to the camp, is being constructed by the Butte Copper Company, which is an offshoot from the Parrot Company, and which will handle the Parrot ores. The combined works when finished will handle from 300 to 350 tons of ore per day, the capacity of the present works being 100 tons. What the new works will accomplish in the way of producing pure metal from the present ores it is as yet premature to say. They will include a large blast furnace, part of the machinery for which is already in place. The result of the present venture is watched with keen interest, and the PRESS will publish results at the earliest possible date. The skillful metallurgist of the Parrot is Dr. E. D. Peters, an old-time friend and correspondent of this paper, who is now engaged upon a work concerning the mines and mills of Butte for the forthcoming U. S. Geological Report. He has promised some future letters to the PRESS. The general superintendent of mine and smelting works is Mr. J. E. Gaylord, a gentleman of ability in administrative affairs about mines.

The Colusa.

This mine is included in the property of the Montana Copper Company, which embraces also an extensive smelter. The two are close together, and lie on the east side of the Anaconda hill, in what is known as Meaderville, a suburb of Butte. The mine is extensively opened out, with a depth in the main shaft of 560 feet. The value of the matte shipped from the smelter will aggregate some $2,000,000 per year, which shows its ore to be rich in copper. The matte is sent mostly to Europe, though it is apt to go where there is the best market for it. Mr. Mueller is superintendent of works, and the foreman of the mine is Mr. W. H. Pickering, a miner and overseer of experience and skill. Two hundred and sixty men are employed about mine and smelter, and 150 tons of ore per day are handled.

Clark's Colusa.

It adjoins the Colusa on the west. A large concentrator is now in process of erection for handling the ores of Mr. Clark's mines, which will have a capacity of 60 tons per day. W. A. Clark, Esq., the owner of these properties, is one of the leading business men of Butte, and his enterprise in establishing the new works, and thus adding to the productiveness of the camp, is much to be commended. The concentrating apparatus will be from the Fort Scott Machine Works, and they are being put in shape by Mr. H. Kemper, supervising machinist, who has put up three similar works before—one at Corbin, near Wickes, and at Glendale, in Montana, and one in Virginia City, Nevada. He evidently knows how to start such a system of works into operation.

The Lexington.

This property lies to the north of Butte City proper, in Walkerville, another suburb of Butte. This mine, and the Alice and the Moulton lie in close proximity, and make the hill resound with the noise of stamp and hoist. Like the other properties mentioned, mine and mill are combined. In this case the ores are treated by the chlorination process so familiar in California and Nevada camps. French capitalists are the chief owners of the Lexington. Their superintendent and metallurgist is Mr. Alfred Wartenweiler, who has had much experience with the ores of Butte, and who knows how to treat them with thoroughness. In 1881 the Lexington was sold to the present company by Mr. A. J. Davis, still of Butte, for $1,000,000 and a certain percentage of the stock. The present capital stock is $4,000,000. The annual product from mine and mill amounts to some $1,200,000. The Lexington is a magnificent property, its machinery being the best that was obtainable at the time of construction of works.

The Alice

Lies to the north of the Lexington. It is a mine which has been watched with interest for several years, because it was one of the first to reach a considerable depth, and to strike the water level. It now has a 60-stamp mill, besides an older mill of 20 stamps. It is one of the most productive properties in Butte. The depth of its shaft is 700 feet, with a winze to an additional 100 feet. It is well opened out on the various levels. It is one of the few mines of this locality, or the only one, whose stock is on the New York market. The annual product of the mine reaches about $1,000,000. At present most of the ore being operated upon is taken from the Magna Charta, which with the Valdimere (not at present worked) is a part of the Alice property.

The Moulton

Lies close to the Alice, joining it on the west. Mine and mill are joined by a tramway. The mill contains 40 stamps, with roasting furnaces, chlorination works and everything complete for hauling 40 tons of ore per day. The shaft in this mine is down to a depth of 500 feet. Considerable water is handled, the largest pump in the camp being operated here, but the water does not embarrass work. The Moulton is a steadily productive property, but its ore requires economical and thorough management at every step of progress, such as the superintendent, J. H. Clark, Esq., and the forsman, Mr. Patrick Clark, seem eminently fitted to enforce.

The Bell.

The Bell mine lies in the series with the Lexington, but well to the east of that mine. Its smelter is located in the valley below town, some three miles from the mine. Some of the most beautiful specimens of rock carrying native silver that we have ever seen, are to be found in the various cabinets of Butte, labeled, "From the Bell mines." We have seen samples where the dark face of the quartz was spangled as thickly as the stars stud the heavens at night. But the Bell is a mine that has seen its ups and downs. Although for a time closed down last year, it is now a productive property, doing steady work.

Thus far we have enumerated only the larger properties in Butte, which have mines conjoined with mills or concentrating and smelting works. They include the bulk of the mining property in the Summit valley district, and produce, probably, four-fifths of the ore and matte and metal that are annually treated or shipped. But there are other properties that deserve mention, some of which are quite as productive in results as a few of those already described.

The Colorado Smelter.

It lies about a mile south of the city. It employs a large number of workmen, and ships matte and metal to the value of $1,000,000 or so per year. Although it has mines of its own, it sometimes does custom work, and is, therefore, a great stimulant to the development of more modest properties than those which we have before described.

Silver Bow Mill.

This mill is located east of town, just under the brow of the Anaconda hill. It has mining properties of its own, and at present is treating ore from the La Plata and the Stevens; but it usually does some custom work during the year. It contains 20 stamps, with large roasting furnaces, and handles about 30 tons of ore per day. It will probably produce for its owners and customers half a million dollars during the year. J. A. Talbot, a man of great experience, is president and acting superintendent, and his assistant is Mr. E. J. Middleswart, who extended courtesies to our agent during his visit.

The Dexter Mill.

This is one of the older mills of Butte. It runs 15 stamps, but has no roasting furnace. It has been a custom mill for many years, and is now operated as such by several gentlemen who have it leased of W. A. Clark, Esq., whose property it is. We have heard none but good reports from the Dexter mill under its present management. Probably $200,000 as the result of the present year's work is a low estimate for the mill.

The Old Lexington Mill.

Within a stone's throw of Main street, is the oldest piece of mill property in Butte. It runs

(*Concluded on page 214*).

MECHANICAL PROGRESS.

History and Progress of Gun Making.

The manufacturing of gun metal and making it into gun barrels may be classed as one of the fine arts.

If a thorough and reliable metal is wanted for purposes independent of gun barrels, how often we hear of gun metal being used.

The past fifteen years has witnessed great changes and wonderful improvements in the manufacture of gun metal.

At one time English gun makers depended entirely upon the supply of scraps of fine iron and mild steel, such as horseshoe nails, old coach springs, clippings of saws, steel pin scraps, scraps great and small, of all kinds.

The pieces were carefully sorted and placed in a cylinder revolving slowly which polished and cleaned them by attrition one against the other.

They were then cut in small pieces of uniform size and placed in the furnace until at a white heat, then gathered in a bloom, after which, being placed under the hammer, were welded into a rough cube of iron.

This cube was rolled into bars, cut into lengths, and the number of lengths required bundled together and again brought to a white heat, then hammered into rods of 5-16 inch square, or smaller or larger as demanded by the barrel-welder for the work in hand.

At one time fine Damascus barrels were made almost entirely from old coach springs. It was found this would make very strong and fine barrels and showed a great freedom from "grays" (gray specks that disfigured the barrels, but did not impair their strength). It was thought the peculiar wear the fine metal in the coach springs had been subject to had a tendency to peculiarly fit it for gun-barrel metal.

Be this as it may, there were certainly fine tubes made from coach spring metal.

As the years rolled on the demand exceeded the supply, until at last gun metal had to be made from pig metal of the very best ores.

So far reference has been made only to the metal that goes into the make-up of fine Damascus and laminated barrels.

Cheap Guns and Fine Guns.

Inferior metal-scraps of all kinds are used for making the barrels of the cheap guns. This metal is graded and named "shamdam," "scelp," and "charcoal iron." Shamdam is the poorest; from it the cheap twist barrels are made. From scelp laminated and coarse Damascus figures are manufactured, and make a very durable pair of barrels.

Charcoal iron is made up into medium and coarse figure Damascus and laminated barrels. This metal is composed of old files and pieces of steel of the same sort. It is broken up into small cubes, then put in the furnace and worked into a bloom; the bloom is then heated and rolled into bars ready for use.

This metal makes good and desirable barrels. The use of the above-described materials has been almost entirely superseded by the more modern methods of preparing gun-barrel metal right from the pig.

The best of pig iron is obtained and placed in the furnace and reduced to a fluid state. This operation cleanses it from all dross. It is then allowed to cool, and while the temperature is going down it is gathered and worked together in blooms, and it then goes to the steam hammer, under which it assumes the shape of square blocks. It then passes through various rolls until the diameter and length of bar required are attained. The hammering has condensed the metal and eliminated many of the impurities.

The rolling has augmented its tenacity and ductility, elongating and ramifying the fibers. The mild steel to be used in connection with the fine iron is prepared in a similar manner, and is made from best Swedish pig iron, and becomes very tenacious and elastic under the heating, hammering and rolling.

In these three operations there is a constant loss of metal. The loss in puddling is about 16 per cent, and rolling from 12 to 13 per cent.

Heating, Rolling and Hammering.

The bars being now ready are cut into equal lengths and huddled together, put in the furnace, heated and welded and elongated by rolling into rods. This heating, rolling and hammering is gone through with from five to seven times in the operation of making first quality brands.

The quantity of mild steel to be used in connection with the iron has been determined on, say 55 per cent of mild steel in rods and 45 per cent of fine iron in rods five-eighths inch square. If a fine figured Damascus is wanted, four rods of iron and four of steel are laid together, first one of steel, then one of iron, then one of steel and so on until all are bundled together, making eight in all. This bundle is then brought to a white heat and the successive layers of steel and iron welded together and rolled out in a rod; the rod again heated, brought out, placed in a machine for the purpose and twisted like a rope until it has ten to fifteen turns to the inch, the number of turns determining the fineness of the figure.

This severe twisting has shortened the rod to the desired length and increased its thickness 50 per cent.

Two of these solid spine rods are now placed side by side, with the twistings running in opposite directions to each other, reheated and welded into one, and rolled into a flat rod of say 9-16 of an inch wide for the breech ends of the barrels and 11-16 of an inch wide for the muzzle ends. The barrels are made in two parts, and in the last operation of welding, called "jumping," they are brought together in the middle.

These rods of 9-16 and 11-16 inches are again heated and twisted in the form of a spiral tube; this tube is heated to a white heat, and glowing under the master hand is by a quick and deft movement "jumped" on the anvil and the open coils welded together; they are then immediately placed on a grooved rest and hammered lightly to round them up.

Joining Breech and Muzzle.

All the coils for the muzzle and breech ends of the barrel having been thus welded, the next operation is to join the breech and muzzle together. This is a very neat and artistic piece of work, but is quickly and perfectly performed, and on first-class Damascus or laminated barrels would take the eye of an expert to detect the jointure; the whole tube, from breech to muzzle, looks as if made from one coiling of rods.

The ends of the two coils are heated and joined together; a light tap on the anvil and the welding is completed.

In all these operations of heating, hammering, twisting and rolling, the iron has been in the fire seven or eight times, and under each manipulation has grown purer, stronger with increased density and ductility, resulting in the strongest, and at the same time the most elastic iron known, with one exception, and that is the Widworth fluid compressed steel, of which mention will be made further on, it coming within the scope of these articles.

The tensile strength of high-class gun metal is enormous. Experiments made in testing a variety of rods show: A rod 6-16 inch wide by 5-16 inch thick and one foot long was equal to a tension of over 11,200 pounds. This mode of proper thickness carried out in a gun barrel would sustain a strain of over 6,000 pounds to the square inch of the barrel. It is, therefore, obvious the barrel is abundantly able to sustain the pressure exerted by gunpowder gas.

The idea is generally prevalent that gun barrels of all kinds are made from one piece of of iron or steel; that is, a solid bar of metal is prepared and a hole bored through it from end to end. This is true with some of the very cheap guns made from decarbonized steel.

Damascus and Twist Barrels.

I have sought to explain that Damascus and laminated barrels are made from two or more rods of different kinds of metal; twist barrels may be made from one or more rods. When made from one rod, the rod is simply coiled and welded.

The fowling piece must be light, so as to handle quickly and not fatigue the sportsman in carrying it, and at the same time sustain its proportionate charge of powder; hence, if the barrels are light they must at the same time be strong. All of which is attained by making the metal as described.

They are also beautiful to the eye, the mild steel and fine iron being incorporated so intimately and regularly form a beautiful curled figure. The figure is but faintly perceptible in the bright metal. It is only when the barrels are finished and the browning put on that it comes fully out; the rich, dark brown color is the iron, while the lighter shade is the steel; the two blended together and running regularly look not unlike a piece of lace work. Ladies who have had their attention called to this artistic work have admired it, and wondered why they had not known it before, and concluded a fine gun was something more than a mere piece of iron and wood.

To convey an idea of the expense of making up a pair of barrels in the waste of raw material, I may add, it takes nineteen pounds of prepared metal to weld and make up into an ordinary pair of 12-gauge barrels, which, when completed with top and bottom ribs and lugs, weighs four and one-quarter to four and one-half pounds.

A fine gun can only come from skillful hands; skillful hands are paid high wages. We must therefore reason that the prices put on fine guns are not too high. The possessor of a fine gun has a thing of beauty and a joy forever.—*Pittsburg Telegraph.*

PHOSPHORIZING WIRE.—A method of phosphorizing bronze or brass wire, followed by some foreign manufacturers, is as follows: The wire is put in a solution of from one-eighth to five per cent of phosphorus in ether, bisulphide of carbon, or olive oil; five to ten per cent of sulphuric acid, and eighty-five to ninety-five per cent of water. In this bath the wire remains until the metal begins to take up the phosphorus. The wire is then drawn to one number finer, and placed in a closed retort with a thin layer of phosphorus, so that the phosphorus vapor may spread over the surface of the wire. After this the wire is packed in charcoal, which is kindled, and after proper annealing, the wire is again drawn to a finer number. This process is repeated until the required fineness is obtained. Wire so phosphorized is very tough, takes a high polish, and does not easily corrode.

SCIENTIFIC PROGRESS.

Pending Problems in Astronomy.

At the late Philadelphia meeting of the "American Association for the Advancement of Science," the retiring president, Prof. C. A. Young, the well known American astronomer, in the course of his address spoke substantially as follows upon the interesting question of "The Pending Problems in Astronomy," which he regarded as urgently demanding solution. We copy from the report of the *Scientific American:*

An impression prevails that we already know the dimensions of the earth accurately; and yet it is not so, except so far as geodetic triangulations have been possible. Astronomical determinations of latitude and longitude do not meet the case. They give only the direction of gravity, and no linear measurement. We have no means of determining exactly the relative position of places separated by oceans. Nor do we know just what sort of spheroid the earth is; for every new continental survey calls for some fresh modification. A more important question is as to the uniformity of the earth's rotation on its axis, and as to the manner and extent of its variations. Only of late have we begun to suspect our unit of time and of length. Plainly any changes in the earth's form must change the length of the day: and there is reason to suspect that the earth's rotational motion is irregular, and consequently our time reckoning is wrong and a new unit will shortly be demanded. Can a unit be found that shall be free from local considerations and equally applicable wherever physical action prevades the universe? Another problem relates to the constancy of the position of the earth's axis in the globe. Other problems relate to the rigidity of the earth, its internal constitution and temperature.

The moon also sets us problems, as to her orbital action, surface, heat, and atmosphere. The difficulties in the way are some of them purely mathematical, and progress must be slow and painful. Others are physical, and grow out of contradictory observations. In the planetary system we meet with the same problems, in the main, that relate to the moon. It is our duty to continue to search for asteroids. There are signs pointing to the existence of a great world beyoud the remotest of the present planetary family. Mercury, Mars, Venus, and Jupiter, each offers enigmas for us to explain. The red spot on the latter has disappeared after baffling us for years. The problems Saturn are still more difficult. So remote are Uranus and Neptune that it seems a hopeless task to discuss their rotation, topography, and atmospheric peculiarities. The great problem of the absolute dimensions of our system is linked with that of the solar parallax, and obscured by many obstinate errors. Solar problems of great interest yet remain open. The sun-spots are not yet explained. The peculiar rotation, equatorial acceleration, chromosphere, and prominences, etc., of the sun are receiving much attention, and this is especially true of the maintenance and duration of solar heat. Meteors and comets furnish a crowd of problems; and when we come to the stars they are multiplied to myriads, and for their solution new methods, new instruments, must aid human observations. Prof. Young closed by a eulogy of astronomy as giving the human mind its most invigorating and ennobling exercise.

Methods in Physical Astronomy.

Physical astronomy is a science which is altogether modern and for the most part contemporaneous. Its foundation was the discovery of telescopes. The telescopic harvest was so nearly exhausted by Herschel that the need of further assistance was generally felt. Arago sought help from polarization and his investigations prepared the way for spectral analysis. The small mass of matter which constitutes the chemical molecule, when it vibrates freely in the gaseous condition, sends out a special system of waves which varies with the chemical character of the molecule. The system of luminous waves may be compared to the system of sounds given by a vibrating cord, a system which depends firstly, upon the length of the cord, secondly, upon the volume, the timber and other circumstances which accompany the vibration. In the preliminary steps of spectral analysis we find the names of Wollaston, Fraunhofer, Sir John Herschel, Talbot, Miller, Wheatstone, Swanmasson and Foucault. Kerschof and Bunsen made a synthesis of all these efforts and brought the method into its present general and practical form. When spectral analysis was presented to the scientific world it held in one hand cæsium and ruhidium, in the other a list of metals recognized in a star situated at a distance which is almost inconceivable. The subsequent discovery of telluric bands and the elective absorption exercised by atmospheric vapor, prepared the way for the study of planetary atmospheres, which, when it becomes more complete, will show whether our atmosphere represents a type which is everywhere reproduced, or whether the varieties of atmospheric composition will lead us to admit the appearance and the development of life in media which are essentially different. The most recent method of physical astronomy is photographic. It has already brought a marvelous help to scientific study. The first image of a fixed star upon the daguerrean plate was that of the sun. It was obtained by Messrs. Fizeau and Foucault, the authors of the admirable methods of measuring the velocity of light, on the second of April, 1845. During the same year photographic impressions of fixed stars were obtained in the United States, and soon afterwards Rutherfurd and de la Roe produced their beautiful photographs of the moon. Rutherfurd, Gould and Draper extended stellar and nebular photography and Janssen crowned the work by his solar photographs, some of which resulted from an exposure of less than one ten-thousandth of a seconds. The photographic plates which are now prepared are not only sensitive to all the elementary rays which excite the retina, but they even extend their power into the ultra violet regions and into the opposite regions of obscure heat, in both of which the eye is equally powerless. Well, then may Janssen say, that "the photographic plate will soon be the true retina of the savants."—*Lumiere Electrique.*

The Matrix of the Diamond.

Until the South African mines were discovered, the diamond was always found in stands and gravels, different from the minerals in which it was believed to be formed. At Griqualand West, however, the consolidated eruptive mud of the mines was believed by some to be the true matrix of the diamond; but opinions differed on the question, and arguments were found on both sides. M. Chaper, a French geologist, has, however, during a scientific mission to Hindustan, succeeded in finding the diamond in its mother rock. At Naizam, near Bellary, in the Madras Presidency, M. Chaper has found the diamond in a matrix of rose pegmatite, where it is associated with corundum. The tract of country is almost denuded of trees, bare and rocky, and the rains wasting the rocks every year expose fresh diamonds in the soil. The rock is traversed by veins of feldspar and epidotiferous quartz. Here the diamond is always found associated with epidotiferous rose pegmatite. The diamond crystals observed are octahedral, but less distinct in line than the stones of South Africa, which seem to have been formed in a freer matrix. It follows from M. Chaper's discovery that diamonds may exist in all rocks arising from the destruction or erosion of pegmatite—for example, in quartzites with or without mica, clays, pudding stones, etc.—*Engineering.*

ERRICSSON'S SOLAR MOTOR.—After experiments extending over twenty years, and involving the construction of various different forms of apparatus, Erriesson has produced a solar boiler by which he obtains a pressure upon the piston of thirty-five pounds to the square inch, and a velocity of 120 turns a minute. Such a motor may he favorably employed in hot countries, like the desert of Sahara, where several of these machines are practically at work. They might also, beyond a douht, be set to work advantageously in many parts of this State, particularly in the southern and western portion of the San Joaquin valley, where they would do good service in pumping for irrigation.

STRETCHING OF THE BROOKLYN BRIDGE RAILWAY CABLE.—The strain upon the bridge cable in pulling the ears has had the result of stretching it gradually, until it was recently more than 100 feet longer than when the ears were first started. Early one morning a gang of men from the Treuton manufactory, where the cable was constructed, shortened it, under the supervision of the bridge engineer. A piece of the cable 30 feet long was cut out, and then it was respliced in time to draw the cars as usual in the morning.

THE HUDSON RIVER TUNNEL about which so much was said a few years ago, and in undertaking the construction of which upwards of $1,000,000 was expended, has long since been abandoned, and, very likely, forever. The company met with almost insurmountable difficulties from the start. The excavation that was made is full of water.

THE MOON AND THE CLOCK.—M. Poincaire contends that the attraction of the moon modifies the intensity of gravitation. Hence at the equator the clock is retarded by half a second yearly by the combined attraction of the sun and moon, and advanced a second at the poles.

THE SOAP ROOT PLANT.—According to the investigations of A. Rosoll, the saponine which is contained in the sap of the soap root plant, can he separated in form the of small, irregular white lumps, either by drying, or by treating these slices with absolute alcohol in ether.

HEAT OF THE SUN.—Mr. Erriesson has deduced from his experiments with his solar motor that the temperature of the sun cannot be less than 1,303,640° F.

Passing Events.

The Grand International Brotherhood of Locomotive Engineers is holding its annual reunion in this city this week. This is the 21st annual convention, though it has never met here before. It numbers some 16,000 men, and is a very powerful organization.

Current mining news shows nothing of a specially important nature. A few good strikes are being made in different camps, and such news as is of general interest we have summarized in the usual columns.

Dullness in business matters continues in this locality, and official inquiry is being made as to the causes, and such remedies as may be applied will be suggested. During the week the formal transfer of a certain section of the Southern Pacific road has been made to the Atlantic and Pacific.

What may be called the first rain of the season fell one day this week, though it did not continue long, and was followed by strong westerly winds.

THE two glasses for the Lick observatory have been at last successfully cast, after a delay of over two years and nineteen attempts to cast the crown glass. The crown and disk glasses will now be worked into proper shape as soon as possible by the contracting opticians, Messrs. Alvan Clark & Son, and the work on the observatory will be proceeded with excepting the building of the dome, which cannot be finished until the length of the telescope into which the glasses go has been decided upon.

Discharge of Stamp-mill Batteries.

In crushing quartz in a battery it is customary to employ screens at the front and back of the mortar of a sufficient degree of fineness to allow the material to pass through when it is pulverized to the desired fineness, the fall of the stamps throwing it outward against the screens until it will pass through. Two objections are commonly found to the operation. One is that much of the fine material is retained in the mortar after it is reduced as much as necessary, by not being thrown against the screens, and it thus remains to impede the working of the stamps; and the other is that the coarser ore is thrown against the fine screens with so much force as often to break them.

Stamp-batteries have been made in which two sets of screens have been used—one finer than the other—to separate the coarser from the finer ore after it has passed from the battery. They have also been constructed in such a manner that the ore was placed upon gratings, through which it would fall when crushed to a certain degree of fineness, and has then been elevated and passed through screens, by which the finer ore is separated from the coarser particles. Mr. George H. Malter, the well-known quartz mill builder of this city, has, however, just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improved stamp-battery, which embraces new features different from these, and by which a rapid discharge of the battery is effected.

In his invention Mr. Malter employs screens of coarse, strong wire, having meshes considerably larger than the required fineness of the material to be crushed. These are fixed in the sides of the mortar, and when the stamps fall upon the rock they crush it and throw it outward at each blow. These screens are strong enough to resist the force of the larger pieces of rock which strike them, and all which is fine enough will readily pass through their meshes, thus rapidly relieving the mortar and making it crush more rapidly.

Below the screens, and upon the sides of the mortar, are placed other screens, which lie with their surfaces upward, so that the material which passes through the other larger screens will fall upon them. They stand at such an incline that all particles which cannot pass through them will slide off and fall into a receptacle, from which they are taken by the buckets of an elevator, and are carried upward to a point from which they are again delivered to the mortar, where they will be acted upon by the stamps until reduced to a sufficient degree of fineness.

That portion of the ore falling upon these inclined screens which is fine enough passes through them, the meshes being as fine as necessary; and as the ore does not strike these with much force, they are not broken or injured. The ore passing through these screens is carried out by conveyors to the opposite side of the elevator, and is ready for the next steps in the process of reduction. That portion of the mortar below the feed opening—the fine screens and conveyor—is inclosed or cased in, to prevent the escape of dust. By this peculiar construction the rock is much more rapidly crushed, and does not pack in the mortar or clog it, and the screens will wear much longer.

Montana Mines.

No part of the United States is advancing as rapidly in mineral development as Montana. The most flourishing mining town in the whole country is Butte, where numerous reduction works are constantly beneficiating the heavy ore yield of the many producing mines. Abundant capital has been drawn in that direction by the promise of the mines, and in most instances remunerative investments have been the result. Aside from precious metals, Montana now comes next to Michigan in her copper production, and her yield is constantly increasing. Not only is the region around Butte very productive, but other sections have their rich and productive mines, which are adding to the world's wealth day by day.

We have always devoted much space in the PRESS to consideration of Montana's mineral resources, and of late have been able to obtain abundant additional information from a special correspondent, sent there for the purpose. In this number many columns are devoted to descriptions of the leading Montana mines, and we shall endeavor in the future, as in the past, to gather as much information as possible concerning them.

Copper Minerals.

Copper occurs in a variety of forms, but many minerals containing it are much too poor to allow of its profitable extraction. It is found in combination with sulphur as a sulphide or sulphuret, with oxygen as in oxide, and with carbon, hydrogen and oxygen as a hydrated carbonate. It is found also native and associated with most of the metals, common or rare. It is obtained for use mainly from native copper, cuprits, melaconite, azurite, malachete, chalcocite, chalcopyrite and tetrahedrite.

To such persons as are interested in copper mining a list of the principal copper minerals found in the United States, and their composition, will be of value for reference. There are many of them, most of them having one or more common names by which miners know them, as well as names by which mineralogists know them. We shall give the list in alphabetical order, with the scientific and common name, and the composition:

Aikinite (needle ore, acicular bismuth, cuprous bismuth). Composition—copper, bismuth, lead and sulphur.

Algodonite (arsenide of copper). Composition, copper and arsenic.

Atacamite (muriate of copper, oxy-chloride of copper). Composition—copper, chlorine, oxygen (water).

Auricbalcite (carbonate of zinc and copper). Composition—copper, zinc, carbon, oxygen (water).

Azurite (mountain blue, blue carbonate of copper, blue malachite, azure copper ore). Composition—copper, carbon, oxygen (water).

Barnhardrite (sulphide of iron.) Copper, iron and sulphur.

Bornite (purple copper ore, variegated copper ore, *ererbesite*, sulphide of copper and iron). Copper, iron and sulphur.

Bournonite (triple sulphuret of copper, lead and antimony). Copper, lead, antimony and sulphur.

Brochantite (sulphate of copper). Copper, oxygen, sulphur (water).

Caledonite (cuprous sulphato-carbonate of lead). Copper, lead, carbon, oxygen and sulphur.

Carrollite (sulphide of cobalt and copper). Copper, cobalt (nickel) and sulphur.

Chalcanthite (blue vitriol, copper vitriol, sulphate of copper). Copper, oxygen and sulphur (water).

Chalcocite (copper glance, vitreous copper, sulphuret or sulphide of copper). Copper and sulphur.

Chalcopyrite (copper pyrites, pyritous copper, sulphuret or sulphide of copper). Copper, iron and sulphur.

Chrysocolla (mountain green, mountain blue, silicate of copper.) Copper, silicon, oxygen (water).

Covellete (indigo copper, blue copper, sulphide of copper). Copper and sulphur.

Cuprite (red oxide of copper, cuprous oxide). Copper and oxygen.

Domeykite (arsenical copper, arsenide of copper). Copper and arsenic.

Enargite (sulph-arsenite of copper). Copper, arsenic and sulphur.

Harrisite (sulphide of copper). Copper and sulphur.

Malachite (mountain green, green carbonate of copper, green malachite, green copper). Copper, carbon and oxygen (water).

Melaconite (black oxide of copper, black copper, cupric oxide). Copper oxygen.

Native copper (sometimes with silver). Copper (silver).

Pseudomalachite (phosphate of copper). Copper, oxygen phosphorus (water).

Stromeyerite (sulphuret of silver and copper, silver-copper glance). Copper, silver, sulphur.

Tennantite (sulph-arsenite of copper). Copper, sulphur, arsenic (iron).

Tetrahedrite (gray copper ore, sulphide of copper and antimony, with various other sulphides). Copper, antimony, sulphur (arsenic, bismuth, silver, mercury, zinc, etc).

Torbernite (copper-uranite, phosphate of uranium and copper). Copper uranium, phosphorus oxygen (water).

Uranochalcite (oxide of uranium with oxide of copper and sulphate of lime). Copper uranium, oxygen, sulphur, calcium (water).

Vanquelinite (chromate of copper and lead). Copper, lead, chromium, oxygen.

Whitneyite (arsenidi of copper). Copper and arsenic.

Of course many of these copper minerals are not such as are worked for copper. The list, which is from the appendix of Brown's Manual of assaying, is given merely as a matter of reference, so that miners knowing the common name, may know the mineralogical name and composition of the mineral.

Taking Up Stone Lands.

It may not be generally understood that the Act of Congress of 1878, for the sale of timber lands in the States of California, Nevada, Oregon and Washington Territory, applies as well to stone. That is, any one may take up 160 acres of land, valuable chiefly for stone, on the same terms as timber lands, at a minimum price of $2.50 per acre. It does not apply to lands containing gold, silver, copper, quicksilver, coal, etc., and refers to land unfit for cultivation and chiefly valuable for timber and stone.

When any one applies to purchase a tract for the stone contained on it, under the Act referred to he must make affidavit of citizenship or intention of becoming such. He must also make a sworn statement setting forth that the land is uninhabited, is unfit for cultivation, is chiefly valuable for timber or coal, contains no mining improvements, or deposits of gold, copper, silver, coal, etc.; that it is not bought for speculation, but in good faith for use, and that he has made no agreement to dispose of it to others.

Then he must publish the required notice, and have an affidavit of the publisher of the paper in which the notice was published. Two disinterested witnesses must swear to the non-mineral character of the land. This testimony must all be taken before the Register and Receiver, and if no adverse claim is filed, the applicant will be allowed the entry and get his receipt for the purchase money. The Register or Receiver is entitled to a fee of $5, and 22½ cents per hundred words for testimony reduced by them in writing for the claimants. In case of an association of persons making application for such an entry, each of the persons must prove requisite qualifications, and each name must appear. They must also unite in the regular application for entry, which will be made in their joint names, as in other cases of joint cash entry.

Ten-Acre Tracts in Placer Locations.

Concerning placer locations the United States laws provide that legal subdivisions of 40 acres may be subdivided into ten-acre tracts. This subdivision is intended for the greater convenience of miners in segregating their claims both from one another and from intervening agricultural lands. The land office holds therefore that under a proper construction of the law these ten-acre lots in mining districts should be considered and dealt with to all intents and purposes as legal subdivisions, and that an applicant having a legal claim which conforms to one or more of these ten-acre lots, either adjoining or cornering may make entry, after the usual proceedings, without further survey or plat.

In cases of this kind, however, the notice given of the application must be very specific and accurate in description, and as the 40 acre tracts may be subdivided into ten-acre lots, either in the form of squares of 10x10 chains or of parallelograms of 5x20 chains, so long as the lines are parallel and at right angles with the lines of the public surveys, it is necessary that the notice and application state specifically what 10-acre lots are sought to be patented, in addition to the other data, required in the notice.

Where the ten-acre subdivision is in the form of a square it may be described, for instance as "S. E. ¼ of the S. W. ¼ of N. W. ¼," or, if in the form of a parallelogram, it may be described as the "W. ½ of the W. ½ of the S. W. ¼ of the N. W. ¼ (or the N. ½ of the S. ½ of the N. E. ¼ of the S. E. ¼) of section —, township —, range —, as the case may be; but in addition to this description of the land, the notice must procure the other date that is required in a mineral application, by which parties may be put on inquiry as to the premises to be patented. The proof submitted with applications for claims of this kind must show clearly its character and the extent of the improvements upon the premises.

DON'T GO TO TUSCARORA.—The *Times-Review* gives the warning. Quite a number of miners who have lately arrived are looking for places, and we would advise no more to come here at present, as the chances are they would be disappointed in their quest of work.

VANDERBILT has been obliged to sell $35,000,000 of his government bonds to bolster up his railroad stocks. He has been a heavy looser by the depreciation in these stocks.

Ore Dressing.

Mr. Wheaton B. Keenhardt, M. E., has been contributing to the School of Mines Quarterly, of Columbia College, a series of articles describing the foreign methods for the mechanical concentration of ores. These articles have been revised and corrected by the author and published in book-form by John Wiley & Son, of New York, under the title of "The Practice of Ore Dressing in Europe." The work is really a very useful one to all interested on the subject of ore concentration, as it notes the advances that have been made in ore dressing in the past few years and gives every detail necessary for a full understanding of the subject. The following paragraphs on "Cleaning" of ore are quoted from the work referred to.

The grit, sand and slime which coat the ore, and more especially the fine mine ore, as it is brought to the surface, are washed off to facilitate manual sorting and keep the work of jigging neat. The mine fines are usually cleansed while being classified into several sizes; a sharp spray of water either plays upon and passes through the sizing-screens, or, to be more effectual when revolving screens are employed, a fixed hollow pipe is used as axle of the screen, and the water issues from it directly upon the ore. Warm water from a steam condenser is of considerable advantage in the cold season, because of the hand-picking which follows sizing. The dirt derived from the washing is collected in vats and treated with other unclassified sands. The cleansing of the lump ore intended for spalling or coarse hand dressing can almost always be effected by merely playing a hose upon it; but lump ore that is to be crushed by machines is not subjected to cleansing, nor is washing found necessary after the crushing of this ore and preparatory to hand-picking.

Certain classes of ore, however, and notably zinc ores and some ores of iron, contain a quantity of stiff, clayey gangue, which frequently envelops the ore pieces, large and small, and cements them into masses of considerable size. Simple washing will not remove the clay; it becomes necessary to pass all the ore through a special cleansing apparatus—for example, through a large revolving conical drum, some 15 to 18 feet long, and 12 feet in diameter, in which the ore, besides being exposed to the vigorous action of water, is raised by upturned blades, and then falling upon other blade edges, gradually breaks loose from the clay and is cleansed. At the discharge end of the washer there is a draining screen. The cleansed ore passes over it, and then generally drops upon the sizing-grates which separate the lump from the finings.

Zinc.

It is a recognized fact that the ores of zinc in this country are equal to the best in Europe, but our methods of mining and preparing them for market are wasteful, and the methods of smelting are crude and extravagant, being very much behind European practice in technical value and economy. Of course the peculiar conditions of our ore supply, and certain general limitations to improvement imposed by the nature of the operations involved in the smelting of zinc, partly explain this, but we have much to learn yet in this industry.

In its essential features the metallurgy of zinc is the same all over the world. The metal must be distilled in fire-clay vessels, in the presence of carbon, and condensed out of the reach of oxidizing agents. The dimensions of the distilling vessels are restricted within very narrow limits by the nature of refractory materials and the thickness of the charge through which the necessary heat to effect reduction can be economically transmitted, and but little improvement is to be hoped for by a change in these dimensions.

The operations to which the ore and products must be submitted are numerous, and the repeated handling of them cannot be avoided. The recent improvements in European practice have not been the results of changes in form of furnaces or in the method of treating the ore, but have resulted from careful economies in the use of labor, fuel and ore, and have only kept pace with the concentration of mining and smelting industries into the hands of strong companies, and are in general such as can only be introduced by companies with abundant capital and where large operations are carried on. Moreover, the policy of these companies has been to regulate the output and the product, to give a steadiness of value to metal and ores, so as to render the investment of capital safe, which would otherwise have been precarious. The production of zinc in the United States is about 34,000 net tons per year.

In September the mining dividends paid here were $238,250. These included the Bonanza King Mining Co., 25c per share, $25,000; Father de Smet, 20c, $20,000; Homestake; 20c, $25,000; Idaho, $7.50, $23,250; Ontario, 50c, $75,000; Plymouth Con., 50c, $50,000; Paradise Valley, 10c, $10,000; Syndicate 10c, $10,000.

A cloudburst at Pachuca, Mexico, on the afternoon of Sept. 27th, caused a terrible inundation. The amalgamating works were destroyed and considerable silver under treatment lost. It is estimated that thirty persons were killed. A great deal of property was destroyed and many cattle drowned.

Underground Haulage.

In this country we have not paid much attention as yet to improving our systems of underground transportation of ore and water in our mines. In most places the cars are moved by hand, in others by mules or horses, and in some few instances in tunneling, small locomotives are used. The systems of wire rope haulage, so much in use in Europe have not been largely introduced here. There they use compressed air and electricity in their operations in many instances, and are constantly experimenting and improving. Steel tracks are displacing the old wooden tramway, and the endless rope, chain and compressed air have driven out the horses.

Where the mineral has to be drawn up considerable gradients on heavy roads, steam power is now in operation at many places; but even that is giving way to compressed air. On the continent, however, an electrical locomotive has lately been introduced, and it is by no means unlikely that electricity as an underground motive power will become a fact in this country, and that at no distant period. From experiments made, and from actual working, the known systems of underground haulage give the following results as to the power utilized:

Compressed air	35 to 56 per cent
Tail rope	50 to 60 "
Endless rope	75 to 90 "
Endless chain	72 to 80 "
Electric locomotives	22 to 32 "

Where engines are used for underground transport, the best kind has been found to be the horizontal direct acting double cylinder. It has also been found that where the inclination is not more than 1 in 28, the empty carriages will draw out the rope from a fixed engine without the employment of a tail rope; but where the inclination is less, the use of the tail rope will be found advantageous. By attention being paid to the underground haulage, more especially at the present time, when the depression in mining is so general, a considerable saving may be effected in the working of mines, and losses prevented, if profits are not actually made.

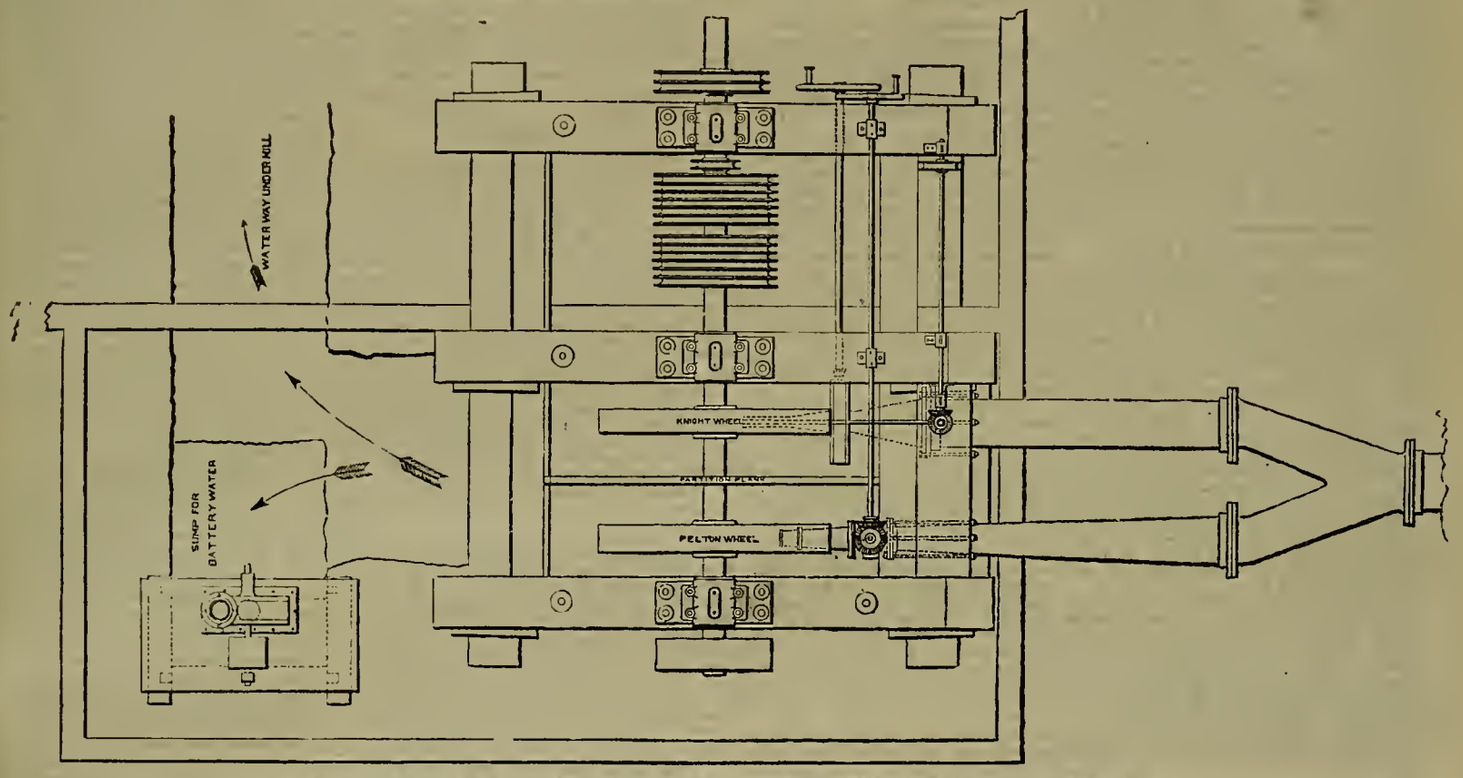
Mr. Adler, near Windsor, Sonoma county, is having an artesian well bored. At a depth of 60 feet a bed of blue clay was struck. One hundred feet in the clay a stratum of wood, 10 feet in depth was encountered, and underneath this wood, pieces of bone of a good-sized animal was brought up with the auger, a depth of 170 feet from the surface. This is on the Santa Rosa plain.

At the north end of the Comstock the next work in order is the cutting out of a station at the 3,300 level, preparatory to starting a west cross-cut. This will be work of great interest to mining men everywhere, for at that point is the deepest excavation in America.

Locomotive Engineers.

The Brotherhood of Railroad Engineers is in session in this city, at the Baldwin Theater. On Wednesday they hold their first meeting and were addressed by Mayor Bartlett, Wm. H. Barnes and others. Grand Chief Engineer, P. M. Arthur, delivered his annual address, from which we take a few extracts:

Mr. Arthur began by referring to the time when a small band of men met together in the city of Detroit, 21 years ago, for the same noble purpose which had drawn the delegates of the convention together at this time, saying that it was almost impossible to believe that so small a beginning could reach in so short a time such stupendous proportions. For the past fiscal year, which embraced only eleven months this time, owing to the journey across the continent, the reports were most favorable. The brotherhood had not been affected by the general depression of all branches of industry, but had steadily advanced. Twenty-four new divisions had been established, making a total number of 258.



PLAN OF THE WATER POWER MACHINERY IN THE ALASKA 120-STAMP MILL. (See page 209.)

The membership was never so large, numbering 16,000 men, many of whom were young. It was good for young men to be in the brotherhood. They would be useful in the future, after long training, as leaders. Here the Grand-Chief Engineer gave young men some excellent advice, pointing out the great results of perseverence, by which the very odds and ends of time might be worked up into results of the greatest value. Referring to the two divisions in Mexico, the speaker said that wherever there was a railroad there would the brotherhood be a necessity.

The great importance of the Insurance Association was dwelt upon at length, and all members of the brotherhood were advised to insure in it. "Our membership," said the Chief Engineer, "has largely increased during the year, which enables us every now and then to pay a claim from the surplus. I do not know that we could do better."

We had at the close of the last fiscal year, Sept. 30, 1883, 3,320 members. Died during the year, 42; disabled, 4; forfeited, 207; and had on August 31, 1884, 3,984, showing a net gain of 664.

"We have paid 43 claims, of $300 each, amounting in the aggregate to $126,000, making a grand total of $1,533,169 61 that we have paid to the heirs of deceased members since it was established, 16 years ago, besides disbursing $500,000 to the sick and needy, which went to cheer the hearts and homes saddened and darkened by the shadow of death."

Ten miles of the road from Los Angeles through the San Gabriel valley are now graded and ready for ties and rails.

Butte City, Montana.

(*Continued from page 210.*)

10 stamps, and is managed as a custom mill by Messrs. Donahue & Moore, two gentlemen of experience, who handle their ores thoroughly, and get good results.

The Liquidator Mine.

This mine lies close to Clark's Colusa, joining it on the northwest. It has not been suuk to a great depth—about 200 feet—hut ore is being taken out that runs high in coppers, all of which is crushed by rock-breakers fine enough to sack, and then shipped to the East or to foreign parts for reduction. A large quantity of ore now lies in the dumps of this mine which could he handled with profit by concentrating works. Mr. McDermott, one of the owners of the Liquidator, is also superintendent.

The Mountain View.

Tbis mine is well named. It lies on the summit of the hill, northeast of town. The owner, Mr. C. X. Larahie, is one of the pluckiest mine owners in Butte. He bas consistently held to the theory alluded to in this letter, that the Original, the Gagnon, the Parrot and the Anaconda are upon the same ledge as the Liquidator and the Colusa. He was formerly interested in the St. Lawrence, and believing that at the location of the Mountain View the parent ledge could also he he tapped, he sold his share of the St. Lawrence for $31,000, and at his individual expense has carried down a shaft for 638 feet, and is now drifting with the expectation of striking ore which will rival that of his neighbors on either side. He has already shipped ore that run 26.6 to 50.5 in copper, and has 1,500 tons on his dumps, of a lower grade, that assays well. Much attention is directed to the Mountain View, and all lovers of pluck and perseverance wish Mr. Larahie success even beyond present appearances.

The Original. Gagnon and Char Grit.

These three mines are in close proximity, the Original lying farthest west, then the Gagnon, and to the northwest of that the Char Grit. H. C. Kessler, a long-time friend of the PRESS, is superintendent of the latter. At present it is showiug well. The Gagnon is one of the first locations in Butte. It is told of this mine that some of its early owners had taken out some rusty-looking quartz which they deemed of little value. A. J. Davis, at that time owner of mill property in Butte, suspected its richness, and hought the rock at about $5 per ton. It yielded some 200 ounces of pure silver to the ton. Mr. Clark's eagerness to purchase the Gagnon finally hetrayed to interested parties its richness, and the mine has since been valued upon a different hasis from that of an ore-producer at $5 per ton. At present 30 to 40 tons of ore that will assay $50 to $60 per ton, are being prodnced daily.

We cannot do hetter in closing this resume of the work at most of the prominent mines at Butte, than to insert a quotation from the holiday number of the *Inter-Mountain* for 1883-4, which was a paper gotten np with great care, and a remarkaole production for any city less than a metropolis. It said: "The silver and copper production of Butte for the year 1882 was $6,200,000. During 1883 a material increase occurred, as will be seen by the following table:

Lexington	$1,289,655 34
Silver Bow Mill	367,500 00
Moulton	376,684 20
Liquidator	141,750 00
Montana Smelter	2,103,420 00
Anaconda	1,702,680 00
Dexter Mill	195,190 00
Alice	1,010,934 00
Colorado Smelter	740,000 00
Parrot Smelter	1,000,000 00
Total	$8,927,843 54

"In addition to the above products crude ore shipments from the Original, Gagnon, Lexington and other silver mines, some of which went to Colorado and some to Utah smelters, aggregate 7,000 tons, which, averaged at $70 (and that is the lowest figure that would pay for shipping) makes $490,000. The Butte placer mines produced $25,000 during the year. The Anaconda has on its dump at least 100,000 tons of ore extracted, and the Colusa has also a large extracted reserve. Ten million dollars is the lowest possible estimate which can be placed on the silver, copper, and gold product for the year 1883."

Some place the estimate as high as $13,000,000 for 1884. Should the price of copper he maintained even to its present figures, the output of this camp, after the completion of works now in process of erection, will be something enormous, and will place Butte city high in the list of metal prodncing cities of the world.

In another column is printed an article on the business affairs of Butte.

Patterson Mining District.

[From our Traveling Correspondent.]

EDITORS PRESS:—It has been about five years since prospecting began in earnest here. In the mean time many locations have been made and a very considerable amount of work performed. The claims are situated in Mono county, California, hordering on the State line of Nevada and are better known perhaps as the Sweetwater mines. They are about 40 miles distant hy stage road from Hawthorne, the present county seat of Esmeralda county Nevada, and one of the principal shipping points on the line of the Carson and Colorado Narrow Gauge Railroad.

The mineral helt is represented to he 7 miles in length by an average of 2 in width, the formation porphyry, with syenite one-half mile wide on the west.

The Summers Con. M and M Co.'s Property.

Is one of the oldest and least developed locations. It consists of a ten-stamp mill with as yet hut 5 stamps in place and four claims, to wit: the Kentuck, from which most of the ore has been derived the Georgie, the Howell and the Mayhelle. The greatest depth from surface reaches 406 feet. The ore runs from $35 to $80 per ton—battery samples—amalgamating from 75 per cent to 87 per cent. It is free silver ore, carrying a large percentage of chlorides. The quartz from the present and lowest workings has thus far averaged $68.85 per ton.

The books of the company show a total shipment to September, 1884 of $180,616, the principal portion through Wells, Fargo & Co's. office at Sweetwater. This is quite a fine showing in view of the fact that the ore has been packed four miles over steep mountain trails, saying nothing of the many other disadvantages arising from lack of capital, incident to most new mining districts.

Something of Other Locations.

Six or more tunnels are at present heing driven to gain a depth of from 100 to 200 feet; viz., on the Lady Hays lode, at the extreme south end of the mineral belt, and further north on the Nellie, Homestake, Poverty, Comstock and Star.

Tbe Poverty, Star and Nellie have reached their ore veins, finding first-class rock. The Homestake has struck her front vein, eighteen inches in width, with ore averaging $40 per ton. Her hack lode when reached is expected to be found full five feet thick, judging from surface and other indications. It is reported that 2,500 pounds from this mine yielded $234. The Poverty has ahout thirty tons on the dump ready for the mill. The Nellie, the property of Messrs. Sayers & McKnight, has from three to four feet of rich pay ore, estimated hy some to work as high as $100 to the ton. The Lady Hays is down 300 feet, has fifty tons on the dump, and is represented to give high average assays.

The Comstock has been stripped off the distance of 200 feet, showing an ore vein varying in width from four to twenty feet. The ore of this mine carries thirty-three per cent in gold, heing an exception to most mines of the district which are almost wholly silver-bearing.

Of other claims may be mentioned the John Franklin, with from three to six feet of good ore; the Lookout, the Siverado, the Mineral Chief and the Great Western. The last named has been laid hare for 500 feet in length. It is estimated that there are not less than 50,000 tons of ore in sight that will average $30 per ton, while a portion of the vein gives assays from $500 to $2,000. The Silverado has four tunnels reaching the lode at different depths. One hundred tons are said to have worked $95 per ton. Ahout 250 tons are now on the dnmp awaiting the new custom mill of five stamps, of Messrs. Kilpatrick & McCurdy, which is now ready to start up, furnished with all modern improvements and everything necessary for successful working. A. C. K.

Duncan vs. Frue.

The manufacturers of the Duncan concentrator make the following statement:

"In your issue of the 30th ult. an effort was made by the agent of the Frue concentrator to impeach the correctness of the report of the competitive test recently made hetween this machine and the Duncan at Carlisle mill in New Mexico, on the ground that the company referred to purchased the machines then used and subsequently ordered another lot. It now appears that the first machines mentioned did not give any such results as were guaranteed either in working the tailings of the Duncan or in saving amalgam. In consequence of their not having a sufficient number of Duncans to handle the pulp from the hatteries, the Frues were accepted, they heing already in place, rather than suffer the delay necessary to procure the same number of Duncans and get them ready to run. The manager bas, however, had occasion to regret this dccision as further experience has demonstrated the great superiority of the Duncan."

"The snbsequent order referred to, it also appears, was given hy the mine owners without the knowledge of or consultation with the manager of the mine. The attempt on the part of the agent of the Frue to discredit the statement of Col. James in regard to the fairness of the trial, or correctness of results, will not add to their reputation nor that of their machine. Col. James has long heen identified with the mining interest of this coast and is universally regarded as a high minded and honorahle gentleman, whose opinions and statements are not marketahle nor to be called in question."

THE agent at the Nez Perce reservation in Idaho says of the proposed return of the Nez Perce trihe to Idaho from Indian Territory: "I do not consider it advisahle to allow Chief Joseph and those who took part in the massacre to return. I think the halance could return with safety to themselves. and without causing disturbance on the part of the settlers."

The Ores of Butte City and Their Treatment.

In connection with the intelligence which we have already given our readers concerning the mineral resources of Moutana, but more especially of Butte City, we are assured that there must be a curiosity to know more ahout the peculiar character of the ores taken out and the method in wbich they are treated at the mines or works adjacent. We have found in the *Inter-Mountain* a carefully prepared article on the first hranch of this subject, which we quote helow. Following this we give a detailed description of the method in which ores are treated at the Parrot smelter, at Butte City. For the latter we are indehted to Mr. C. C. Woodhouse, formerly connected with tbe Parrot. As to tbe work nnder this latter head, it may he remarked that methods vary slightly in different smelters, hut the manner of operations at the Parrot is typical of the hest system yet adopted in Montana. The Parrot is only one of several works of the kiud in its community, though at present tbe largest in operation, its monthly production being, approximately, one million pounds of pure copper per month. The new works now heing built by the side of the former smelter will fully double the capacity of the Parrot property as a metal producer.

The Ores.

The ores of Butte are divided into three classes, according to the treatment they receive: 1st, chloridizing and milling; 2d, smelting or matting; 3d, concentrating and matting; 4th, shipping. The first is principally a free or sulphurous roasting aud milling ore assaying from $35 to $200 in silver, with an average value of $40. The second is a sulphurous copper ore sometimes carrying silver and assaying from 20 to 40 per cent copper and from $15 to $60 in silver. The third is a lower grade of copper ore assaying from 10 to 25 per cent copper. The fourth is a high-grade copper ore carrying some silver, which is shipped in a crude state to Swausea. It assays from 50 to 76 per cent copper and is mostly a copper glance, as in the case of the Anaconda. Under the reduced schedule of rates recently adopted by the Union Pacific company, it is now possihle to ship at a profit, copper ore carrying anything ahove 25 per cent. The charges to Swansea are about $33.20 per ton, which is likely to be reduced still more within a few months.

In the mines of Butte, tbe backs of the silver and copper lodes down to the water level—which varies in depth from 20 to 50 feet—are frequently much decomposed and are of true gossany character, which is the usual result of the decomposition of copper and silver ores occuring in siliceous gangue. The surface ores in the silver mines may be described as a porous quartz filled with oxidized metal generally as a chloride if silver and as a green carhonate if copper, though in some of the copper mines the surface ore has carried no copper above water, heing a low grade of silver-bearing rock.

In the copper and silver mines the copper often occurs as an oxide, but far more frequently in an amorphous form. Other metals that occur in tbe decomposed quartz are the oxides of manganese and iron, which are invalnable for fluxing purposes, the former occurring as a black variety and the latter as hlack, red and yellow ochres. The minerals reprcsenting the normal or undecomposed ores are of a sulphurous composition, and according to locality of mine may be either sulphide of copper or sulphide of copper and iron, or sulphide of silver. When the association of silver and copper occurs, the former is often found in a native state. The ores of copper are usually of the varieties known as bornite or horseflesh ore and copper glance and pyrytes varying from 30 to 76 per cent of copper. The lower grades of copper ore are also sulphuretted, but being of greater specific gravity than the foreign quartz material with which the metal is combined, it is susceptihle of easy and inexpensive concentration. Grey copper occurs but sparingly and is not in any sense a characteristic mineral.

In some mines located in the western portion of the camp, no copper occurs, the only ore being argentite or sulphide of silver in quartz. Parargarite and prousite occur in some places, hnt the sulphide is the most ordinary ore. In some cases development has shown the silver ore to he entirely replaced hy copper glance containing from 20 to 50 ounces in silver as in the Anaconda, Bell, Colusa and Parrot. Arsenic, zinc and antimony are found to some extent in all the ores of Butte, but not in sufficient quantities to cause serious trouhle in reduction. In the Colusa the percentage of arsenic varies from 1 to 2½ per cent, but is readily eliminated by the process employed at the smelter. Most of the copper and silver ores have a quartz matrix being more or less intimately associated with rhodonite, which is the silicate of manganese hetter known to the miners of Butte as "pink manganese."

Methods of Treatment at the Parrot.

The ores are brought from the mines to the company's reduction works—a distance of one mile—in small cars on a narrow-gauge railway. The high-grade ores are dumped at a place convenient to the wastiug kilns and leveled places for roast-heaps, while the low-grade ores are dumped at a place conveuient, to he started on their course through the concentrators. The high-grade ore is hroken into egg-sized pieces with 10-pound hammers, and carried hy cars to two rows of roast kilns, which are conncted hy a tunnel witb a large smokestack. The ore is placed in these kilns upon a layer of cotton wood in the hottom, a little wood being added occasionally as the kiln is being charged. When filled with ore and wood, it is covered over with finely screened ore, and the wood is fired at the bottom. Each kiln burns from four to five days, when the ore becomes sufficiently desulphurized, and is taken out. It is sometimes smoking in the center while it is being taken from the ends. Portions of the high-grade ore are taken to leveled places, where it is built into roast-heaps. This is done hy placing on the ground first a layer of wood; then a layer of ore is pitched on with strong pitchforks, which act as screens to separate the coarse from the fine. Air passages, filled with kindling-wood, are left in the heap, connecting with vertical drafts, made by binding together sticks of cordwood and piling ore about them. These air passages create a draft as the roast-heap is fired. When the heap reaches a hight of three or four feet, the fine ore lying ahout is shoveled on the top and sides to exclude the air, and the heap is fired. The wood takes fire, and readily communicates its fire to the sulphur in the pyritous ores. In the course of twelve hours the wood is nearly all consumed and the ore has settled down, hut the whole heap is burning evenly throughout, and sulphurous smoke is emitted steadily from the entire surface of the heap. These roast-heaps burn from four to six weeks, when the fire dies out, leaving the ore pretty well desulphurized and in a partially pulverized state. The iron in the ore has become well oxidized. The roasted ore from heap and kiln is then hauled to the reverberatory furnaces.

The low-grade ore passes through a process of concentration. In this work it is shoveled into a medium-sized rock-crusher, and from it goes into a coarse revolving screen, through which the finer particles pass freely into a chute, while the coarser parts pass over the screen and into a smaller rock-breaker, where they are re-crushed and afterward mingled with the finer pieces at the hottom of a helt-and-cup elevator. By this appliance the crushed ore is elevated to the upper part of the building, and discharged into a large, dry revolving screen, six feet in length. The first two-thirds of this screen is two and one-half to the linear inch; the remaining one-third, one-half mesh to the linear inch. Three separations of the ore take place here. The largest sized particles go to a set of 30-inch rolls, the next smaller to a set of 12-inch rolls, and the finest to the bottom of a short elevator, hy which it is carried to the first of a series of wet revolving screens. The coarser pieces, after heing re-crushed by the rollers mentioned, are also discharged into the wet revolving screens (each with jets of water thrown upon it from sides of longitudinal pipes), placed in the following order, according to which the sizing takes place—3½, 5, 8 and 13 mesh screens to the linear inch, and hydraulic sizing boxes follow. The screenings from the revolving screen above empty into the next below, and so on through the sizing boxes, and the slimes which are carried hy the water over the last sizing hox are settled in large tanks, afterward made into bricks, and smelted. From the various screens and sizing boxes each sized ore goes to its corresponding jig or Frue Vanner, where the ore is separated from its gangue, or sterile quartz, upon the principle of specific gravity, the light portions of the rock treated passing off with the water, while the parts heavily freighted with metal are saved. The concentrates which are saved from a very fair grade of ore are stored in hins, partially dried, and put through the calcine furnace, where 75 per cent of their suphur is oxidized and passes off as sulphurous fumes. The calcined concentrates were then taken to a place convenient to be charged in the reverberatory furnaces, where, it will he remembered, we left, in our description, the roasted high-grade ores. The charge for the reverheratory furnaces is then made up from kilu-roasted ore, heap-roasted ore, and calcined concentrates, with a few hundred pounds of raw screenings, when advisable. The slag or skum is skimmed off the molten mass within the furnaces at intervals of three or four hours, and a new charge added. The copper matte is tapped from the furnace every three or four charges. The company makes a good and steady grade of matte, assaying 65 per cent copper, which is shipped in stacks from the door of their matte house, in cars, to refineries in the East,

ENGINEERING NOTES.

Shaking Out the Curves.

The thing which stands before every railway company in the land is the adoption of stone ballast, heavier steel rails, lessened curves and more tracks, and a generally more substantial rolling stock and general equipment throughout. An exchange remarks that the Pennsylvania road is already duping this necessity. It is actively engaged in making substantial improvements on its main line and branches connecting therewith. Not only has the passenger business been very largely increased during the past few years, but the freight traffic has become almost a burden on the main stem. To accommodate this growing business it has been found necessary to shorten the distance between Philadelphia and Pittsburg. By straightening the lines, cutting curves off where possible and building new branches, much mileage has been saved.

The right of way for a fourth track has been secured on their eastern end as far as Coatesville, and the track has been laid almost to Wayne Station. Near Harrisburgh some important additions have been made to the company's facilities for handling freight. Purchases of land have been made, freight yards are being arranged, and at some places additonal tracks are being constructed. The improvement of the West Pennsylvania Division, which is intended to relieve in part the overcrowded Pittsburg Division and Pittsburg yards, by taking through traffic, is nearing completion. It involved the reduction of its maximum grade from 52 to 21 feet per mile. One of the most important pieces of work, the Salinas tunnel, is finished. It has probably the largest section of any tunnel in the world being 18 feet wide at springing line and 20½ feet above tie at center of tunnel. It is 1373.2 feet in length, two-thirds of which is on a six degree curve, the remainder on tangent. The tunnel headings, driveo from each end, met midway on the curved portion, and when the lines were produced through the aperture they struck within a half inch – practically exact.

RAILROAD BUILDINGS IN VENEZUELA. The first railroad built and operated in Venezuela began at Puerto Cabello and led to the westward. About ten miles were built and operated, but embarrassment followed, and nothing is now to be seen except a dim outline of the roadbed. About 1870, an English company built a two-foot gauge road from Tucacas to the mines of Aroa, a distance of fifty-five miles. Poisonous reptiles, wild animals, malaria and dense jungles combined to obstruct the building of the road. The largest bridge has a span of ninety feet. The ties, bridges, and even the telegraph poles are of iron. The road for its last five miles has a grade of 600 feet, requiring specially constructed engines. The freight can carry from five to six tons and the passenger cars about thirty passengers. A road from La Guira to Caracas, a distance of twenty-two miles, has been in process of construction for several years. The track of the road is three and one-half foot gauge. It is built on a series of reverse curves, having a radius of 140 feet. Surveys have been made for other lines, and a small amount of grading has been done on a road forty miles long from Puerto Cabello to Valencia.

ENGINEER ASSOCIATIONS.—The National Association of Stationary Engineers met early this month at Baltimore, in annual session. This organization is a new one, and is progressing slowly but steadily. It now has about sixty subordinate associations. This is one of the best and most useful among the many similar associations, and is one that should be encouraged by all using stationary steam power. It elevates the standing and improves the efficiency of stationary engineers and will most materially reduce the number of boiler explosions where "nobody is to blame," excepting those, who, for the sake of a petty and mistaken economy, employ cheap and inefficient engineers. The fact that a man is a member in good standing of an association of stationary engineers is a sufficient evidence of his ability to do his work economically, safely and industriously.

THE SEVERN TUNNEL is designed to give a direct line from Milford Haven, a splendid harbor on the extreme southwest point of the Welsh coast, to London. It will be about 4½ miles in length and of an average depth below the channel of 100 feet. A 7-foot tunnel has been run through the whole distance and now about 3,000 men are at work all along the line enlarging the opening to a diameter of 26 feet. It is believed that a line of steamers from the United States to Milford Haven, and thence by the Great Western railway to London will, when this tunnel is completed, make a route from this country to England much quicker than any other.

Two great engineering schemes are now attracting attention in Europe. One is a proposed railway tunnel through the Pyrenees, a convention for which has just been signed by the French and Spanish International Railway Commission. The other scheme is an international railway connecting Europe with Persia, India Burmah and China.

THE annual convention of the Locomotive Engineers of the United States and Canada will be held in B'nai Brith Hall, in this city, on the 1st of October, when it is expected that 250 delegates will put in an appearance.

USEFUL INFORMATION.

A Novel Device for Cooling Rooms.

A novel and somewhat curious apparatus is about to be placed in a German hotel for the generation and diffusion throughout the hotel of ozonized air. It will be connected with a special system of ventilation which will be properly arranged throughout the structure. The air to be ozonized is passed, by means of a fan driven by a water engine, through a chamber or generator, within which is a series of fifty glass plates fixed close together and coated with tinfoil strips so as to constitute metallic gratings, and across the interstices of these gratings the discharge of a large Ruhmkorff induction coil is passed in a multitude of little sparks. The induction coil is one of high insulation and capable of giving a spark in air between its terminals of fifteen inches. Under the system of ventilation adopted at this enterprising hotel, the ozonized air is conveyed to the large salons and the theater, and is not only warmed to the required temperature, but is charged with aqueous vapor so as to maintain the saturation corresponding to that temperature at a healthy degree of humidity. By means of suitable valves, air properly warmed and charged with aqueous vapor and ozone can be turned into any room at the rate of from 2,000 to 3,500 cubic feet per hour for each individual.

DRY-ROT IN TIMBER. A remedy has been discovered, says the *Mechanical World*, by the use of which this destructive enemy to the woodwork of a house may be destroyed or arrested. What is known as "dry-rot" is caused by the spores of a species of fungus (the *Merulius lacrymans*), which, though they are sometimes carried by currents of air to the scene of their future devastations, are more frequently present in the soil upon which the house is built at the time of erection, and are brought into near contract with the woodwork in the filling up between the joists, or sometimes even in the mortar. Notwithstanding its name, dry-rot does not act upon perfectly dry timber, but begins it ravages whenever the wood is in the necessary state of humidity. It may be prevented by mixing with the rubbish used for filling in the floors the "tank waste" from alkali works, or the same substance will completely check it if already developed. Tank waste is of no commercial value, and may be had at alkali works for fetching: it wholly destroys this species of vegetable life, and generates no bad smell whatever.

A NEW APPLICATION OF PAPER.—William J. Griffin, of the Holyoke envelope works, has invented and patented a new application of paper. It is designed as a substitute for wood in blocks or bars wherever a knife is used in a mechanical cutter. In the shape of bars, it has been put into every paper mill in town where an undercut cutter is used. The Whiting, Albion, Winona, Nonotuck, Massasoit and other mills have it. The invention is also applied to blocks for shoe cutting and cigar making. At the Holyoke envelope works it is used in the cutting blocks in the envelope cutters. One outlasts a dozen of the formerly-used wooden blocks. In its manufacture, sheets of paper are compressed by enormous force into blocks or bars, as wished, harder than wood and far more durable. Mr. Griffin has just received his patents on the invention and will now introduce them outside of Holyoke.—*Holyoke Transcript.*

WOODEN CARPETS.—What is described as a wood carpet has lately been patented by Herren Kuny & Mark of Munich, says the London *Furniture Gazette*. It consists of prepared wood fiber, felted by the aid of oxidized linseed oil and coloring matter on to a jute fabric, the back of which latter is covered with a coat of varnish. The material thus obtained is said to have a pleasing appearance, can be easily cleaned and repaired, is warm, noiseless, and can be taken up like carpets and quickly relaid on a change of residence. The surface can be produced either flat or with designs in very slight relief. The coloring is homogeneous throughout. As will be seen from the above description, the wood carpet is in some respects not unlike our linoleum. The price is said to be, however, much lower, while durability is also claimed for the new material.

STOCKINGS IN OLDEN TIMES.—Two centuries ago not one person in a thousand, probably, wore stockings; and now scarcely one person in a thousand is without them. The honor of inventing the first stocking machine belongs to William Lee, an English clergyman, who made a pair of hose by the frame, in the presence of King James I. But such was the prejudice of those times that his invention was frowned upon, and he went to France. Here he met with no better success, and died in Paris, in great poverty, of a broken heart. His machine, however, won its way, and was in general use for two and a half centuries. It is now superseded by a beautiful piece of mechanism, called the circular hosiery machine. One girl attending upon its revolutions can produce material in a single day for 240 pairs of stockings.

IRON AND ALUMINUM.—Iron is now rendered highly ornamental by coating it with aluminum, in the same way as iron plates are now tinned and converted into tin plates. This process is due to the ingenuity of Dr. Gehring, of Germany, who uses for the purpose a Bunsen burner with a blast or a muffle, and is thus able to manufacture various articles of the durable metal for daily use, the coating of aluminum giving them a silver-white luster. He also produces a gold luster, or any other color, and even an enamel coating, all of which substances are said to adhere very firmly to aluminum. The latter, as is well known, does not oxidize under normal conditions, and even stands the heat of an ordinary fire, while it is much more lustrous than tin.

PERFORATIONS IN WOOL FIBER.—Joseph M. Wade has been making some microscopic investigations in regard to wool which will be of interest to growers and purchasers of that staple. In a recent letter to *Science* he says: "In my investigations in wool fiber I have found some defective hairs that were perforated in places, evidently while growing on the sheep's back. As the perforations are perfectly circular, it would indicate that they are made by some creature at present unknown. Would it not be worth tho while of some of your scientific readers to examine into the matter, and discover, if possible, what the perforator may be, and whether it is likely to remain as little injurious as at present?"

BRONZING PLASTER OF PARIS.—A very brilliant bronzing is done with the cuttings of gold-beater's foil, ground under a muller with honey. The object to be bronzed is coated with linseed oil, and the metallic powder is applied upon it with a rag. This recipe is given in the *Oil and Colorman's Journal*, and may be used on wood, paper or pasteboard, as well as plaster. Mosaic gold may be employed for the same purpose, after having been finely ground with six parts of calcined bones. A small quantity of this mixture is taken upon a wet cloth and applied upon the object. The bronze coat is then rubbed with a dry rag, and afterwards burnished.

IMPORTANCE OF LITTLE THINGS.—A London builder was offered bricks one-eighth of an inch below the regular thickness. "What matters an eighth of an inch in a brick?" said the merchant. "It matters 3,000 more bricks for my job," was the reply. In an establishment employing 50 hands a loss of one minute each time of ringing the bell means 1.5 hours a week; this shows the value of trifles.

A BARREL OF FLOUR.—The cost of the barrel is 35 to 40 cents. It ordinarily requires from 30 to 40 pounds of coal to drive the machinery to make a barrel of flour. Four bushels and 40 pounds of wheat, or 275 pounds in all, are required to produce a barrel; or 196 pounds of good flour; bran and screenings, 69 pounds; loss not accounted for, 10 pounds.

MAN POWER.—A recent calculation shows that a man weighing 160 pounds and running a mile in six minutes performs work about equal to that of a half-horse engine; while a walker sustaining five miles an hour for a long day does work equal to that of a quarter-horse engine, and consumes only one-twentieth of the weight of food or fuel.

A SPECIES OF RICE has been discovered in Mantchuria which can be cultivated without irrigation, and consequently without risk to the health of the district. Whether it is equally productive with the common species remains an open question.

IT takes 250 bushels of potatoes to produce a ton of starch.

GOOD HEALTH.

The Fly a Dangerous Insect.

It has long been known that the common house fly sometimes acts as a carrier of infection by means of contagious matter attached to its feet and wings; but according to the *British Medical Journal* the fly also possesses a peculiar fondness for devouring the minute eggs of various worms, some of which are parasitic in the human body. These eggs they deposit in their faeces in all sorts of places, infecting our food and drink in a most reckless manner. The following is an account of some experiments which substantiate the fact:

Dr. Grass, of London, is said to have made an important and by no means pleasant discovery in regard to this matter. He exposed in his laboratory a plate containing a great number of eggs of a human parasite, and some sheets of white paper were placed in the kitchen, near the laboratory. After some hours the usual spots produced by the faeces of flies were found on the paper. These spots, when examined under the microscope, were found to contain some of the eggs of the human parasite exposed upon the plate. Some of the flies were then caught, and their intestines presented large numbers of the ova. Other similar experiments with other ova were made with corresponding results.

Dr. G. mentions an innocuous and yet conclusive experiment that everyone can try. Sprinkle a little lycopodium on sweetened water, and afterwards examine the faeces and intestines of the flies which visit it. Numerous spores will be found.

As flies are by no means particular in choosing either a place to feed or a place to defecate, often selecting meat or food for the purpose, a somewhat alarming vision of possible consequences is raised. Dr. G. invites the attention of naturalists to the subject, and hopes that some effectual means for destroying flies may be discovered.

HAY FEVER.—This is the period for hay fever, a malady from which many suffer, and which admits of few methods of relief not embodying change of altitude or climate. Dr. W. T. Phillips, of Andover, recommends belladonna –one and one-fourth minims of the succus every hour until relieved (30 m. to 3 ounces of water, teaspoonful dose). Dr. G. E. Dobbson, in the *Lancet*, has had satisfactory success by the inhalation of the vapor of camphor and steam, made to come in contact with the outer surface of the face about the nose by means of a paper cone, placed with the large end downward in a vessel containing hot water and a drachm of coarsely-powdered or shredded camphor. He asserts most positively that if this procedure is continued for 20 minutes, and repeated 3 or 4 times in as many hours, great and and usually permanent relief follows.

FOR WARTS AND TUMORS.—A painless caustic for the removal of warts and tumors may be made as follows:

Arsenous acid	1 part.
Sulphate of morphine	1 "
Calomel	8 parts.
Powdered gum arabic	48 "

This is to be sprinkled over the cuticle daily, the surface of which has been previously denuded by knife or blister.

Cauquoin's paste for the same purpose is composed of ten parts of chloride of zinc, two parts of alcohol (60°), and fifteen parts of wheat flour. The zinc in fine is added to the alcohol, then incorporated with the flour in a mortar, strongly pressing with the pestle. As soon as homogeneous it is spread with a roller into sheets an eighth of an inch thick, and after a few hours put into a well-corked bottle.

Latour's nitrochloride of zinc paste is also an excellent preparation, and is made by dissolving fifty parts of the chloride and one hundred parts of the nitrate of zinc in eighty parts of water. The solution is made by the aid of heat. When it cools, seventy-five parts of wheat flour is incorporated with one hundred parts of the solution, as with Cauquoin's paste.

ROUND SHOULDERS.—If your occupation is such as to produce bent and stooping shoulders, unless precautions are taken to correct the tendency you should make use of means for that purpose. When out-of-doors and not at the desk, straighten up, throw back the shoulders as far as possible, breathe deeply, walk rapidly, and wear, if you think necessary, braces properly adjusted. Some one suggests a mode of exercise as helpful in correcting the tendency to stoop, to wit: Hook the fingers of the hands together, and raise the elbows as high as the shoulders and pull strongly. By doing this frequently, the muscles of the shoulder-blades are strengthened, and thus serve to keep the shoulders in normal condition. Lie down on the back and raise the chest a few times, by pressure of the head against the cushion or pillow on which it is resting. This exercise will strengthen the muscles of the neck, and give it more steadiness in the erect posture.

INFECTED BY A PARROT.—Our correspondent, Mr. Henry Noble, of Turin, Italy, sends the *Herald of Health* the following peculiar item: "About a year ago, the Fueter family of Oberbalm were destroyed by a contagious breast disease, the origin of which was traced to a sick parrot. With the extinction of that family the inheritance passed to certain distant relatives of Franenfeld, and among the things which were inherited was the parrot. After the lapse of a few months four members of the Franenfeld household became ill, and the parrot died. As the cause of the infection was known, the body of the bird was sent to the Museum of Natural History at Berne for an examination. A Dr. Grimm, an assistant there, became ill shortly afterward, being struck by a serious breast complaint. All the medical force are now studying the strange case."

KILLED BY A LIGHTNING BUG.—A strange death of a little girl by accidentally swallowing a lightning bug is reported from Concord, Worcester county, Md. The child was playing in the yard with a number of other children at her parents' house, near Odell's factory, and while laughing and romping about, a lightning bug flew into her mouth and made its way down her throat. The little girl became suddenly ill, and though physicians did everything to relieve her sufferings, she died within a few hours afterward. This is the first death from such a cause on record.

SEA-BATHING.—Why, in sea-bathing, is the water warm when the wind is from the sea toward the shore? An old salt says that the answer is simple enough. When the wind is from the sea the surface water people bathe in, which is warm, is blown and held in shore; when the wind is off shore the surface water is blown out, and cold water from the depths below the surface takes its place.

DECAYED TEETH.—Professor Busch of Berlin holds that caries of teeth is peculiar to man, never having been observed in any animal. It is more prevalent among some races than others, and seems to affect the whole race. In this respect prehistoric man had no advantage,

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

QUARTZ.—Amador *Ledger*, Sept. 20: We were shown last Saturday a sample of quartz taken recently from the Iowa mine at Sutter Creek. It was small in size, weighing only a few ounces, but it was one of the richest specimens we have even seen in the county. It was literally covered with free gold. The value of such ore would run up into the thousands of dollars per ton. The seam of this rich ore, however, is very narrow, not averaging more than a couple of inches in thickness. It is free milling rock, containing no base metals worth speaking of. The Iowa is looking well in every respect, and continues to pay handsomely. The Middle Bar tunnel is in about 1400 ft.

SUTTER CREEK.—Sinkingat the Eureka has commenced in earnest. An eight-hour shift force has been put on, and the shaft is to be sunk to the depth of at least 200 ft with all possible dispatch. The shaft will be sunk by the side of the ledge, consequently no developments of any importance are looked for until sinking is completed. The usual force is working at the Lincoln. The ore pays something over expenses, and 20 stamps of the mill are kept going. At the Downs claim, north of the Lincoln, everything is progressing favorably. They have reached a depth of about 100 ft. Good rock has been encountered, which is accumulating on the dump until they have sufficient to start milling. A clean-up was made at the Iowa this month, which yielded at the rate of $85 per ton.

Inyo.

DARWIN.—Inyo *Independent*, Sept. 27: In Darwin Mr. J. C. Eddy is doing a good deal of work. Not long since after a run of 14 days with 5 stamps he cleaned up $9,000. The bullion contained gold and silver. Mr. Eddy some time since leased the Revenue mine from Robert Mitchell; he has had men steadily at work there since and now has a good deal of ore in sight. The veins run from 6 inches to 2 ft in width and is all milling ore. The best quality contains $300 per ton. Mr. Eddy says that in Snow's canyon there are thousands of tons of ore that contain not less than $20 per ton. Some weeks ago a shipment of ore was made that netted $272.50 per ton in San Francisco. In the Silver Mountain mine at Old Coso, Mr. Eddy has a number of men at work. There are now 300 tons of ore on the dump. The ore from this region was formerly hauled to mill at Olancha, but as there is plenty of timber on the ground and much ore in sight Mr. Eddy thinks seriously of putting up a mill at the mine.

HUNTER'S CANYON.—Hunter's canyon, on the east side of the range, Beveridge district, still displays the beautiful ways of the olden time. Messrs. Thomas McDonough and W. C. Kisling own and run a little 36-inch pan in Arastra ravine. The miners bring their ore in little dabs, "chiquacas," the quantities ranging from 20 pounds to a ton. The ore is worked and the bullion handed to the owner, who has in most instances sat around waiting for the completion of the operation. No ore of less value than $50 per ton will be touched by the miners, many of their "chiquacas" running away up into the hundreds of dollars per ton. This ore is all gold bearing. Messrs. McDonough and Kisling are now extending their works by putting in a new 28-ft wheel; the present wheel is but 12 ft in diameter. The new wheel will work two pans and a small battery of stamps. The miners do not tie themselves down to steady drudgery; a few days work, a few "chiquacas" of rich ore, a trip to the pan, a chunk of bullion, a trip to Lone Pine or Independence, continued until the proceeds are spent, and then back to the mine. Energetic work and modern methods would work wonders in Hunter's canyon.

CERRO GORDO.—Pat Clinton and others made a shipment of ore last week from Cerro Gordo to San Francisco. The ore will net the owners about $200 per ton. Mr. Crap, in the same locality, has a large quantity of ore ready for shipment. All of this ore is within about 8 miles of the railroad and costs $15 to ship. Four years ago ore shipped by wagon to Mohave, and thence by rail to San Francisco, cost $00 per ton. This great reduction of expense will bring into market vast bodies of ore that formerly could not be handled at all. John Thomas, an old resident of Inyo, returned from Arizona to Cerro Gordo a few months ago and resumed work on an old claim. In the Ignacio mine, one of the Cerro Gordo group, good developments have been made recently and a large amount of ore is now in sight.

KEELER.—About 20 tons of valuable ore was shipped from Keeler to San Francisco last Monday. Four gold bricks were shipped from Keeler by express last Monday. The total value of the shipment was not stated, but it will be a large sum.

BLUE BELL.—The Blue Bell is in the Inyo range, east of the Polita. The mine belongs to Peter Laird, and is one of many claims located in the same region. That whole district is only beginning to be prospected, and already there is evidence enough that it contains many valuable ledges. Mr. Laird has a lot of ore now ready for shipments to the Etna furnace. Samples of this ore give an assay value of $100 to $190 per ton. The ore must be packed two and a half miles, and hauled 10 miles to the railroad.

FREEBORN CANYON.—M. G. Nixon made a shipment of gold bullion from Freeborn canyon last Wednesday. The mine is now looking better than ever, and all concerned are well pleased with the outlook.

Mariposa.

MINING PROSPECT.—Mariposa *Gazette*, Sept. 27: Judging from what we can learn, which is from a pretty reliable source, it will be but a short time before Mr. Huling will arrive from the East to take into consideration the advancement of the mining property, known as the Yosemite Mill and group of quartz mines, which includes the No. 9,. Pool, Mt. Gaines and other valuable veins. The present indications are, Mr. Huling is endeavoring to carry out his grand mining scheme, which has been published under the head of the "Mariposa Improvement Company," by the aid of an Eastern company, and that upon his return here he will be accompanied by some parties, whose business it will be to inspect the premises and report, or to immediately push forward the work upon the basis, adopted by Mr. Huling before going East. Other similar enterprises most favorably located will move whenever the success of Mr. Huling's enterprise is once assured. The Merced river passes through the center of a vast mining region of valuable quartz veins for 30 miles or more and its great water power and mill sites all along its banks will yet become valuable and be eagerly sought after, for crushing quartz rock and milling purposes.

Mono.

STANDARD CON.—Bodie *Free Press*, Sept. 29: They extracted and shipped to the mill 506 tons of ore, also worked 750 tons of tailings. Received from the ore 825 ounces of crude bullion and from the tailings 362 ounces. Have shipped to the company this day $15,846.22, of which $10,355.42 is from two weeks' run on ore and $5,490.80 is from two weeks' run on tailings.

BODIE CON.—At the mine 190 tons of tailings were worked, the average assay value being $6 per ton. At the mine the west cross-cut, 200 level, is in 65 ft. The east cross-cut, 300 level, is in 33 ft.

MONO.—The winze below the 600 level is down 13 ft. The ore in the winze has improved both in quantity and quality. They have commenced to extend the south drift, 550 (Lent shaft) level, into Mono ground.

CLOSED.—Bodie *Free Press*, Sept. 24: The Great Sierra Consolidated Silver Company has decided to close down its works for the season and possibly forever. The tunnel site will be guarded by Redlingshaler, the mail carrier.

Placer.

MINING AT COLFAX.—*Herald*, Sept. 27: We are informed that Wm. Werry, formerly superintendent of the Rising Sun mine at Colfax, along with Geo. W. Grayson and A. Borland, of Oakland, have relocated the old Rising Sun and propose to work it in connection with the Big Tree mine, a parallel vein. The work is under the superintendency of Mr. Werry, who has taken up his quarters at the Rising Sun office. On the Big Tree they have a shaft down 50 ft and the ledge is large and shows good ore. They have commenced timbering the shaft preparatory for hoisting. They expect to take out ore enough soon to run the Rising Sun mill steadily. Quite a force of men are at work and they are making room for more, and when this new enterprise gets fully under headway the good old times experienced at Colfax during the paying days of the Rising Sun are expected to return.

Plumas.

FROM EAST BRANCH.—Plumas *National*, Sept. 20: We are indebted to Mr. F. B. Whiting for the following mining notes from the East Branch:

RICH BAR.—Messrs. Scott & McDougall are taking the necessary steps to obtain a patent to their claim on this Bar. All that seems to be needed to make this a first-class placer claim, is to introduce hydraulic power, elevator, &c.

INDIAN HILL.—The hydraulic mine being worked here by the present owners, Lazier & Co., has been successfully worked for 30 years. The present year's operations extended high up the ridge, and the character of the gold extracted establishes the fact of the close proximity of a rich quartz ledge, the gold being very coarse and accompanied with much quartz rock. This claim promises many years of successful mining. In early days it was worked by the late Dewitt Kellogg.

INDIAN BAR.—Messrs. Keep, Ballou & Carr, having stripped a large amount of ground on the lower end of this Bar, are now engaged in cleaning up the gravel next to the bed-rock.

JUNCTION BAR.—Mr. G. L. Mori has opened a very fine hydraulic claim on this Bar, and the prospects obtained warrant the conclusion that when he gets an elevator to work he will have an excellent paying mine for many years to come.

WILLOW BAR.—Judge Lott, whose line canal conducts the waters of Yellow creek to the North fork near Junction Bar, is engaged in successful hydraulic mining on Willow Bar. The elevator used there proves invaluable. In addition to this mining property, his boys have recently developed a very rich gravel deposit in the ridge back of Willow Bar, which appears to those who have examined the ground, that a good hydraulic mine will be opened there in the near future. The prospect obtained was astonishing to those who had the work in charge.

LONG BAR.—Messrs. Thomes, Gamble & Co., on this Bar, are doing good work in driving a bed-rock tunnel to cut into and drain the back channel, where it is known rich gravel has been found. This will no doubt prove a fine paying claim when the present undertaking shall have been completed. Robt. Workman also mining on this Bar, is still actively engaged in cleaning up the large area of ground hydrauliced the present season, with flattering prospects for a good season's reward.

HOPKINS CREEK.—We learn from Mr. Donahue that his quartz locations on Hopkins and Poormans creek are prospecting well, and everything looks favorable for a paying mine in the near future. He has had assays made, and the returns show 45 dollar rock, and there is plenty of it. Mr. Donahue is interested in four different quartz claims and is at work on all of them. He also informs us that Mr. D. R. Thomas has commenced a tunnel to tap a gravel bed supposed to be a break from the celebrated North American claim, near Whiskey Diggings. Mr. Plumas Turner, of the Red Slide mine, at the head of Poormans, is pushing his tunnel along as fast as possible having advertised to let a contract to run 400 ft more.

HOHAWK.—Mr. Hapgood, of Mohawk, was in town attending the convention, and reports the Hawkeye quartz mine, in which he is interested, as paying six dollars per ton by arastra process, and that he will have a Huntington improved mill ready to run in four weeks, when he expects to report some good clean-ups.

GREEN MOUNTAIN.—Greenville *Bulletin*, Sept. 27: The two blind drifts run east from No. 1 raise in the Beake chute, have been extended to the east line of the pay; 2nd, with exception of No. 2 raise, which is being pushed ahead as fast as possible between Nos. 2 and 3 drifts and between No. 3 drift and No. 5 level, all work is confined to stopes. The rock continues very hard yet, but the quality of the quartz is first class. The air drills have been taken from the No. 3 blind drift, and after a few needed repairs, were started up in the face of No. 6 tunnel on the 16th inst, and work will be continued here steadily till the sulphuret chute is reached, a distance of about 300 ft. Everything about the mill is running smoothly and well.

San Bernardino.

GOLCONDA.—Calico *Print*, Sept. 27: Last Sunday Mrs. A. K. Townsend returned from San Francisco, accompanied by Mr. G. W. Rogers, a metallurgist and mining expert. Mrs. Townsend was present at a meeting of the Directors of the company held for the purpose of considering the report of one Grant Rhodes, who recently made a few imperfect assays of low-grade ore in the Golconda mine, and who made an unfavorable verbal report before the Directors. The majority of the Directors were in favor of accepting the report of G. W. Strong, one of the Strong Bros., who have sampling works in San Francisco and are well known all over the coast for their skill and reliability in mining matters. A short time ago Mr. Strong thoroughly examined the Golconda mine, and made numerous tests of the ore in many places in and on the mine, besides taking 800 pounds of average ore, carefully sampled, to San Francisco and making a milling test of the same, extracting $54 which would be an average of $135 to the ton. The management of the mines has been given to Mrs. Townsend for the next ninety days. She will proceed to develop the property, and when sufficient ore has been taken out to guarantee the erection of a mill, it will be done near their well that is being sunk.

RICHMOND AND LOOKOUT.—In company with Jas. McGlinchy we carefully examined the Richmond mine, adjoining the Snowbird and Cuba, and were quite favorably impressed with the prospects. There has not been much work accomplished, but what has been done shows that an abundance of mineral can be taken out from the surface, and also from a considerable depth. Numerous spar seams can be traced for several hundred ft east and west, which bear mineral. These veins or seams seem to thread through a ledge of ore that extends the entire length of the claim, and can be traced through the Lookout that adjoins the Richmond on the west. Numerous prospect holes have been made along this ledge on the surface, from which ore has been taken, some pieces being covered with horn silver. There is every indication of an immense quantity of ore in this mine. The extent and richness of the same cannot, of course, be accurately ascertained until the mine is properly developed.

SAM HOUSTON NO. 3.—R. B. Johnson, the lessee and part owner of the Sam Houston No. 3, and Blackfoot, has sub-leased portions of these claims to other parties. He has given leases to three companies of chloriders on the Sam Houston No. 3. On the south side of the mine S. W. Fulton and Tom Preston have run an incline in about 25 ft, and are taking out ore of a fair grade. They have a good prospect.

BLACKFOOT.—Mr. Johnson, with a couple of men, is sinking an incline in the southeast end of the Blackfoot. They are in about 30 ft and the depth is about 30 ft. Their showing is very good, 4½ tons of ore have been milled and 2 tons are on the dump. The returns were quite satisfactory. E. Burch, Dan Wise and John Malone are working on a sub-lease in and near the old incline on the Blackfoot. They have shipped 7 tons of ore to the mill which will return about $150 to the ton in bullion. Several tons are on the dump that assay about $500 to the ton. Malone is working in a new incline, which is in about 25 ft, with ore in sight. Wise is working in the old incline and following up an ore streak quite rich in spots. Burch is working in another claim, the Josephine. Fred Heber and Peter Nichols have commenced operations on the Continental mine.

Sierra.

NEW ARASTRA.—*Mountain Messenger*, Sept. 27: S. D. & H.D. Hill are now engaged in building a new arastra on what is known as the brick yard, on the bench south of town. With this machine it is proposed to work the quartz on the Oro ledge, with which property Mr. Hill has been familiar for the past quarter of a century. The arastra will be a large one, 15 ft in diameter, and will be driven by a combined overshot and impact wheel, arranged after a manner of Mr. Hill's invention. He proposes to bring the water to his wheel, which will be 30 ft in diameter, in pipes under a head of 150 ft. Around the periphery of this wheel will be arranged suitable buckets to receive the impact of the water; the arrangement is such that after the water has exerted the force due to the head, it will fall into the buckets of the wheel, thus utilizing its weight as well as its velocity. The main object of this peculiar arrangement is to overcome a disadvantage due to a variable head of water. The water comes from Slug canyon and is owned by Mr. Hill. During part of the year there is only a small head, not enough to drive either an overshot or percussion wheel, but by combining and utilizing both the velocity and the weight of the water, he thinks he will have power enough to drive his arastra during the lowest water that will occur in any ordinary season. During times of flush water he will use his wheel simply as an overshot. He proposes to work first the ore now on the dump of the Oro mine—rock which he knows will pay for working and next, rock from the tunnel, which he has thoroughly prospected and knows the value of, having worked the upper levels years since in an arastra similar to the one he is now building. He concludes that with the power at his disposal he can work at least five tons per day. He has under consideration, also, the putting up of one of Mr. Forbes' new crushing machines, and ultimately the creation of an 8 or 10-stamp mill. Now that a start has been made, we expect to see other mills being put up at no distant day to work the ores of this section, which are almost unlimited in amount and more easily developed than in any section of the State, owing to the precipitous character of the hills in which they lie. Mr. Hill has made an arrangement with the Oro Company, a corporation, by which he secures the right to mine and work the company's rock upon advantageous terms, and for a length of time which he deems sufficient.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Sept. 27: Good headway is being made in the main north drift, now turned a few points to the west. It is passing through a selvage of quartz that lies on the east side of the ore vein. This quartz has of late considerably improved in appearance. The winze below the 2800 level is making good headway. The quartz mentioned recently as having been encountered at the bottom of the winze now appears to be passing out on the east side, and clay is making its appearance on the west. On passing through this clay it is thought that the same quartz will be found that was had above on the 2800 level.

OPHIR.—Some ore is still being extracted from the fillings of the old drifts on the 250 level. The west drift on the 500 level is being advanced at the rate of about 70 ft per week, and the south drift on the 1500 level at the rate of over 60 ft per week. On the 3200 level the joint Mexican, Sierra Nevada and Union Con. winze is down a sufficient distance below the 3300 level to make a sump. The work now in hand is the cutting out of a station, when a west cross-cut will be run on the 3300 level.

SAVAGE.—Good headway is making in the main drift on the 2800 level of the Hale and Norcross, which drift is being pushed for the Savage south line. The new tunnel which is being driven in to tap the 200 level and open the northern extension of the ore body now being worked further south in the Hale and Norcross, is in a little over 50 ft. It is in ground that works very well, and is being pushed forward as rapidly as possible.

ALPHA.—Good headway is making in the upraise from the 600 to the 500 level. It is following the large and promising body of quartz found on the 600 level. At the 500 level this body of quartz will be thoroughly explored by means of cross-cuts. The west cross-cut on the 600 level in Alpha ground is showing up quartz that gives very promising assays.

SIERRA NEVADA.—Are repairing the winze connecting the 2300 and 2400 levels.

BEST AND BELCHER.—The north lateral drift on the 825 level is now in a hard, dry porphyry. It is, however, being advanced 50 ft per week. On the 2500 level the joint Gould and Curry west cross-cut is cutting through quartz, clay and porphyry. The quartz is of fair appearance, but carries very little metal.

ALTA.—The main northeast drift on the 2150 level is making good progress and will soon reach the ore vein. The branch drift into Benton ground is being pushed as rapidly as possible, and will reach the ore vein about the same time as will the Alta drift. Not much water is now encountered.

CROWN POINT.—A considerable amount of ore is being extracted and sent to the mills on the river, and the usual prospecting work is being carried on. The mills on the Carson river are not now being run to their full capacity, owing to the low water.

COMBINATION SHAFT.—Rapid work is being done in the sinking of this shaft. It is now within 20 ft of the 3000 level. In case all shall go well and smoothly the 3000 level will be reached next Monday or Tuesday.

BELCHER.—A sufficient amount of ore is still being found to keep the mills on the Carson river at work, though, owing to a decrease in the volume of water, they cannot be run to their full capacity.

BENTON.—Good progress is being made in the branch drift from the Alta into the Benton ground. It will reach the vein in a few days. There is no trouble on account of water.

YELLOW JACKET.—The old upper levels are still yielding a considerable amount of low-grade ore, and the prospecting drifts are prospecting a favorable appearance.

UTAH.—The southeast drift on the 1750 level is still in hard porphyry, yet very good headway is being made. There is no trouble with water.

GOULD AND CURRY.—Most of the work in this mine is joint with the Best and Belcher, and the reader is referred to the report on operations in that mine.

ANDES.—Some low-grade ore is being extracted, and a good deal of prospecting is being done in deposits of quartz that are mineral-bearing.

CON. VIRGINIA AND CALIFORNIA.—The northwest drift on the 1700 level is making good headway and is in material of a very favorable appearance.

Belmont District.

BELMONT.—*Courier*, Sept. 20: Under stopes Nos. 2 and 3 have improved during the week. Upper stope No. 1 has widened at its south end to 8 ft. We are extracting more ore than the mill can handle; grade of ore constantly improving. Mill has lost three days this week for want of supplies; expecting a supply by Sunday. Shipped 2 bars Wednesday; value, $3,873.67.

Columbus District

A PROMISING PROSPECT.—*True Fissure*, Sept. 27: There are many people, directly and indirectly, interested in the welfare of this town and its nearest neighbor, Pick-handle gulch, who have been watching and waiting the expiration of the time of redemption of the Northern Belle property. The slow moving, especially so when one is waiting, cycle of time has brought around the day, and the property of the once famous Northern Belle will be known by that name no more, it having passed into the possession of the Holmes Company, the largest mining company, with its new acquisitions, that has ever existed in this district. And true to the predictions of its managers, work will again be resumed within the following two weeks. It is proposed to put 50 men at work in the mines of the company within that time and increase the number as fast as the developments warrant it. The work will not be confined to the mines alone, but the mills at Belleville will receive a complete overhauling and will be put in a perfect state of repair. The brick smoke-stack at the upper mill is to be taken down and rebuilt in a perpendicular position, besides the necessary improvements will be prosecuted at the same time. In consequence a very appreciative smile now illuminates the faces of the merchants and all others interested in the welfare of this community and its prospects for the future. It is no idle boast that

there is plenty of mineral in the Columbus mining district, a fact that has been proven in days gone by, and there is plenty of unprospected ground that there is every reason to expect good reports from when it has been opened. Not a little of this promising country is within the boundary lines of the Holmes Company, all of which can be more readily worked from the lower levels of the old Northern Belle. But with all the brightening skies for the future welfare of the camp, a rush of people here is not desirable nor commendable.

Galena District.

THE MINES. *Messenger*, Sept. 26: The Galena mines are looking splendidly, and everybody is at work and making money. B. F. Wilson will start up the White & Shiloh mine shortly. He has enough ore in sight in the Trinity mine to run the mill a year. Andy and Charley Melander have out a carload of first-class ore for shipment; their mine looks well. Blossom has several men at work on the Temby mine, which is producing good ore. Driscoll has the best showing of galena ore in the Honora O'Neal mine to be seen in the State.

Jackrabbit District.

CLOSED DOWN.—Pioche *Record*, Sept. 20: The Day mine at Royal City has been closed down for the present, and all hands discharged, owing to the low-grade of the ore. The Mendha mine at Highland continues working a full force of men, both in extracting ore and prospecting. The mine is looking fine and the allotted amount of ore is being extracted and shipped to the furnace daily.

Rebel Creek District.

OHIO MINE ORE.—*Silver State*, Sept. 26: Yesterday W. B. Todhunter's team arrived here with 24,000 pounds of ore from the Ohio mine, in Rebel Creek district. This ore is worth from $300 to $600 per ton, and it is intended for shipment to Salt Lake City.

Tuscarora District.

GRAND PRIZE.—*Times Review*, Sept. 19: South drift on the 400-ft level has been extended 22 ft during the week. Stopes are producing sufficient ore to keep the mill running.

ARGENTA.—South cross-cut in the 400 ft level is in 206 ft. Ground is beginning to get a little softer.

GRAND PRIZE.—*Times Review*, Sept. 25: South drift in the 400-ft level has been extended 20 ft during the week. Stopes are producing sufficient ore to keep the mill running.

ARGENTA.—South cross-cut in the 400-ft level has been advanced 6 ft during the week. Ground is more favorable. Considerable water is coming in in the face of cross-cut.

BELLE ISLE. North drift, 150-ft level, has been extended 7 ft; total length, 51 ft. Line upraise, 250-ft level, has been carried up 79 ft.

NAVAJO.—South drift from No. 2 cross-cut, 150-ft level, has been extended the past week 19 ft, developing a width of 1 to 3½ ft of high-grade ore. Winze in north drift from same cross-cut has been sunk 8 ft; total depth, 70 ft. No material change at this point. South drift from line cross-cut advanced 9 ft; total length, 81 ft. The vein retains its usual width and grade of ore. South drift on the 250-ft level has yielded a good quantity and grade of ore the past week. The face shows a width of 2 ft of high-grade ore; progress, 12 ft. A better grade of ore has been sent to the mill the past week. The stopes are looking well at all points.

ARIZONA.

ANOTHER RICH STRIKE.—Tombstone *Epitaph*, Sept. 27: Supt. H. T. Fisher reports a rich strike made in the Ground Hog mine last week. In running a drift from the 200-ft level, the workman struck the ledge, about a hundred feet from the main shaft, it proving to be about 7 ft thick, none of it being of lower grade than 50 ounces to the ton, and containing a streak, about 2½ ft wide, of ore running from 150 to 300 ounces. The workmen have since been engaged in mining the streak. Mr. Fisher states that with present facilities it does not pay to take out ore running less than 60 or 70 ounces. There is now on the dump fully 300 tons of ore running from 40 to 50 ounces. This ore will net about $10 per ton to the company, but the superintendent thinks he can do better with it in future than disposing of it at that rate. Next week Mr. Fisher will ship two car-loads of ore, of about 15 tons each, to Socorro or Pueblo, one car of which will run 150 and the other 300 ounces to the ton.

DULL TIMES AT QUIJOTOA.—Cor. *Sunshine and Silver*, Sept. 27: The company intend, next March, to send down an old 20-stamp mill from the Comstock. They are not yet quite sure whether what ore they have is a mining or a milling proposition, but they won't be out much on this mill anyway, as it is idle, and a trifle the worse for wear. Should they not find any more ore in the mountain, they will, as soon as they have connected the tunnels with the surface, start in to work what is on top. It is rather a come-down from our dreams of extensive reduction works and a young Virginia City to an old 20-stamp mill, but then we have discounted our disappointment and realized that a company cannot find more than is in the ground, even when they have the moral support of the Nevada bank. We want you to impress upon outsiders the fact that this camp does not depend solely on the outcome of the Ben Nevis mines. The exaggerated blowing about these mines has cast outside properties in the shade, but they are here nevertheless. The neighborhood of Covered Wells gives great promise as a good "chloriding" or poor man's camp. D. M. Hyde, an old Pinal county prospector, who has battled with fortune for eight years in this Territory, shipped ore this week from the Hattie—14 sacks through Zeckendorf and 6 sacks to Denver—which averages from $700 to $800 per ton. This is not one of the mines that incorporate for $10,000,000 and then can't raise money to get their stock certificates from the engraver. It is business, and we want a hundred more such men in this district.

COLORADO.

RUSSEL GULCH.—Idaho Springs *News*, Sept. 20: E. W. Williams and Wm. Joyce have commenced to sink a new shaft on the Badger lode, situated near the Nimrod. The top quartz prospects from 5 to 6 ounces to the cord. Sterns, Mellow & Co. on the Virginia lode, are breaking large quantities of mill ore and considerable smelting ore. The mine is looking better than ever. Mr. Andy Risar, working the Ada lode, shipped three tons of smelting ore to the Idaho Sampling works last week, which looked very fine. The mill dirt has a sprinkling of free gold in it. Scott, Rappin & Co. shipped a car-load of iron to Golden last week. The leasers of the Delaware lode have taken out the water and commenced breaking ground. Some of the ore from this mine run as high as $500 to the load.

IDAHO.

ANOTHER SMELTING ENTERPRISE.—Wood River *Times*, Sept. 23: Two gentlemen arrived by train, Sunday evening, to look into our sources of ore supply and probable future production, with the view of founding a huge smelting enterprise at or near Pocatello, at the junction of the Utah Northern and Oregon Short Line Railway. These gentlemen are mining engineers who have had many years experience in the reduction of ores, and they entertain the opinion that smelting will never pay in the Wood River region, because the ores are not sufficiently diversified. With works at Pocatello, however, this would be changed as from that point ores could be got from Montana, Idaho, Utah, and even Oregon and Colorado, and any character or grade of ore wanted could be obtained on short notice. In this way the quantity of flux used would be reduced to a minimum, and a good profitable smelting business could be conducted.

THE GALENA SMELTER.—Galena and vicinity really promises to awaken from the lethargy in which it has been plunged for three years. The smelting works have passed into the hands of a strong New York company, and Mr. McCullough is on the ground buying ores and laying in supplies, preparatory to blowing-in the furnace in the spring.

MONTANA.

AMONG THE MINES.—Butte *Miner*, Sept. 24: In going around among the mines Saturday a noticeable feature was the large amount of representation going on. To look at the number of patents issued for claims located in this district one would naturally conclude that there was nothing left for men to represent. It does not appear yet that more than a third of the claims have been patented. West of the Lexington and across Missoula gulch well up toward the top of the hill is the Golden Rule. It is now leased by a company of whom Capt. Reynolds leads the list. There is a shaft on this claim 100 ft deep. They have taken out very little ore as they have been sinking. No cross-cuts have been made and no levels been run. Saturday when the reporter was at the mine they were putting in a No. 4 Knowles pump. A small steam boist is doing the elevating for the mine. One assay was made that ran up to 173 ounces. The average assay, however, will not exceed 100 ounces.

MONO.—This is one of those prospects that are intended by providence to try a miner's faith and empty the pocket at the same time. From the surface it shows a 3 ft vein, with but little ore and that ore scattering. If there were enough of it, it would be called manganese. But there is one encouraging feature and that is the deeper the shaft goes the better it looks. The shaft is 25 ft deep now. This mine is northwest from the Moulton.

GOLDSMITH.—This lead is owned by Tong, Nichols & Roach. It has been worked by Tong, on a lease for several months. The lease has about expired and it is about to be leased again to the same party. It has been considerably prospected near the surface. There are in the lead 7 shafts varying from 35 to 100 ft deep. The principal work this summer has been done in the 56-ft shaft. It has been a profitable lease to all parties concerned. Some assays have been made that reached 150 ounces. The average has been between 50 to 60 ounces.

BELCHER.—Donahoe & Moore are working this mine on a lease. Last winter some parties had the mine bonded who worked it for a while, but did not attempt to put in proper timbers. In the spring when the frost left the ground the mine of course caved in at the shaft. The parties now working it have sunk a new vertical shaft. It has reached a depth of 32 ft.

ARGONAUT.—J. H. Glen & Co., the owners, are working this mine. There are two distinct leads in this claim. They have been sinking for some time a vertical one-compartment shaft between the leads. It has now reached 70 ft and this week the owners propose to start levels to cross-cut the leads.

GLENGARRY.—This mine, about a mile north of the Moulton, is a good piece of property. It belongs to McRae & Hughes. This claim takes in two veins. A vertical shaft 50 ft deep was sunk to work the south vein. The width of this vein varies. In some places it is 8 ft wide. The ore varies from 4 to 6 ft. At 50 ft on this vein a cross-cut was made and a level 200 ft long was run. From this level over a hundred tons of ore were taken, which returned to the owners, after paying all expenses, $60 to the ton.

RESCUE.—DeBow & Madison have about bought this mine. It has a vertical shaft 110 ft deep. A cross-cut has been made at 100 ft, showing a 5-ft vein. About 18 inches of this will assay 100 ounces. The remainder of the vein will average about 25 ounces. A contract has been let and work begun to sink the shaft 50 ft further.

ROCK ISLAND.—This mine is southeast of Walkerville, and is being worked on a lease by Voulton & Co. They are working night and day shifts. The shaft is down 130 ft. Hoisting is done by a whim. Level has been run 30 ft each way on the lead at 125 ft. The lead at that depth is 18 ft between walls. There are in the lead three veins of paying ore, each about three feet wide. In the six months this company has worked the mine, they have sold over 500 tons of high-grade ore.

RADERSBURG.—Cor. Butte *Miner*, Sept. 27: The Silver Bell is situated 7 miles west of Radersburg, in no organized mining district, but in the main range dividing Boulder and Crow Creek valleys. The ore of the Silver Bell is uniform and assays the same from either side or from any place it may be taken, very many assays have been made in Butte, Helena, Elk Horn and other places, and the very lowest shows 78 ounces in silver and 30 per cent in lead. Mr. Parker and Mr. John Nevill, after having traced the lead northwest, at once located the extension of the Silver Belt and called it the Ned lode. Messrs. Parker and Nevill began operations 10 days since on an intervening hog-back in the center of their new location. One week's work at a depth of about 14 or 16 ft has uncovered a body of ore, so far as discovered, between walls, about 7 ft in width. Three feet of this is almost solid galena, and September 11th assays give 212.90 ounces silver and 1.46 ounces gold, or a total value of $278.27 per ton. The vein is widening gradually, and steady work is going on. Very many locations have been made in this section of the country, and more are being made in every direction. Iron veins are numerous and copper is common, but of low-grade. The Silver Bell and Ned leads both carry a trace of copper and some manganese. The country is broken up, but is easy of access, with good roads running through it. The famous Elkhorn mine is but 15 miles west from the Silver Bell. With a smelter and concentrator the two mines above mentioned, properly handled, would outrival any mine in Butte or the vicinity. I have seen nearly every dump of importance in Montana, and without exaggeration can truthfully pronounce this vein one of the very richest on the Pacific or northern slope. Over 200 tons are on the dump at the Silver Bell and quite as much will be on the Ned dump in side of a week. Good roads have been graded to both mines, and a shaft house will be erected at once over the Ned, while a tunnel will be started in a few days on the lead to strike the main shaft of the Silver Bell, when it will be sunk to make connection at a depth of 250 ft. The Skinner lode is situated about two miles in a southeasterly direction from the Silver Bell lode. The vein has been opened in two different places 200 ft apart. The shaft is about 20 ft deep and an open cut on the lead produced good pay. The character of the rock is gold bearing but carries silver, galena and copper. The ore worked so far has been by arastra process and but $12.75 per ton has been saved. The Surprise lode owned by Zimmerman & Ritchart, original discovers, was found in October last. The lead has been traced for 700 yards and two shafts 25 ft each in depth, and 45 ft apart, have been sunk. Ore is being taken out from the main body. The placer diggings in the vicinity of Radersburg are about all shut down at present, as the season is over, or, in other words, water is too scarce. There are still very many pieces of valuable claims here which could be worked to profitable advantage did not the parties owning the water charge such exorbitant rates.

NEW MEXICO.

NOTES.—Silver City *Enterprise*, Sept. 13: Seven tons of concentrates from the Cooney mine arrived here for shipment on Monday last. Weekly shipments of ore and concentrates are regularly made from this important property. Work was resumed on the Black Hawk mine at Bullard's peak, on Monday. Lincoln Merrill was placed in charge as foreman and development will be pushed forward with as much vigor as heretofore. The management want from 15 to 20 first-class miners immediately. It is their intention to work about 30 men for the present. A number of men, it is understood, will go from Fleming to the Black Hawk. The Carrolton mill has been leased by Sam Green who started it up on Providencia ore last week. Other ores will be treated when the supply on hand is exhausted. Kingman, Smith, and E. H. Bonner made a 12-ton shipment of high-grade ore from the Burro and Argenta mines, at Fleming, on Wednesday. This ore was taken from the surface of the claims. The workings have not yet reached a depth of 16 ft. The ore veins have gradually widened on both claims and give promise of going down. Work is being pushed forward on both claims as rapidly as possible. The Mimbres mill is running on three-quarter time, so we are informed by the company's superintendent, Mr. Phebe, who visited this city on Monday last. Steady bullion shipments continue and the output from the mines is steadily increasing. John A. Miller returned from the Mogollons on Monday, and is making arrangements to return and start 30 men to work upon his Silver Bar mine, which is the first extension of the Cooney, and is a very valuable property. Several different points upon the claim will be worked where mineral can be extracted.

MILL.—Silver City *Enterprise*, Sept. 26: Wagner's mill, at Pinos Altos, is running 10 hours a day, and is said to be doing very satisfactory work. It is running mostly on custom work. The Old Man Co., at Fleming, is now sinking a large well in the gulch a short distance below Jackson's saloon. Should a sufficient supply of water be obtained no doubt the company will immediately commence the erection of a large mill to treat their ore. Messrs. Kingman and Smith, who have a lease on the Burro mine at Fleming have received returns from ore shipped to Billing works at Socorro, which averaged 92.55 ounces per ton. Capt. Cooney, of the Silver Hill M. Co., in the Mogollons, has purchased the engine and boiler formerly used in Kelley's saw-mill, and with this additional power he will double the capacity of his mill by adding five stamps and two Frue vanners. Development work is steadily progressing on the Cariboo mine, at Fleming. Three open cuts are being run across the vein on the surface, and a drift is being run along the vein at the bottom of the main shaft. A vein of quartz over 30 ft wide has been uncovered at the surface. The long dormant Cooney camp in the Mogollon mountains is taking on a boom. Since Capt. Cooney's magnificient success under the most discouraging circumstances, confidence has taken the place of doubts and uncertainties, and bustling activity the place of idleness. The company's mill at Pinos Altos, owing to a scarcity of water, is only running on half time, and frequently but five hours a day. The company contemplates sinking an artesian well soon, after which time, no doubt, an abundance of water will be had. It is probable that the mill will be shut down altogether in a short time, until the fall rain shall have set in. Development work on the mines, however, will be continued.

OREGON.

NOTES.—Jacksonville *Times*, Sept. 27: John W. Robinson has sold his interest in a mining claim on Evans creek to J. Tyler. Oliver Nadau of Sardine creek will put hydraulic pipe in his placer mines this season and proposes operating on a more extensive scale than ever. John Miller is getting his mines on Farmer's flat in readiness for the winter season, intending to operate on an extensive scale, if there is any water. Miners are getting ready for winter. They are not discouraged by their experience during the past few seasons and hope to have plenty water next time. Geo. H. Chick of Portland who has a quartz mill of his own invention, has rented Morse & Jacob's quartz mill near Henley, Cal., and will soon commence crushing ore. He claims to be able to work up sulphurets to perfection.

UTAH.

REVIEW. Salt Lake *Tribune*, Sept. 19: The week has been a pleasant one for weather, and the general activity has been fair. A notable local mining event is the attachment of the Frisco Con. property at Bingham by Parke, Lacey & Co. The movement of the metals has been rather above average, and the season is now at its best. The shipments of ore and bullion from this city for the week ending Sept. 13th, inclusive, were as follows: 47 cars bullion, 1,237,153 lbs.; 24 cars ore, 766,830 lbs.; 1 car white lead, 20,056 lbs. Total 72 cars, 2,024,039 lbs. The receipts of bullion and ore in this city for the week ending Sept. 17th, inclusive, were, $140,205.36 of bullion and $12,538 of ore; a total of $152,743.36. For the week previous the receipts were $136,823.36 in gross, of which $128,023.36 was bullion and $8,200 was ore. The shipments of the Horn Silver for the week were 23 cars of bullion, $69,000, bringing the shipments for the year up to the sum of $1,800,000, exactly half of which has gone in three equal quarterly dividends. The Ontario shipped for the week, 54 bars of bullion, assaying $36,029.61; carrying the total for the year up to $1,201,930.14, of which a little more than half, or $600,000, has been paid in eight monthly dividends of $75,000 each, or fifty cents per share. A syndicate of young men have leased the Durant 10-stamp mill at Bingham with privilege of buying, and are trying a new amalgamating table for the gold ores. As much of the gold as possible is of course caught in the batteries. Then the material passes on to a table six ft in diameter, set on a pivot and revolving three hundred times a minute. In the center of this table is a bowl-like depression in which 50 pounds of quicksilver is placed; the rotary motion spreads this out on all the inner surface of the bowl. Surrounding this are copper riffles, three or four inches high, between which similar riffles, set in the corner of the table, shut like teeth, leaving however, space for the material to gradually work its way outward between them. One battery has been supplied with this table and 10 tons or so run through. Assays indicate that it caught more than 70 per cent of the gold, but not enough was done to make a thorough test. The table was invented by Mr. Schuler, assayer formerly for the Old Telegraph, and for the Stewart, who has made a special study of the Bingham gold ores. Prof. Morton has obviated the difficulty at first met with in leaching his ores, on account of lime being in the ore. There remains the adjustment, so to speak, of the machinery to the ores, the draft, the fire, the feed, the proportion of salt. Little doubt is entertained of speedy success. So far as the leaching itself is concerned, Mr. Morton is well satisfied. The Crescent tramway is all laid save from the main street in Park City across to the concentrating mill. For the latter the machinery is all on the ground, and it is roofed over and is being put up. Mr. Colbath has received the first car-load of ore from the Summit, lying just north of the Cave in Bradshaw district. It is believed the Summit will soon be added to the great producing mines of Utah. Mr. Wagener has been working on the Moltke, south of Alta, off and on for twelve years, and has probably expended $25,000, mainly in adit tunnels at different levels, of which he has run more than 2,000 ft. The ore that has been found was high grade (60 lead and 145 silver) but it has not yet been found in large quantity. The lower tunnel has passed under the Discovery, where a shaft was sunk 75 ft and the workmen say it begins to look more promising. Mr. F. W. Billing has purchased and sent East 10,000 tons of Utah ores during the past year, mainly from the Eureka Hill, and the Beck & Bullion, adjoining. The ores are what are called "dry ores," carrying but little lead. They are worked in with lead ore in small quantity, and it is a relief to this market to have them sent away, because of the comparative lightness of the totality of ore lead-smelting plant. The owners get better prices for the ores. Mr. Billing thinks the ground all about Eureka Hill will be found to be full of ores. Locations have been made and the claims are being opened, and an increase of production is confidently expected in that vicinity.

THE DALY STRIKE.—Southern Utah *Times*, Sept. 13: Some weeks since a report was circulated throughout the camp that a rich strike had been made on the Daly property; in fact that a continuation of the Ontario vein had been struck. Mr. Daly now informs us that he cut the vein on a drift from the 600-ft level, and that the vein is three ft in width, but they have not yet reached the foot wall. The ore taken from the vein assays about 300 ounces on an average, and is free-milling. Mr. Daly is now busy at work putting in pumps so that he will be able soon to handle the water and he is also building ore houses so that as soon as the pumps are in working order they will begin taking out ore. The strike is, from its nature, one of the most encouraging that has ever been made in the Park, as it not only opens up a new mine, but adds to the value of one already struck—that is the Ontario—by showing that their vein runs with more or less regularity through their entire ground to the Daly property which joins them on the west. We may now hope that in the near future we will have another Ontario mine and mill in our midst, thus guaranteeing to Park City a long lease of life, and also that the dull times that have been with us for so long a time may in a great measure be done away with. This strike will also give courage to other companies that have been laying idle for a long time, not having faith or money enough to continue work.

NEW MILL.—Salt Lake *Tribune*, Sept. 16: Mr. J. W. Harker informed a reporter yesterday that he had succeeded in securing the water-power at the mouth of Cottonwood canyon; that he had purchased the mill at Camp Floyd, and proposed immediately to erect ten stamps and commence work, with the object of adding 40 more stamps in the spring. The design is, by power that costs nothing but the first plant, and by building so as to obviate any unnecessary handling of the ores, to work successfully the thousands of tons of low-grade ores in this region.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Bruntou's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Ritteuger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

JET PUMPS.

THE CHEAPEST AND BEST

STEAM PUMP for Lifts from 10 to 70 ft.

FOR IRRIGATING PURPOSES

And all General Work where a Simple Durable Pump is Required.

NO VALVES! NO PISTON!
NO OIL REQUIRED!

Can be Run by a Child.

EACH PUMP GUARANTEED.

PRICE—One-tenth of an ordinary Steam Pump, same capacity.

Call and See One in Actual Operation.

EDWARD A. RIX & CO.,
Sole Agent,
18 and 20 Fremont Street, San Francisco

HERCULES SLAYING THE GIANT.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION.

(Of the City of San Francisco.)

PREMIUMS AWARDED.

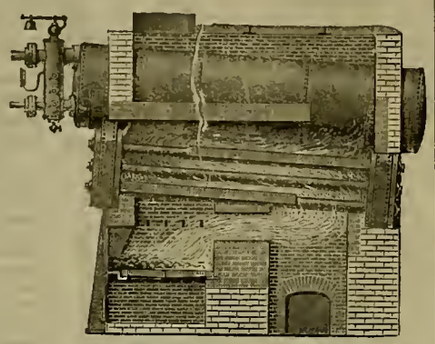
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, MO., Sept. 23, 1883

Messrs. Adolphus Meier & Co.—GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER BUSCH BREWING ASS'N.

OFFICE OF SUPT OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 24, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

Mining and Scientific Press.

LEADING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Su, erintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco

Mining Share Market.

Dullness prevails in the stock markets, with low prices. The hope of the brokers seems still to be on the Comstock where they are working away as usual in hope of finding another bonanza. For a long time, however, they have been unrewarded in their efforts, but are constantly buoyed up by a "miners hope." At the north end the next work in order is the cutting out of a station at the 3300 level, preparatory to starting a west cross-cut. This will be work of great interest to mining men everywhere, for at that point is the deepest excavation in America. At the Ophir they are pushing ahead rapidly with the drifts on the 500 and on the 1500 levels. The operations in this mine will soon become quite interesting. On the 1700 level of the California good headway is being made in the northwest drift. From this they will presently begin cross-cutting, and will probably find low-grade ore that will pay for working. At Gold Hill the Yellow Jacket, Crown Point, Belcher and Kentuck companies are extracting and shipping to mills on the Carson river about the usual quantity of low-grade ore.

Bullion Shipments.

Paradise Valley, Sept. 23, $4,134; Navajo, 24, $14,240; Silver King, 27, $19,631; Garfield, 27, $0,470; Grand Prize, 29, $6,500; Navajo, 29, $14,250; Standard, 24, $13,443; Contention, 24, $11,359; Hanauer, 23, $6,500; Nevada ore, 23, $1,680; Ontario, 23, $14,777; Horn Silver, 23, $12,000; Horn Silver, 24, $9,000; Crescent, 25, $6,500; Horn Silver, 25, $3,000; Ontario, 25, $4,790; Vienna, 25, $1,544; Day, 26, $4,250; Hanauer, 26, $5,500; Eureka ore, 26, $32,000; Horn Silver, 26, $6,000; Ontario, 26, $4,978; Stormont, 27, $3,450; Hanauer, 27, $1,750; Horn Silver, 27, $6,000; Ontario, 27, $6,552; Vienna, 27, $3,123; Christy, 27, $1,706; Hanauer, 28, $3,550; Crescent, 28, $4,100; Horn Silver, 28, $6,000; Ontario, 28, $5,905. The banks of Salt Lake City report the receipt for the week ending September 24th, inclusive, of $118,241.99 in bullion and $14,290 in ore; a total of $132,521.99.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superviser Court, Department 10, San Francisco:

DEL MONTE MILLING CO., Sept. 29. Objects, to manufacture flour and buy and sell grain. Capital stock $100,000, Trustees—Thomas J. Parsons of Oakland, Frederick Merkfessel of Sacramento, George D. Metcalf of Oakland, Victor H. Metcalf of Oakland, and John D. Gage of San Francisco.

UNDERGROUND CONDUIT AND ELECTRIC TELEGRAPH AND TELEPHONE CO., Sept. 29. Object, the manufacture and conducting of telegraph, telephone and electric light wires, and using the same either underground or overhead, or both, to manufacture electric machines, to purchase and control patents, etc. Directors, P. H. Blake, J. L. Armstrong, A. F. McGrew, John B. Anstin and M. Lebatard. Capital stock, $1,000,000.

SOUTH SAN FRANCISCO CABLE ROAD, Sept. 30. Capital Stock, $500,000. Directors—Thomas Harney, Thomas Brown, William Spreen, Timothy A. Nunan and John White. The company has obtained a franchise for a road and branches, from Third street on Harrison to Seventh, and along Seventh northerly to Market street; also from Harrison street, southerly on Seventh to and along Pennsylvania avenue, Tulare street, across Islais creek bridge, to and along R or Potomac street, Islais street, Twentieth street, Silver avenue to San Bruno road.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento Co.
A. C. KNOX—Nevada (state).
B. W. CROWELL—Fresno and Tulare counties.
GEO. MCDOWELL—Plumas and Sierra counties.
WM. PASCOE—San Francisco.
WM. H. COOK—Los Angeles Co.
H. G. PARSONS—Idaho and Montana.
G. W. INGALLS—Arizona.
H. A. BEATON—Washington Ty.
L. L. WOODMANSEE—Oregon.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the canse it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

THE taxable property in Sonoma county foots up to $24,812,111. The county ranks seventh

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING SEPTEMBER 23, 1884.

305,565.—REVOLVING CYLINDER ENGINE—J. J. Blair, Tacoma, W. T.

305,575.—WATER MOTOR—Jas. H. Culver, S. F.

305,446.—LOOM SHUTTLE—H. P. Garland, San Quentin, Cal.

305,523.—LIQUID COOLER AND WATER FILTER—D. H. Logan, S. F.

305,608.—LUBRICATOR—August Lotz, San Jose.

305,698.—VELOCIPEDE—R. B. Lunsford, Oakland, Cal.

305,610.—DEVICE FOR TURNING VEHICLES OUT OF CAR TRACKS—T. H. Macdonald, S. F.

305,612.—PEN BRUSH—Geo. Maderia, Santa Cruz.

305,790.—GRINDING PAN—Geo. H. Malter, S. F.

305,701.—STAMP BATTERY—Geo. H. Malter, S. F.

305,537.—FOLDING SKELETON GUN STOCK—Fred. Schwatka, Vancouver Barracks, W. T.

305,718.—CUT-OFF VALVE—J. P. Simmons, S. F.

305,556.—SAW HORSE—Richard Wylie, Napa.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GRAIN SEPARATOR.—Alexander W. Lockhart, Stockton. No. 305,203. Dated Sept. 16, 1880. This apparatus is for separating thrashed grain from the straw, making the usual preliminary or ordinary cleaning of the grain, and also the recleaning, by which the grain is prepared for market in a single continuous operation. The patent covers a number of details of operation and construction.

SIDE-SPRING VEHICLE.—Z. M. Howell, Salida, Stanislaus Co. No. 305,193. Dated Sept. 16, 1884. The patent covers a new arrangement and connection of side bars or rails and body-supporting springs. The object of the invention is to provide a simple frame for the attachment of the spring, and such an arrangement and connection of the spring therewith, that, whether in a four or a two-wheeled vehicle, they may possess that independence of movement which will enable them to remain unaffected by the unpleasant movement of the vehicle frame derived from the jerking and jogging of the horse.

CUT-OFF VALVE.—Jno. P. Simmons, S. F., assignor of one-half to Wm. H. Ohmen. No. 305,718. Dated Sept. 23, 1884. This invention relates to certain improvements in engine valves, and it consists of a novel combination of a conically-shaped valve oscillating or partially rotating within a similarly-shaped valve chamber, and steam chest, and an interior concentrically placed cut-off valve, also rotating so as to limit the admission of steam.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufacture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.
2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough oil to prove what we say. Our oil has now been adopted as

Cheaper, More Economical, and More Serviceable than any other Oil

On the Central and Southern Pacific Railroads, the Northern Pacific, South Pacific Coast, and North Pacific Coast Railroads, the Oregon Railway and Navigation Co., Pacific Coast Steamship Co., and all the prominent Iron Works, Saw-mills, etc., on the Coast and Puget Sound. ADDRESS:

Business at Butte City, Montana.

Our correspondent at Butte sends us the following notes concerning the business houses at Butte, Montana.

The spirit in business at Butte is that of wide-awake, enterprising men, keen to avail themselves of the best the market offords, and not inclined to follow in grooves and ruts. Their predictions have been to buy at wholesale in San Francisco, or on the Pacific coast; but the shrewd dealers and manufacturers of the East are supplanting by slow degrees the Pacific coast traders. We of California must be alert and sharp to hold a portion of the immense prospective trade of Montana. The railroads here favor freight from the East, which is large odds to contend against; but in the matter of heavy machinery this difference is said to be small compared to the advantage in first cost at Eastern foundries. The machinery for the three large concentrating and smelting works now in process of erection came almost entirely from the East.

The buildings now being erected in Butte, and the improvements of mine owners, show that there is a feeling of confidence in the permanence of the mining industry. This feeling cannot but be shared by the observant visitor, as he sees evidence of great ore bodies in mines already developed and prospects of equally great things in the undeveloped mines that are so thickly scattered through the town.

Some of the most successfully operated machinery of this district and of Montana is that placed by E. D. Reynolds, Esq., who is one of the well informed gentlemen of Butte to whom our agent is indebted for much information and many courtesies. He represents the Fort Scott Machine Works, which have placed large plants in many parts of the Territory; also Griffith & Wedge, Zanesville, Ohio, and other manufacturers of mining and milling machinery.

Some of the Leading Business Houses of Butte City.

There is, perhaps, no more conspicuous success in the mercantile field to be met with anywhere throughout this great region of Territories than that of Sands & Boyce, of Butte City. The firm is composed of Mr. A. Sands, Denver, Col., Mr. J. Sands, the resident New York buyer, and Mr. J. R. Boyce, Jr., who is the resident and managing partner, and to whose energy and zeal the unparalleled success of the firm is largely due. Dry goods, ladies' seal and other wraps, dresses, notions, carpets, wall paper, ready-made clothing, gents' furnishing goods, etc., are the principal lines of goods in which the firm deals, and its business, which is both wholesale and retail, extends throughout Montana and the adjoining Territories. Their place of business occupies one of the most eligible sites in the city of Butte, and their extensive salesrooms are said to contain more square feet than those of any similar business in the Northwest. They are lighted by electricity, and are modern in every particular.

Gans & Klein, wholesale and retail dealers in clothing, gents' furnishing goods, boots, shoes, hats, caps, trunks, valises, etc., are the most extensive dealers in these lines that there are in Montana. The parent house is at Helena, and branches are maintained both at Butte City and at Benton, both of which branches carry as extensive stocks as do any houses in the city where they are located.

Among the solid business houses of Butte, that of E. L. Bonner & Co. stands pre-eminent. They have the finest store in the Territory, and lead all competitors in the magnitude of their business. They carry the largest and finest stock of dry goods, carpets, wall paper, ladies' suits and wraps, clothing, hats, boots and shoes, blankets and rubber goods to be found in the city. By treating all persons alike, by adhering strictly to one price, and making that price the lowest, they have gained the confidence of the public and built up the largest business in their line in the Territory. They not only do the largest retail business, but have also a heavy jobbing trade, shipping goods to nearly all parts of the Territory and into Idaho.

Besides these firms there are the following:

DONNELL, CLARK & LARABIE, bankers.

JOHN CAPLICE & CO., wholesale and retail dealers in groceries, boots, shoes, furnishing goods, etc., Main street.

E. W. WYNNE & CO., dealers in drugs, medicines, paints, oils, stationary and fancy goods, Main street.

LEVSON & TURCK, jewelers, carrying one of the most extensive stocks in the Territory, Main street.

J. KAHNWEILER, dealer in ladies' and childrens' furnishing goods, Main street.

A. COHEN, wholesale and retail dealer in groceries, provisions and produce, Main street.

ALTIEZ & BOHLER, manufacturing jewelers, and dealers in watches, clocks, and jewelry, Main street.

S. LOUIS, dealer in general household goods, guns, pistols, cigars, etc., Main street.

GEO. F. MARSH, general insurance broker, Main street.

OWSLEY & COWAN, proprietors of livery stables, Butte transfer line, Main street.

L. R. MAILLET & CO., wholesale and retail grocers, dealers in wines, liquors, tobacco and cigars, Main street.

WHITING & ALEXANDER, dealers in vegetables, family groceries, etc., West Park street.

C. NISSLER, proprietor Silver Bow brewery.

JOHN O'ROURKE, wholesale and retail dealer in wines, liquors and cigars, Main street.

HIGHT & FAIRFIELD, jewelers, 317 Main street.

R. PETTIT, dealer in furniture and upholstery, also undertaker, Broadway and Main streets.

C. E. FOWLER, gunmaker, and dealer in guns and ammunition, 40 West Park street.

A. SPECKART, wholesale liquor dealer and manufacturer of soda water, ginger ale, etc., Main street.

E. L. MAHONEY, manufacturer of boilers, sheet iron work, etc., East Park street. Repairing done.

CENTENNIAL HOTEL, corner Granite and Main streets, most centrally located hotel in town, Dr. G. W. Beal, proprietor.

METROPOLITAN RESTAURANT, 14 West Park street, Lachman & Demstan, proprietors. Oysters a specialty.

J. D. THOMAS, wholesale and retail dealer in groceries, produce, etc., West Park street.

J. C. SINGER, furniture and upholstery, West Park street.

BARRET & JACKY, dealers in harness and saddlery, West Park street.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.
No. 252 Market St. Elevator, 12 Front St., S. F. Telephone No. 658.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

WONDERFUL DEVELOPMENTS IN OPTICAL SCIENCE.—All complicated cases of defective vision most carefully tested after the most progressive method known to opthalmology, and, if any morbid changes are indicated, I will be only too happy to recommend the best opthalmic surgeon on the coast in time; especially in young children, where progressive myopia is manifested, and thereby induce parents to seek the advice of an oculist. It is a well known fact that the majority of near-sighted persons, especially if suited by a patent process, rest in fancied security, when their cases really need the attention of a pathologist. Near-sighted eyes are looked upon as unsound, with but few exceptions. All errors of refraction corrected with suitable glasses, applicable to myopia, hypermotropia, simple, compound and mixed cases of astigmatism. My lenses are made by the most skillful workmen of Paris, to order. Being constantly occupied in testing defective eyes, I have no disposition to lose valuable time in doing automatic labor at grinding lenses.

C. MULLER, Optician,
5 135 Moutgomery St., near Bush, S. F.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this offices at pub'shed rates.

Chicago Prices Beaten!

Inventor and manufacturer of the Celebrated Slot Cut and Slot Punched Screens. Mining Screens a Specialty, from No. 1 to 15 (line).

☞Orders Promptly Executed.

JENKINS PATENT VALVES.
Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

A Great Triumph!
WON BY THE MANUFACTURERS OF THE
EUREKA CEMENT,
GOULD & HILL, Proprietors,
103 and 105 Fremont St., San Francisco.

On the 25th day of August, 1884, Judge Sahin, of the United States Court of Equity, decided the great infringement case of the Salamanda Felting Company of New York and Philadelphia vs. the EUREKA CEMENT, in favor of the EUREKA CEMENT. This decision is one of the most important that has been rendered for many years, because it gives Messrs. GOULD & HILL the unrestrained right to continue the manufacture of the BEST COVERING FOR STEAM BOILERS AND PIPES that is known to the world.

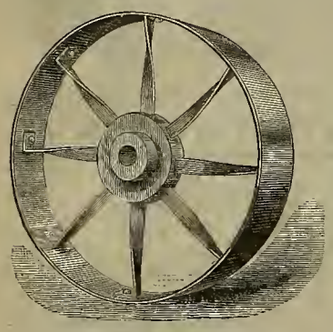
STOCKHOLDERS' MEETING.

Notice is hereby given that a meeting of the Stockholders of Fremont Mining and Milling Company will be held at the Company's office, No. 402 Front Street, Room 8, San Francisco, California, on Tuesday, October 7, 1884, at 12 o'clock M., for the purpose of electing officers for the Company, and of acting upon a proposed amendment of the By-Laws of the Company, providing that vacancies in the offices of President, Vice-President, and Trustees shall be filled by the Board of Trustees.

MARK T. ASHBY, Secretary.

Iron and Machine Works.

MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
(Signed:) RICHARD T. MARSH,
Managing Director.

316 California St., San Francisco.

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE
Cheapest and Most Effective Machine
OF THE KIND NOW IN USE.
Adapted to All Grades and Classes of Ores

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coaser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

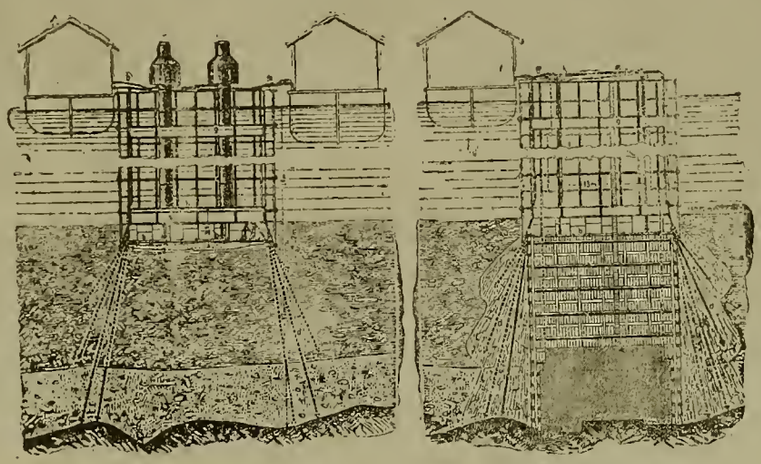
SAN FRANCISCO, SATURDAY, OCTOBER 11, 1884.

VOLUME XLIX. Number 15.

New System of Obtaining Pier Foundation.

In the MINING AND SCIENTIFIC PRESS of Aug. 23d, we gave a description of the Poetsch system of shaft sinking by freezing. This system has successfully been applied in mining operations, and the inventor has now a contract to apply it in sinking a series of bridge piers near Bucharest, Austria.

This last contract will be watched with especial interest, as the inventor claims, and seemingly with justice, that this freezing plan opens up possibilities, in founding bridge piers before undermined of. As opposed to the compressed air process, the main advantages are in the practical want of limitation in depth, and the relief of the laborers from the effect of the severe atmospheric pressure. We are indebted to the *Techniker* for the accompanying cuts illustrating the application of this process to the founding of bridge piers. Two cases are given; the first combines the Poetsch method with the pneumatic process, but in this case after the working chamber has been sunk to and into the river-bed, the congealing tubes are applied and the entire mass between the caisson and the rock frozen solid. As the caisson will then be practically sealed against the entrance of water, the air-lock can be removed and the masonry built up as in the open air. In the second case, compressed air is entirely dispensed with; an open caisson being sunk over the site of the pier and the freezing tubes put down through the water; when the congelation is completed the caisson can be pumped out and the work done in the open air.



APPLICATION OF THE PŒTSCH SYSTEM TO PIER FOUNDATION.

Neither of the above methods have yet been practically tested, but as before mentioned the attempt is about to be made at Bucharest. Its application to any special case would be controlled by the local circumstances; such as depth of water, thickness and character of the mud or sand deposit, and the currents and temperature of the water. In laying the masonry, precautions would also have to be taken to counteract the effect of the extreme cold upon the stone and the cement; Mr. Poetsch believes that the interposition of straw, cotton, refuse or other nonconducting material between the masonry and the ice-wall would accomplish this; and for a cementing material, a composition of tar, pitch or asphaltum and sand could be used, as these are not affected by frost.

The sinking of the pipes is done by aid of the water-jet. In the case of the *Centrum* mine, the large pipes were sunk with open ends, and afterward closed by a leaden plug and alternating layers of cement and asphaltum, with iron washers between, to prevent the escape of the congealing liquid. This method was found to be expensive and wasteful of time, and in the later work three pipes are used, the outer one merely to secure an opening into which can be sunk the two circulating pipes; in this case the bottom of the large pipe is closed by welding it together before putting in position. The entire plant can be used on any number of different works, as the pipes can be recovered as soon as the ground surrounding the shaft thaws out. The cost of sinking by this method is in proportion to the depth, and the time consumed in freezing is in similar ratio. The plant costs, in Germany, about $30,000.

Notwithstanding the unfavorable conditions, the first application of the Poetsch method was perfectly successful, as attested, not only by the Director, of the Archibald Mine, but also by many engineers who visited the works.

In new works undertaken by the inventor, he commences by filling the shaft to the water level with gravel, in case previous sinking has brought the work below that level. The method of putting in place the freezing pipes varies with the location. When the fluid soil has a slight thickness only, and the shaft is already sunk to the water level, the pipes are simply forced into the sand by a sand pump working inside. This was the system actually employed at the Archibald Mine and at the Max Mine, near Michalkowitz (Upper Silesia.) When the force of the liquid soil is considerable, a boring machine is used which puts down four pipes at a time, and is worked by the Schonebeck water-jet system. If the fluid soil is not at a great depth below the surface, the pipes are arranged in such a manner that a shaft of the desired dimensions can be sunk inside of them. But when this water stratum is at a great depth, and the sinking of the holes would be too costly, the shaft must first be sunk to water level with a diameter about one *metre* greater than the finished diameter; this larger shaft is timbered and the freezing pipes sunk inside.

If the water-bearing stratum incloses boulders, etc., of considerable dimensions, the holes are either inclined to avoid them, or they are removed altogether, or they are pierced through by special apparatus. As this method can be applied horizontally as well as vertically, the *Engineering News* suggests that an excellent point upon which to test its value in this country, would be the Hudson River Tunnel. In this case the silt and sand is very uniform in composition, and it should be no difficult matter to congeal the material in length of 100 or 150 feet at one operation.

THE EQUITABLE GAS MACHINE.

The Equitable Gas Machine.

An illustration is given on this page of the "Equitable" gas machine, intended for the artificial illumination of private houses, churches, public halls, machine shops, etc. The apparatus is quite simple, and is intended for the production of hydro-carbon vapor gas, by forcing ordinary atmosphere through a small body of gasoline, and directing the same through pipes to the various burners, in precisely the same manner as if coal gas were used. The reservoirs of the gasoline and the machine are separated, as shown in the cut, and the fluid is supplied automatically to the evaporating material as fast as it is used. By this method the body of gasoline is not exposed to the evaporating process, so that the last gallon is of the same gravity as when first poured in, and the lights are of the same brilliancy, because the generator being automatically supplied with fresh gasoline, there is no gas accumulating in the machine if no vent is made for the gas to pass out. The machine is completely at a stand-still if all the burners are closed.

This machine has a dry blower, which requires no water or other liquid, so there is no danger of any freezing. The air forced through is dry and pure, so it cannot produce condensations or a dim light. The air pump or blower is in the cellar, or anywhere about the house and the reservoir is at a distance from it. As seen by the engraving, the blower, with its motive weights, is in the cellar, and a pipe connects it with the carbureter. The gasoline tank, A, is filled from a barrel by the pipe, E, and the barrel removed and pipe closed. The carbureter is represented by B, and from it the gas-pipe runs, a cock, M, serving to turn on or off the gas. J is a glass tube, to ascertain the amount of gasoline in the carbureter, A. A cock, K, is used for draining off the gasoline in case the machine is removed. G and F are vent and gauge-cocks for the gasoline tank.

The blower is operated by the weights acting on a cord and spool, a crank being used to wind this up.

H. P. Gregory & Co., No. 2 California street, in this city, are Pacific coast agents for this apparatus, which has been extensively introduced in the Eastern States.

Gasoline is not forced into the pipes, and the light produced thereby, as many suppose. The gas generator in the carbureter carburets the air, forming carbureted hydrogen gas, which is the substance burned.

JAPAN is rapidly multiplying her industries. She is the New England of India in industrial enterprise. She will soon start a new plant of iron works at Kobe, by a native capitalist, who has engaged several hundred men trained at the Alabama Iron Works and elsewhere in Tokio.

WATER MILLS ON THE COMSTOCK.—It is said that the Virginia and Gold Hill Water Company are making arrangements by means of which water mills will be put up in operation on the Comstock for the reduction of low-grade ores. The *Enterprise* says "with a quantity of water to run one mill turned loose here on the lode, other mills might be put at short distances, all the way down Six-mile canyon. There would be little loss of water between mills, and the last of the series would be about as well supplied as the first."

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Helena, Montana.

Montana's capital is destined to be a city of great importance as the Territory of which she is the present metropolis develops and becomes enriched by the labors of miners, farmers, stock men and manufacturers. The Territory seems to have entered upon an era of permanent and sure progress. The chance and transitory discoveries of placer diggings in the early '60s has been followed by the opening up of quartz levels of great richness, and of almost limitless number. The mountains that rib the western portion of the Territory seem to abound in ledges of metal-bearing quartz. These ledges are fast being penetrated by the pick of the prospector, and it would require a volume to record the discoveries that are being made each year in the direction of valuable mining property. Capital does not need to hesitate for a chance for remunerative investment. If it does hesitate it is only to select the relatively richest claims out of the hundreds which would be classed as excellent in any other region. So in the future, as present claims become exhausted of their most valuable ores, other mines of equal merit will succeed them, and we shall see a constant progression in this great field of industry. Agriculture and stock raising will advance hand in hand with this sister industry, and the tillable lands which now lie idle shall yield a rich return to the thrifty husbandman. As the commercial and geographical center of this developing region, Helena will expand and grow rich. Already the effects of growth in the Territory during the past five years have made this a city of comparative solidity. The buildings, which are now being erected in great number, are built so as to endure; they are constructed somewhat in view of prospective needs. They would be an honor in many cities of double or treble the population of Helena. But the day is not distant when the wants of the city will cause even finer buildings to go up as many of the old frame landmarks shall disappear, and then we shall see a city indeed the "Queen of the Mountains," as she is now fondly called by her admirers.

Helena had Its First Growth

From the tide of miners who came to Last Chance gulch in consequence of gold discoveries in 1864. There were many bars and gulches which were yielding good returns to placer miners at that time in the Territory of Montana, the richest being in the vicinity of Virginia City, 125 miles or so south of the present site of Helena. But in 1864 and 1865 the excitement was transferred to this region, and the present city, as the center for all, became an established depot for supplies. In 1874 the capital of the Territory was removed here from Virginia City. It is, by all odds, the most suitable city in the Territory for the seat of government. It is the present center of population, and quite as accessible as any other place which might be chosen. Being the capital, there are located here many institutions or affairs of Government, which draw in the citizens of the Territory, so that the floating population of the city is comparatively large. This tendency is increased by the mining developments of the surrounding country, so that we see here numerous hotels, most of which are doing a good business. Among these, the Cosmopolitan stands chief and best. It is central and well kept. The city is incorporated, having a mayor, ward supervisors, and all customary city officials. The site of the city is not advantageous to fine and regular streets, being upon either side of Last Chance gulch, and extending over beyond Dry gulch, each with shelving banks. But the streets are fast being graded, and now there are three or four main avenues extending out into the valley below the city which are fine drives and which are rapidly being lined with neat and tasty residences. The city lies well up under the mountains, and overlooks quite an extended valley to the north, called the Prickly Pear valley. The altitude of Helena above sea-level is 4,266 feet. The immediate country surrounding is not highly productive in an agricultural way, but could be made so by irrigation. The wheat lands tributary to the city are mostly in the Missouri valley, some ten miles to the eastward, where, for many miles up and down the river, upon the bench-lands, a fine grade of wheat is raised. The mining regions which are also tributary to Helena are not close at her doors, but they are still so situated that they most naturally look to her as their supply point.

The present population of this city is said to be 8,000, which we should think a very reasonable estimate. From the statistician of the *Independent*, we learn that, in the matter of building, Helena had, in May last, buildings and improvements in process of construction which would reach in value about $600,000. The same authority estimated that fully one million dollars would be spent in building operations during the season. The statement seems plausible, and speaks volumes for the enterprise of this growing city.

The city has three times been devastated by fire, so that the official seal of the corporation very appropriately bears the phœnix, rising from her ashes. There are abundant educational advantages; in the way of public schools and colleges, and each of the leading religious denominations owns a church edifice. Several of the fraternal orders are also represented. Manufactories are growing, and already there are numerous well established institutions in this line. Tatem & Ellis have in operation a foundry and machine-shop, which was established in 1867, and which now manufacture complete plants for mining operations. They employ from 15 to 20 men regularly. They manufacture quartz-crushing, amalgamating, concentrating, mining and general machinery, iron and brass castings, etc., all from original patterns, and of first-class style. A flouring mill with a capacity of turning out 100 barrels per day, is now being erected by Sanford, Evans & Co., in the lower part of the city. The machinery will be the best style of roller mill that could be found, manufactured by the Pray Manufacturing Co., of Minneapolis. The idea is to make a home market for wheat, and to find a home market for flour. Gebauer & Yergy, have a planing mill on lower Main street, where they manufacture sash, doors, and blinds and where they are kept very busy at present in preparing builders' material for use in the construction of the large number of structures which are now going up. Stedman & Banes have a foundry and machine-shop in the same vicinity, where they employ from eight to ten workmen in repairing and manufacturing machinery. At present quite a specialty with them is iron fronts for buildings, some of which they have shipped to Butte and elsewhere. They are soon to go into new and enlarged quarters. Gas works, to supply the city with gas, are also being constructed. The electric light is already placed in many of the leading business houses, and the busy part of the city will soon be lighted by this means. All will be supplied by generating apparatus in a good-sized building near the center of the city. A United States assay office, where bullion is bought for the Government, as at the branch mints of the country, is established at Helena, and does a considerable business. During 1883 this establishment received about $800,000 worth of gold and silver, all but one-sixteenth of this amount being in gold. Since beginning operations in 1877, it has received about $5,000,000 worth of these metals, nearly four-fifths of which has been in gold. Helena is the seat of the United States Land Office for the district in which she is situated. Here some $100,000 is taken in annually from the sale of Government lands. Helena is also the county-seat of Lewis and Clarke county, which is an irregularly shaped county running far to the north of its seat of government, but sparsely settled in its northern portion. The city has a commodious opera house, and other ample means for the amusement of her people. It has lately been, and is each year, the seat of a Territorial fair, which brings here for exhibition some exceedingly fine stock and agricultural productions of considerable merit. The stories which are now being circulated about Montana potatoes almost throw in the shade those which we see every year about the beets of California. Many potatoes have been plowed up the present season which weigh 2½ pounds, and one gentleman tells of a field in Meagher county, where the crop, after it was dug, literally covered the surface of the ground. Nineteen of the larger of these potatoes weighed about 20 pounds.

The Mining Districts Tributary to Helena

Are not by any means confined to the county of which she is the capital. We cannot mention in detail the developments and prospects of these tributary regions. Below will be found an account of our observations in two or three of the districts in question. Some placer workings are still maintained in the locality of Helena, and even within the very limits of the city three or four gangs of men, with hydraulics, are washing the gravel of Last Chance gulch. We presume some $100,000 are yielded each year from hydraulic and placer works in this immediate section of Montana. From trustworthy informants we learn of recent valuable discoveries and prospects of quartz leads in the Red Mountain district, some 15 miles southwest of Helena. No reduction works are yet adjacent to this region, but the richness of the leads will probably soon cause improvements of this kind to be put in. There are also the Ten Mile district, the Russell district and the Vaughn mines, all lying in the same vicinity, where prospecting has proved the existence of numberless ledges of valuable ore.

Marysville and Gloster, M. T.

No description of Helena would be complete without a notice of the mines at the two points named in the above heading. The places are reached by stage, and lie in the mountains some 20 and 23 miles, respectively, in a northwest direction from Montana's capital. The road leading there crosses diagonally the plain back from Helena, and some seven or eight miles from town passes over a low divide, and at 12 miles distant reaches the valley of Silver Creek, at the ancient placer mining camp of Silver City. Here stage horses are changed, and an additional (a third) span hitched on to carry the load up the heavy grade which follows along the creek. All the way to Marysville there are observable the old workings of a placer camp. The entire bed of the stream has been washed over, and the promiscuous heaps of gravel lie about as the miners left them some 15 years ago. There is a little placer mining still done by Chinamen near Marysville, but no very great returns are received. The road up the creek is a fairly good one, and the staging therefore quite easy. Marysville is reached in about four hours. The little town lies at a point where the creek canyon is narrow, and on the opposite side of the stream from the famous Drum Lummon mine, which is virtually the support of the place, and the one cause of its springing into existence. The Drum Lummon is a mine originally discovered by Thomas Crnse, now of Helena, who sold the property a year or two ago to English capitalists, who have since erected here extensive and excellent works. At present some 125 men are employed about the mine and the mill, all being under the supervision of Geo. Atwood, Esq., acting superintendent, who has his residence close to the mine. The capacity of the mills of the company is 60 stamps—10 stamps in the old Cruse mill and 50 in the new mill, 20 of which were started in April last, in an addition to the mill completed at that time. The ore worked is almost entirely gold-bearing. It is a free-milling ore, and is handled quite rapidly, some 160 tons being crushed each day. The process is simple, but the machinery about the mill is the most perfect of its class. The 50 stamps and 24 amalgamating pans, besides necessary settlers, are run by one engine, which is itself a beautiful machine. It is from the Union Iron Works, San Francisco, with the O'Neil and Scott cut-off, and to say that it does its work beautifully and well would be faint praise. When steam was first let on from the throttle valve it started in motion like a veteran, and has required no adjustment since. The ore is brought from the mine both by way of a tunnel and a shaft. The latter descends into the mine a little distance up the hillside from the mill, the ore being brought down to the dump or chute by means of cars upon an elevated tramway. The tunnel cuts the lode at 400 feet from the surface, from which level, and at the 130-foot level, most of the ore is taken. The tunnel itself is 1,200 feet long. All operations at the mine, in the way of hoisting, drilling, etc., are done by means of compressed air, for which one of the largest air compressors ever made is in use at the mill. It is of 500 horse power, and has its own special engine. This, too, is the work of Prescott, Scott & Co., of S. F. The Drum Lummon is a grand piece of mining property, and it is to be hoped that the present plant may be kept in steady operation for years to come.

The Gloster mine gives name to the little settlement near it. The place is reached from Marysville by crossing over two high hills and through a deep gulch between them. The mine and mill lie about half a mile apart, upon the sides of another steep hill. Ore from the mine is carried down to the mill on a tramway, the loaded car raising in its descent the empty car that had preceded it. This tramway is fully half a mile in length. At the mine, practical operations are under the supervision of Thos. L. West, a miner of considerable former experience in California and Arizona. The shaft has penetrated to a depth of 400 feet. There are levels at each 100 feet, and these are well opened out. The ledge is clearly defined and easily worked. Some 180 to 200 tons, the capacity of the mill, are raised each day, and the engineer is kept tolerably busy in the work of hoisting and lowering. The mine employs about 60 men, and the mill about 40. At the latter place Mr. D. M. Sutton is foreman in charge, who also is a former worker in the mines farther west, having spent several years in Nevada, and being a resident of the Pacific coast since 1863. The machinery at the Gloster mill is very complete and fine. For the stamps there is in use a Corliss engine of 150 horse power, while for the amalgamating pans, settlers, etc., an O'Neil engine, from the Union Iron Works, is used. Each does its work smoothly and well. Sixty stamps are in operation, which are kept lively at work to crush some 200 tons of ore per day. But the ore is brittle and easily worked. Like that of the Drum Lummon, it is gold-bearing. After being crushed, and lying ready to be charged in the amalgamating pans, it resembles closely the sands of the seashore. The Gloster is a profitable and well managed mining property, and has an era of great prosperity in store for it.

The towns of Marysville and Gloster with the mines and mills there located, are important adjuncts to Helena's prosperity. She is their natural supply point, to which they send for all needed supplies, almost as if they were located at her very feet.

Wickes, Corbin and the Comet.

One of the chief mining interests centered at Helena is that of the Helena Mining and Reduction Co. The main works of this company are at Wickes, some 20 miles southwest of Helena. To that point a branch line of the N. P. R. R. has been extended, following up the canyon of the Prickly Pear, into the center of a very mountainous region. At Corbin, some four miles back from Wickes, are concentrating works which treat the ore from the Alta mine, which is itself a mile and a half from Corbin. Both mine and concentrator are the property of the company above named. The concentrator turns out for the reduction works at Wickes about 150 tons of concentrates per day, which are hauled to the latter place by cars. It is one of the finest pieces of property in this line that there is in Montana. The plant was mainly supplied by the Fort Scott Machine Works, and includes the sizing jigs and Retinger tables of this system, though there are also in use some Frue vanners. The works are under the able management of Mr. M. L. Comisky, inside foreman, and Mr. Wm. Winlaw, yard foreman, both, faithful and able workmen.

The concentrating works at the Comet mine are capable of treating some 80 tons of ore per day. This mine is about four and a half miles from Wickes, and from the mine to the concentrator the ore is soon to be brought over what has been noticed by the PRESS as one of the longest tramways in the world, viz., two and a half miles. Mr. C. Huson of Denver has been superintending this tramway, and is yet on the ground. Mr. E. D. Reynolds, of Butte City, will, probably, after the departure of Mr. Huson, represent the interests of the company having in hand the construction of this tramway; and if it proves the success anticipated, we have no doubt he will be called upon by various corporations to give estimates on similar works elsewhere. It is among the probabilities that the ore from the Alta will be taken to Corbin by a similar process as that at the Comet. The concentrates from the latter mine are taken by teams to the smelters at Wickes. Thus it will be seen that the reduction works at this place handle about 230 tons of concentrates per day. To do this there are two large blast furnaces, six Bruckner cylinders, eight calcining or reverberatory furnaces, 25 stamps, six amalgamating pens, two settlers, etc. Generally speaking, the ores from the Comet and the Alta are tolerably low grade and very base, carrying gold, silver, copper, zinc, lead, antimony and arsenic, so that concentration was found necessary to make the reduction of the ores profitable. Indeed, before the present management assumed control, over a million dollars had been lost in the enterprises of the former company or companies. Now, by careful concentration, an economical and thorough treating at the smelters, a different result is obtained. The total yield in bullion since the company began operations, about the first of January last, has been $806,604, and during May there was a phenomenal yield of $155,000. From these figures it may be assumed that the Helena Mining and Reduction Works are returning a profit to the stockholders. The total number of men employed about mines, concentrating works and smelters is from 380 to 400. The officers are: S. F Hauser, Pres.; D. C. Corbin, Vice-Pres. and Treas.; J. W. Buskett, Sec.; John Longmaid, Supt.; John R. Gilbert, Asst. Supt. No matte is shipped from Wickes, but the result of operations goes out entirely in bullion, and is shipped to Newark, N. J. This bullion contains a large percentage of lead and other base metals. As one sees the slag drawn off from the blast furnaces, and notices the sure indications of other metals, notably zinc, which are thrown away with this refuse, he cannot but regret that the processes are not thorough enough to save all of the valuable minerals which the ores would yield. The day may not be far distant when in Montana this will be done.

The Gregory and the Elkhorn.

These two properties, under separate management, with headquarters at Helena, were not personally visited by our reporter. From Mr. C. L. Vawter, Secretary and Manager of the latter property, we learn that the average production of bullion per day is $500, obtained from a run of 12 tons. The mill has 10 stamps. The process of reduction is the chloridizing system, and the metal yielded is silver. The paying ore is taken from the 300 foot level in the mine, though the shaft reaches a depth of 360 feet. About 35 men are employed. The machinery has been in operation since January last. Geo. O. Kilbourne is the Superintendent at the works. This mine is 45 miles from Helena, Jefferson City, on the Wickes branch of the N. P. R. R., being the nearest railroad point. We did not take statistics concerning the Gregory at Helena from the gentlemanly Secretary, Mr. A. F. Seligman, feeling certain when there that we should visit the mine from Wickes. But at the latter place we were disappointed in our contemplated trip, and shall therefore be obliged to pass this valuable property. Some additional notes are given in another column.

CUMMER ENGINES.—A short time since, the West Shore Railroad Co. sent out requisitions to the different engine builders, to which they had a full response, and, in the face of much lower prices, they have just placed their order for a 300 H. P. Cummer engine. The engine is to supply motive power for their large shops at Frankfort, N. Y. The Cummer Co. felt quite elated at receiving this order, as it comes in the wake of an order received from the Pennsylvania Railroad Co., under similar conditions, and under just such as severe competition. The engine for the latter Co. has just been shipped, and will be used in their extensive new works at Indianapolis, Ind. The Cummer Co. has also just been favored with orders for a 170 H. P. engine for the Hadley Cotton Mills, Holyoke, Mass.; a 130 H. P. engine with outfit complete for the Upton Manufacturing Co., of Battle Creek, Mich.; and two engines, 70 H. P. each, for the Citizen's Electric Light Co, Akron, Ohio. Cummer engines have just been started at the Louisville Exposition, St. Louis Exposition, and in the flourishing mills of Cheesman & Drieshach, Tonganoxis, Kansas. The above company report work on the three large Ballantine refrigerating machines for Joseph Heusler, of Newark, N. J., progressing very rapidly, their orders still on the increase, and a splendid outlook for future business.

MECHANICAL PROGRESS.

Smelting and Casting Iron.

A German journal, the *Metallarbeiter*, says: The metallurgical processes employed in the extraction of iron, produce a metal which contains carbon, silicon, manganese and other substances. Pure iron, having a very high fusing point, is not well applicable to foundry purposes; the material we have to examine is iron combined with carbon. The presence of carbon, it being combined and disseminated as graphite through the iron, causes a lowering of the fusing point. When pig-iron is molten in a cupola furnace, the air comes in contact with particles of the liquid metal and the carbon thereof; the metal is partly decarbonized. The impurities, silicon, manganese, and a small quantity of iron, are converted into oxides, producing the slag.

Other products of oxidation, carbonic oxide and iron oxide, are dissolved in the molten iron. The air blown into the furnace generally contains aqueous vapor, and by its action upon burning coke hydrogen is generated. Molten iron, possessing the property of dissolving three times its volume of hydrogen, as has been shown by latest investigations, is thus charged with carbonic oxide, hydrogen and iron oxide. On the cooling of the metal, the gases are emitted. They are the causes of the spongy, pumice-stone-like surface structure observed on solidified metallic masses.

Iron being molten at a low temperature, and then tapped off and poured into molds, liberates the dissolved gases within the mold. The structure of such a casting exhibits the presence of cavities and a high degree of porosity. Such cavities have pease-like shape near the surface, and assume that of a sphere toward the center of the metal; they are sometimes connected with each other by small channels. When heated more rapidly and far above its fusing point, iron becomes more applicable to foundry purposes. The molten metal remaining for some time in the ladle and being agitated by the aid of a bar before it is poured into the molds, permits a free elideration of dissolved gases.

The property of iron of absorbing gases and iron oxide is increased by remelting of iron; for the homogeneous castings iron must be used which has not previously served the same purpose. The spongy structure of a casting is also caused by the molding material. When the orifices of a mold become gradually filled with molten metal, the escape of gases depends on the physical nature of the molding material. The latter containing moisture and organic substances generates aqueous vapor and other gases. These cavities are covered with a film of oxidized metal, while those produced by dissolved gases have a bright metallic surface.

The difficulty involved in the casting of homogeneous articles is partly overcome by the use of a suitable porous sand. Another class of cavities is that called druse. The cavities of a druse are studded with iron crystals of a dendritic form. The formation of these cavities is caused by an abnormal shrinkage during solidification. Another phenomenon generally called sucking must be assigned to the same cause. It is generally observed on parts of castings where a large quantity of metal has been collected. It is therefore advisable in the manufacture of castings to give them an equal wall thickness, which has the advantage that the tension is most equally distributed throughout the mass. On the cooling of the liquid metal within the mold, the particles which are in contact with the mold are sooner solidified than those more distant, and promote a motion of the liquid material from places of greatest to such of less accumulation, thus forming druses.

Bessemer Steel for Edge Tools.

How nearly Bessemer steel can be brought to crucible in its usefulness for tools is a matter than which there are few more important to the machinery engineer. The advance of the Bessemer metal in this respect means to him a considerable saving of money. Rapid advances are being made in the quality of the Bessemer metal. This is amply illustrated by what is now going on at the colossal establishment of the Barrow Hematite Steel Company. In addition to an extensive output of rails, fish plates, railway ties and axles, square, round and flat bars, hard and soft steel blooms and billets, suitable for steel and tin-plate making, etc., and such like heavy production, the company are regularly making upward of 1,000 tons per week of "special steel," for purposes for which only Swedish Bessemer charcoal and best scrap iron were formerly considered suitable. This special steel is worked up in various parts of the Kingdom into roll-turning and lathe-turning tools, chisels, files, shear blades, rail drills, rail punches, shear steel for welding to iron, miners' drills and tools, picks, shovels, hand hammers, roller, bar and cotton spindles, locomotive engine, wagon, carriage, coach and furniture springs, bolts, nuts, rivets, pit ropes, telegraph, crinoline and corset wire, umbrella frames, wire for musical instruments, etc.; it is even claimed that the steel is suitable for the manufacture of cutlery and razors, and is to some extent being used for these purposes. Touching the extent to which the articles answer, it may be mentioned that an inch pit chain, made from a soft sample of this special Bessemer make, withstood a breaking load of 35.63 tons elongation, 6 inch or 18 inch. The welding had been done by a smith not accustomed to chain work. This is very encouraging to machinery engineers, with whom Bessemer steels are gaining favor to the supplanting of cheap cast steels.

WIRE WOUND GUNS. Experiments are still in progress for perfecting this description of guns and the Ordnance Department of the Army are expecting important results from the machine now ready at the Watertown Arsenal for winding wire on guns of 10 inch caliber. The present machine, the invention of Dr. W. E. Woodbridge, is a great improvement on the former attempts in this direction. Some years ago, it appears, the Government made some experiments in the same direction by winding the tube with ¼-inch steel bars and filling the interstitial spaces by running in metal bronze. The Getty Ordnance Board made some important practical tests of this process of gun manufacture, but through firing the gun to extremity, ruptured it at a weak point in its construction.

The Woodbridge system of manufacturing wire-wound guns has thus far been a success. The trials will be made with steel tubes from the Midvale Works, Pennsylvania; the Otis Iron and Steel Company, Cleveland, Ohio, and the Whitworth Works, England. The experiments under the Ordnance Department of the Navy for 6-inch guns have demonstrated the superiority of American steel.

MACHINERY. — The World's Exposition awarded a contract on the 9th of last month for 10,000 feet of shafting, with couplings, hangers and pillow blocks, for Machinery Hall to a Pittsburg firm. Machinery Hall has seven lines of shafting with a total length of nearly two miles. Twenty-four engines, furnishing 5,500 horse power, parked in the central space, 50 feet wide by 300 feet long, will drive the machinery. About half of the boilers necessary have been secured. The total capacity of all of them will be 6,000 horse power. Pumps supplying 4,000,000 gallons of water daily from the Mississippi river have been furnished. The Cummer Engine Company will supply the cold storage plant for the immense meat, fish and fruit display; filter and cool ice water for all the buildings and fountains to 40 degrees, and furnish the Exposition with all the ice required. Drinking fountains for visitors are being provided throughout the buildings and grounds. A thorough plan for the water supply for the buildings and fire department has been adopted. —*Commercial World.*

TACK-MAKING MACHINE, AN IMPORTANT INVENTION.—A Connecticut man has perfected an automatic machine for making upholsterers' tacks, and is producing the goods at Torrington. These tacks have so far always been imported, and the secret of the English manufacture is not known. Various attempts have been made in this country to devise machinery, for producing these goods, but resulting in failure. One firm sank $20,000 in the endeavor. Another firm 15 years ago, partly succeeded, but failed financially. The new machine turns out perfect tacks at the rate of 150 per minute. An average day's work is 60,000. One man can take care of four of these machines. By using different dies the heads may be either round or cone-shaped, and several sizes can be made. After shaping, another machine polishes the face of the metal. The immense quantity used is shown by the fact that an importer in New York receives eight or ten million of these tacks monthly.

THE STEEL NAIL QUESTION.—Reports from West Virginia, where the manufacture of steel nails has been commenced, indicate that the steel nail question has begun to assume a serious aspect. The amalgamation is out in a card to-day, in which it calls upon all nail consumers to reject the steel nail and leave it on the hands of the manufacturer. It asserts that the iron nail is better, cheaper, and in every way more suitable than the steel nail, and denounces the latter as a direct stab at organized labor. The manufacturers have introduced it for the sole purpose, the card claims, of breaking down the amalgamation and forever subjugating iron trades unions. If the steel nail is taken up by our local mills it will throw out boilers, heaters, rollers and laborers to the number of 3,500, and put them on an already overstocked labor market. There is trouble ahead, and much anxiety is felt in business circles here.

LOCOMOTIVE WORKS. There are now in the United States 16 locomotive works, not including the shops owned by railway companies. Pennsylvania has five of these, New Jersey and Massachusetts, three each; New York, two; and Rhode Island, New Hampshire and Maine, one each. These works give employment to 14,000 men, and every year add about 2,600 locomotives to the 20,000 now in use. The locomotive engine of to-day is a marvel of simplicity and beauty. Probably no other machine extant shows such progress toward perfection, within the last 50 years.

SHIP SHEATHED WITH GLASS.—The *Popular Science Monthly* records the interesting fact that an Italian ship has been sheathed with glass plates, cast like iron plates, so as to fit to the hull, to take the place of copper sheathings. The joints of the plates are made water-tight by the use of water-proof mastic. The advantages claimed for glass over copper are its insensibility to oxidation and its exemption from incrustation.

SCIENTIFIC PROGRESS.

Is There a Snow Cap on Venus.

The Rochester *Democrat* reports an interesting observation by Mr. I. P. Guldenschuh, of the Rochester observatory, with a seven-inch silver on glass reflecting telescope. On the 17th of August, Mr. Guldenschuh saw in profile on the convex edge of the crescent a brilliant white lenticular spot. This was cut off by a regular curve from the convexity of the crescent. The line of demarkation was sharply defined. He said he had seen nothing like it except the snow cap on Mars. We suggested to him that in all probability he had seen a snow cap on Venus, although at the time we had seen no report of such an observation by any astronomer. This bright, lenticular spot cut into the broadest portion of the crescent, showing that, if it were a polar snow cap, the hole is now turned diagonally toward the sun. This was not very surprising, as the difficulties attending the determination of the axis of rotation are very great, and to this may the inclination of the axis of Venus to her orbit not accurately known. It occurred to us, says the *Democrat*, that Mr. Guldenschuh may have hit upon a discovery of importance, and immediately consulted the authorities upon Venus. We found that the estimated inclination of the axis of rotation is not far from 75°, a fact which would fit the observation. Judging the present direction of the axis, from Mr. Guldenschuh's observation, and tracing the planet back to the time before inferior conjunction, it was seen that there must have been winter at the pole now visible before conjunction, and that summer is now approaching.

Upon consulting Webb's "Celestial Objects," we found in the appendix the following statement, which seemed to explain Mr. Guldenschuh's success: "Much attention has of late been paid to this planet, especially since the silvered reflector has been found peculiarly capable of defining it." In the same appendix it was learned that the bright spot had been seen by Browning on the 15th of March, 1868. It was on the circular limb, about 80° from the south coast or horn. Browning described it as "so luminous as to show projection like the snow on Mars." This confirms the accuracy of Mr. Guldenschuh's independent observation. We are inclined to believe that both observers saw a polar snow cap. With the great inclination of the axis of Venus, one pole must be in darkness for six of Venus' months, and there is reason to believe that there is a great deposit of snow and ice during this period. If the inclination be 75°, the tropics are but 15° from the pole. We trust that Venus will be carefully examined. Perchance the spot seen by Mr. Guldenschuh may be visible in the many refractors owned in this city.

The Uniformity of Nature's Laws.

An interesting lecture was delivered recently before the Vienna Academy of Sciences, by Dr. W. Meyer, on the above subject, in which the lecturer explained that the latest astronomical discoveries showed very plainly the system upon which the universe is founded. Respecting the qualities of light, the professor explained that it passes from all the stars to the earth with the same degree of velocity that the earth's light travels to the stars. The results of spectral analysis were stated as follows: The analysis of the sun's light to the original shades of colors has shown us twenty-five chemical elements, which all exist on our earth also, and no wholly unknown matter has as yet been ascertained. The sun is composed of the same materials as the earth. The sun may be considered the mother of the earth. But the distant fixed stars are of a composition similar to, and in many cases identical with, that of the sun. The red stars are heavier than the white. Then the stars which appear as new to us, not having been observed in the heavens before, develop a glowing atmosphere of hydrogen around themselves. The nebulæ in the firmament are caused, probably, by hydrogen and nitrogen; but it is possible that they are composed of a form of gas unknown to us. The warmth of the stars has also been ascertained. Red stars are the warmest, green stars the coldest, while the white stars have a medium temperature. The laws of gravitation are common to the whole system. This is proved by the so-called double stars, which revolve around each other by the same laws which regulate the movement of the earth around the sun. The law of gravitation is so plainly visible that the satellite of Sirius was not discovered until it had been ascertained that there was an attraction which worked its influence upon the star. The uniformity of nature's laws and the similarity of the materials composing the universe are a sufficient proof that there must be organizations similar to that of our system all over the universe. We see the results of these laws in the world we inhabit, and there can be no doubt that the same powers and the same materials have produced organizations similar to that of the earth in millions of other places, although we can but philosophically suppose their existence, not practically prove it. We must imagine that the earth is inhabited by a small family forming part of the great nation which peoples the universe.

THE LIQUEFACTION OF AIR.—M. Olszewski has contributed to the *Comptes Rendus* some of his further observations upon the temperature and critical pressure of air. He says he has obtained six cubic centimeters of air compressed into the liquid form. This air did not contain carbonic acid or aqueous vapor, and was allowed to evaporate in a vacuum, and also under atmospheric pressure. A very low temperature was thus produced, as low as 205° C., being observed when the evaporation took place *in vacuo*. It appeared, however, that the recorded temperature of the liquid air at the critical point was not so low as that of its constituents, oxygen and nitrogen, separately. Consequently, M. Olszewski was led to think that at the critical pressure the components separated: nitrogen evaporating in the larger proportion. Therefore, although air is a very convenient refrigerant, for various practical reasons M. Olszewski is disposed to prefer the use of nitrogen in his researches upon the liquefaction of hydrogen, as he thereby hopes to be able to command temperatures even lower than that given as the evaporation point of air in a vacuum.

OIL ON THE SEA-DEVICES FOR UTILIZING THE PRINCIPLE.—The practice of pouring oil on troubled sea water has led a Scotchman to design a shell which can be fired from a mortar, and which in bursting spreads the oil it carries over the sea. The shell is fitted with two fuses, which are set alight by the explosion in the gun, and burn although the shell is under water. On the bursting of the shell the oil spreads over the surface producing smooth water. The device was recently tried with success; the object being to still the sea between two ships in order to let a boat pass from one to the other. The shell fired from the ship carrying it (and every ship might carry a few), burst between the vessels, and calmed the waves with the oil.

Another mode of utilizing the principle has been devised which consists of an automatic wave lubricating life buoy. This buoy is furnished with a seamless-brass reservoir running entirely around the inside, and oil is filled in through a hole in the top which is then covered by a screw cap. On each side of the upper part of the oil tube is placed a rose similar to those placed on sprinkling cans, so that when the buoy is hung upon the vessel's stern no oil can escape. The moment, however, that it is placed horizontally the oil begins to escape and covers the water with a thin film of oil, which squirts out rapidly on every side until a large circle is formed, within which the person who has fallen overboard may rest until rescued.

FOR THE ADVANCEMENT OF SCIENCE.—There are said to be in existence, in this and other lands, 1,000 scientific societies. Some of these are devoted to special departments of investigation, while others aim to foster all branches of learning; some, again, are exclusive, being limited to a few individuals of ripe attainments, while others are more popular in their constitution, and aim at assembling into one organization all the scientific men of a State or nation. Hand-books have been issued giving the names of both American and European scientific bodies, and also, as far as practicable, a list of scientists in all parts of the world, with a brief statement of the specialty of each. The two great and leading associations of this character are the British and American, each avowing its aim to be "for the advancement of science." These bodies have just been fraternizing for the first time in their history at Montreal and Philadelphia. The British Association has been in existence 54 years, the American 33.

LIGHTING MILLS BY ELECTRICITY.—At a recent meeting of the Rhenish-Westphalian millers, Mr. Pfankuck, of Cologne, the electro-technologist read an interesting paper on "Lighting Mills by Electricity." The two lights in use for this purpose in the large mills in Europe are the arc and the incandescent flame, and Mr. Pfankuck pronounced the latter to be the only one appropriate for mill lighting. The arc light has to be opened at intervals of a few hours to renew the carbon, whereas the incandescent light requires only the occasional wiping off of the mill dust from the globe, and permits a division of the currents, allowing one or more lights to be extinguished without affecting the others.

THE ELECTRIC LIGHT ON PLANT GROWTH.—Experiments upon the action of the electric light on plants, at the Palace of Industry, Paris, have resulted less favorably than was expected. The naked rays from the electric arc were found to be injurious; after passing through glass they ceased to have any hurtful action upon the plants, but their efficacy was not great. Illumination at night is not fatal to plants, but no proof has been obtained that it is really beneficial.

THE SUN'S LIGHT.—M. Trouvelot, of the observatory of Meudon, after observing the shadows thrown by the faculæ on the penumbræ of sun spots, suggests that the brilliant light emitted by the faculæ, and perhaps the entire light of the sun, is generated at its surface, the presence of the coronal atmosphere being perhaps necessary for its production.

CITRIC ACID AS A DISINFECTANT.—According to the *Journal d'Hygiene*, citric acid is a most powerful disinfectant, preserving meat from putrefaction, and proving rapidly fatal to septic microbia. The soluble citrates have no similar action.

Passing Events.

A new mining district, called Gold Hill, has been found in New Mexico, which is attracting considerable attention, and many men from the neighboring regions are flocking in that direction. A description of the find is given in our Mining Summary on another page.

The Locomotive Engineers have been in session in this city during the week, and have combined pleasure with business, taking various excursions and indulging in sight-seeing, as well as looking out for the business of the Order.

The Montana mines are looking up very rapidly, and last week the largest silver shipments that the mines of Butte ever made in the same space of time were sent from that camp.

COEUR D'ALENE.—The general impression among the best informed visitors to the Coeur d'Alene mining district is about as follows: There are many placer and quartz claims that would prove rich and valuable if capital could be interested to develop and work them. A few placer claims are now paying well, with indifferent methods of working. Considerable litigation has unsettled titles, and financially embarrassed miners, who have been implicated. The region is full of those who came in with greater imaginations and hopes than heavy purses, consequently there are proportionally more "dead broke" citizens, probably, than in any like area in the nation. But there is considerable faith, in Spokane Falls and elsewhere, in the ultimate value of mining property in Coeur d'Alene, and at present, parties with means and with settled plans, are quietly investigating their purchases there, with the intention of making the best of them.

Oxidizing and Chloridizing Furnace.

Mr. John B. Brett, of Oakland, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an improvement in oxidizing and chloridizing furnaces, designed for the continuous operation of oxidizing, desulphurizing and chloridizing of ores. It consists of a vertical flue or stack, into which the ore, in a pulverized condition, is fed by any suitable means, and falls downward through the heat and flame, which enter the stack through a passage from the fire-place. From the foot of the vertical flue an inclined flue extends downward at a sufficient angle to secure the flow of the ore down to the discharge-opening, which is narrowed so as to allow the ore to flow through, the space not being large enough for a current or draft which would carry off the dust.

The cylinder is supported the usual way, on wheels or rollers, so as to be rotated, and stands at a slight angle, so the ore moves slowly and discharges at the end farthest from the inclined flue, into a pit. The fire-place at the same end communicates with the cylinder and supplies the requisite heat to assist in chloridizing. Another fire-place connects by a flue with the lower part of the inclined flue to supply heat at that point. From the end of the cylinder nearest to the flue an inclined passage leads downward into the dust chamber, the bottom of which inclines sharply to a spout within which a screw conveyor revolves, and carries the dust into a receptacle, from which it is lifted by a bucket or elevator and is discharged into a hopper. A pipe or passage reconveys the dust from the hopper into the lower end of the inclined flue in case it has not been completely chloridized. If it is desired to settle the dust more completely within the chamber, transverse partitions may be fixed therein, having an open passage around their alternate ends, through which the dust may travel from side to side as it passes toward the rear of the chamber.

At the point where the inclined flue and cylinder join, there is a hopper with a passage leading into the flue, by which the ore may be supplied with salt, the salt and ore entering the cylinder together, where they are mixed by the rotary motion of the cylinder.

In order to save fine dust from the upper part of the stack, a passage opens from it into the upper part of the dust chamber, which extends up nearly to the top of the stack at each side. The lower end of the vertical portion of the stack is narrowed at a suitable point the same as the inclined portion is narrowed at its discharge end. The dust chamber, which may extend up both sides of the stack, has an opening from its upper end into the stack, and as the inclined passage leading down into the dust chamber, and the passage for the upper part of the stack to the dust chamber are open, while the stack is narrowed at certain points above and below, as described, the draft through the cylinder from the lower fire-place will pass through the lower passage, and carry the dust from the cylinder into the dust chamber, while the draft from the upper fire carries the dust through the upper passage into the same dust chamber. The dust will settle to the bottom of the chamber, and the heated air and gases of combustion will pass back into the stack through a suitable opening above these passages, and these keep up a sufficient draft.

Colville Mining District, Montana.

While at Spokane Falls, our correspondent heard much said about the above named district, in the valley of the Colville river, some sixty miles northwest of Spokane. The region which prospects well is of considerable extent, but there has been little done in the way of development, except upon one ledge. This work is being carried on by a Spokane company, known as the Spokane Mining and Smelting Co. They have tested the ledge at points for 200 feet up and down the mountain side, and find the ore uniform in quality and appearance, in each instance. The ore seems not unlike that of the Comstock lode, at Virginia City, Nevada. The different assays average in value about $50 per ton in silver. The ledge is from 15 to 20 feet in width, and the ore, generally speaking, easy to work. Messrs. Smith and Squires, of Spokane, are the active members of the company owning this property. A town has already been laid out in the Colville district, called Argentum, and different establishments in this section of the Territory are planning to move upon the ground next spring, or earlier. There are fine roads into the district from Spokane, and if present indications are borne out as prospecting and work continue, there will be quite an influx of miners into that region next year.

Technical Society of the Pacific Coast.

The regular monthly meeting of this vigorous young society was held on Friday of last week, Col. George H. Mendell, U. S. A., in the chair. The propositions for membership were W. H. Milliken and J. H. Clemes.

A very interesting paper, "On the Flow of Artesian Wells," was read by C. E. Grunsky, of Sacramento. From experiments made in connection with the measurement of many wells in the San Joaquin valley, Mr. Grunsky has established an empirical formula for these flows, which will be found useful in all ordinary cases. The paper will soon be published in the Transactions of the Society.

Mr. F. Gutzkow spoke of the utilization of wood pulp, and showed the fabric, resembling cloth, made from it.

The President stated that the society had been invited by the Telegraph Hill R. R. to inspect the workings of their cable road.

Mr. Gutzkow described an artesian well in Alameda county, within a few feet of tide-water, which flows perfectly pure water, but is affected by the tide. It flows double the quantity at high water that it does at low. There is no apparent connection with tidal waters. There is considerable soda in the water, as, in fact, it flows about 160 pounds of soda salts per day.

Mr. C. C. Wolcott, of Mare Island Navy Yard, described a somewhat similar experience in a well sunk on the marsh lands of Mare island.

Mr. Poett knew of several of such wells which rise and fall with the tide, at San Mateo. One sunk within eight or ten feet of the bay flows over at high tide, and at low water is ten or twelve feet below the surface, the tide only rising and falling some five feet.

Mr. E. J. Molera described the peculiarities of the eight artesian wells on his ranch in Monterey county. There is no leakage in the pipes, and the shores are very steep. Water was tapped at about 110 feet, after passing through a certain clay stratum. There is a difference of levels in the wells, agreeing with the tide.

Mr. Wolcott described the results of artesian well boring at Mare island, where so far they have not been successful in obtaining good water.

Mr. Hermann described the occurrence of artesian wells in Santa Clara valley.

A discussion ensued on the source of artesian water at different places, which was participated in by Messrs. Wolcott, Molera, Poett, and Hoadley.

Volcanic Activity in Alaska.

About two years ago some severe earthquakes were experienced in Alaska, and from the appearance of the atmosphere, it was surmised that there was active volcanic disturbance somewhere in the Arctic ocean. It was afterwards found that a new volcanic island had risen from the sea close to a small island known as Bogoslov in the Behring Sea. The New Bogoslov, as it is called, is very much larger than the old island, and is connected with it by a strip of gravel beach. The old island had an elevation of about 400 feet, and the new island has an estimated hight of 500 feet. Last summer Capt. Healy, commanding the U. S. revenue steamer *Corwin*, sent his officers to make an examination and to attempt the ascent of the new volcanic island, but they were only partly successful. The nature of the ground rendered progress difficult. It was found, however, that there was an immense fissure or canon extending through the island, from which is issuing great volumes of steam and smoke, but the party was unable to get near enough to determine whether there is a true crater or not. The old island, where lifted up by the eruption, shows vertical sides and is entirely inaccessible except to birds. The marks of the marine vegetation which grew near the water's edge, are now high up the side of the cliff.

The *Corwin* visited this volcano on her return trip for the Arctic, about a month since, and Dr. Youman reports that the old anchorage had deepened so that they had to anchor close in shore. While the bottom had thus sunk in places the rear part of the New Bogoslov had perceptibly arisen, although the signs of activity were even less than in the spring. The Doctor ascended the New Bogoslov.

The *Corwin* returned to this city last week from her annual cruise in Alaskan waters. She reports that Capt. Hague of the Alaska Commercial Co.'s vessel *Dora*, saw the Four Mountains of the Alentian chain in violent eruption about the first of September, when on his voyage from Atkta to Unalaska.

Professor George Davidson, of the U. S. Coast and Geological Survey, says this is a group of four islands with volcanic peaks, but has not been in activity in this century except twice. Two of the single islands to the west-south-west have been in eruption in 1817 and 1830. The present site of activity is about 120 miles west-south-west of the volcano Makushin, which was in eruption not very long since, and which Prof. Davidson's party ascended in 1867.

Astronomical.

There will be a partial solar eclipse, on October 18th, visible at San Francisco. The computation for the determination of the time of the first contact, and the point thereof, have been made for the geographical position of the Davidson observatory in this city, and was communicated to the Academy of Sciences at the meeting on Monday evening last, by Prof. Davidson.

The local mean time of the beginning of the eclipse is 4 hours, 20 minutes and 04.5 seconds in the afternoon of October 18th; and the point of the first contact of the limit of the moon with that of the sun is 34 degrees and 9 minutes to the westward of the north point of the sun, or 82 degrees and 45 minutes from the vertex of the sun's limit round to the westward, so that the point of commencement will be just above the right hand edge of the sun. Prof. Davidson's computations have been checked by Mr. C. B. Hill.

The partial solar eclipse is visible only over a limited part of the earth's surface which reaches from the Sandwich Islands on the south to the eigthieth parallel, north of Wrangel Land in the Arctic ocean; and from the eastern part of the Rocky mountain region to the western part of Siberia where the eclipse begins. The middle of the eclipse occurs at San Francisco a very few minutes before sunset, and the latest contact occurs in the Pacific in latitude 34°, longitude 135° west, in about 600 miles west southwest from San Francisco. None of the observatories east of the Rocky mountains will see any phase of the eclipse.

On the 30th of September Mr. C. B. Hill found the Wolf comet in the Davidson equatorial, about 11 hours 30 minutes, local mean time. It was close to the predicted position, as computed by Messrs. Chandler and Wendell. The bright moonlight and the unsteadiness of the atmosphere decreased the light of the comet so much that it could only be made out as a very faint nebulous mass, in which a very minute nucleus could at times be seen when the atmosphere was quiet for a few moments. The bright glare of the moonlight, and the dismounting of the transit instrument have prevented any micrometric measures being attempted.

LOCOMOTIVE ENGINEERS.—The Brotherhood of Locomotive Engineers, in session in this city during the week, held their annual election. The first office to be voted upon was that of First Grand Engineer, Chief Arthur having been elected at the last meeting to serve for three years. The incumbent, T. S. Ingraham, was unanimously re-elected to serve for the next three years. A. R. Cavner, Second Grand Assistant Engineer, was also unanimously re-elected. H. S. Stevenson, of Sacramento Division, No. 110, was elected Third Assistant Engineer; T. S. Simpson, of Birmingham, Ala., Grand Guide, and Delos Everett, of West Philadelphia Division, No. 45, Grand Chaplain. S. R. Spragge, of Toronto Division, No. 70, was then elected to the honorary position of Second Grand Engineer. It was decided by a majority vote to hold the next International Convention of the Brotherhood of Locomotive Engineers in New Orleans, in October, 1885.

MICHAEL DONAHUE, one of the founders of the Union Iron Works of this city, died at Davenport, Iowa, on Wednesday last.

Retorting Silver Amalgam in Vacuo.

About fourteen years ago, on May 31, 1870, Mr. Franz Gutzkow of this city, obtained a patent for an improvement in distilling "in vacuo:" that is, under diminished atmospheric pressure. The novelty was the application of a steam jet and certain pipe connections for producing the vacuum. At present, when the steam jet is frequently used for a similar purpose, there would be nothing particularly new in that. At that time, however, the modification in the construction of the Giffard injector, which admits of producing a vacuum in a closed vessel, was less known, and little, or not at all, practically applied. The process was intended for distilling alcohol. For certain reasons, he never endeavored to introduce it for that purpose.

At a recent meeting of the Technical Society of the Pacific Coast, Mr. Gutzkow read the following paper "On Retorting Silver Amalgam in Vacuo:"

In August, 1873, however, I published a paper in the MINING AND SCIENTIFIC PRESS, recommending the principle for the retorting of amalgam. I had in view to retort at a much lower temperature than usually required, avoid the leakage of quicksilver fumes, and, in the case of a very coppery amalgam, to draw, after the distillation was finished, a current of air through the hot contents. Reasoning that the lower temperature would leave the metal in a more porous condition, I wanted to oxidize a portion of the copper, and, after treatment with acid, obtain a higher-grade bullion.

Although nothing further was done in the matter, I always thought well enough of my proposition to feel quite complimented when, last year, a distinguished metallurgist, Mr. C. A. Stetefeldt, of New York, took out a patent on the identical idea of distilling in vacuo, by attaching a steam jet to an amalgam retort. As far as any claims of my own were concerned, I wanted to let them rest, and hoped that Mr. Stetefeldt, when he introduced his patent at the Lexington mill, in Montana, last year, would make a success of it. I am informed that he did not; nor was I astonished when I obtained a sketch of his apparatus, which I consider faulty in principle. This circumstance tempts me to try to save a correct idea by publishing my own views how it ought to be put in practice.

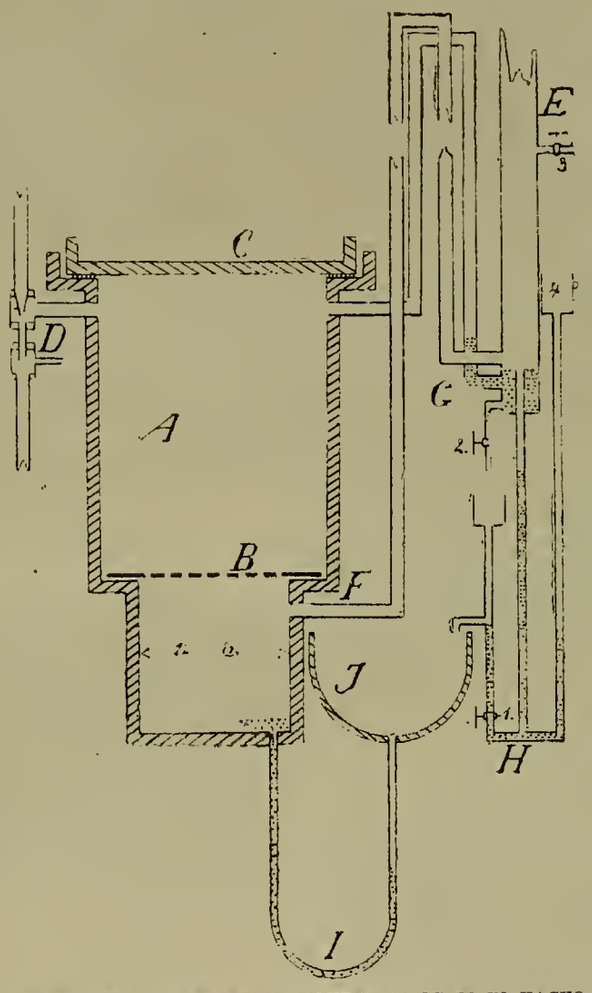
Mr. Stetefeldt blows his steam jet into the 3-inch pipe connecting with the retort, and carries the mixture of steam and quicksilver fumes through a closed sheet-iron box one foot wide, two feet high and four feet long, which is placed in a water trough. The condensing surface is increased by 72 horizontal 1½-inch tubes, secured like boiler tubes, and three vertical partitions force the gaseous current to a curved motion. Thus he obtains only a draft, but nothing approaching a vacuum, and the condensation of the mixture of steam and quicksilver fumes must be very ineffectual. Besides, the plant has an abundance of joints and chances for leakage—certainly out of place in a vessel which has to hold quicksilver and withstand the atmospheric pressure.

My own apparatus is represented by the figure in vertical section. It is somewhat similar to another constructed by me some years ago, for a different purpose, at a gold refinery in this city, which has been described in Percy's "Metallurgy, Gold and Silver," page 484.

A cast-iron tank, A, three feet high, two feet wide and as long as necessary to take in all the retorts of the establishment, is placed in the rear of the retorting furnace in right angle to the retorts. A set-off in the casting supports the sheet-iron, perforated false bottom, B, and a rim or shoulder, extending round the whole tank, carries the cast-iron cover, C. This cover, C, rests on strips of sheet-rubber which, when the air in A is exhausted, and the weight of the atmosphere, amounting to many tons, settles on the cover, is sufficiently compressed to form an absolutely tight packing. The vacuum is produced by the steam jet pump, D, according to well-known principles. The orifice of the jet is one-quarter of an inch and the steam blows, at the distance of one-half inch, into a half-inch pipe three inches long. From the latter the mixture of steam and air expands into a larger pipe, sucking up more or less air from a branch pipe, as shown in the figure, so that when the steam is shut off the vacuum in A is at once brought into communication with the atmosphere. Under a pressure of sixty pounds steam the vacuum corresponding to a column of eighteen inches quicksilver is readily obtained. A much higher vacuum can be produced by certain modifications which I will pass here, as I consider a vacuum of the stated tension quite sufficient for the purpose.

The tank, A, is filled with water to within one foot above the false bottom, the pipes for letting water in or out being omitted in the figure. The pipe, E, connects with the retort. The quicksilver vapor is led from the retort and condensed by a Liebig's cooler in the usual way, so that all the quicksilver thus condensed must flow into E. As long as the retort is not yet hot enough, the air escapes through G. When the quicksilver commences to run, stopcock 2 is shut, the condensed quicksilver closes G, steam is turned on, a vacuum produced above the water in A, and the air or vapor in the retort forced to travel through pipe, F, the false bottom and the water, before reaching their outlet. The water in A need hardly to be renewed during one operation, as it will not get very warm. By far the largest portion of the quicksilver is condensed by the Liebig cooler, and what passes into E is cooled already. Besides, the latent heat of quicksilver-vapor is very small, only about one tenth of that of water-vapor. If the Liebig cooler is made long enough, and constructed after correct principles, that is, in sections of gas-pipe with gradually reduced diameter, the water in the tank A may be altogether dispensed with. In any case, the condensing water in A, must not be allowed to run to waste before it has passed some other vessel where any suspended globules of quicksilver get a chance to settle. If the steam from the steam jet discharges into the same vessel, the settling will be greatly facilitated by the heat. Where the mill-site allows it, this settling vessel ought to be placed about twenty feet below A, otherwise a small Giffard injector must overcome the atmospheric pressure whilst the water discharges from A, during the distilling operation. Small as this inconvenience is, it is better altogether avoided as described above, by bestowing some attention to the construction of the Liebig cooler. The present style of sticking a three-inch pipe into another four inches wide and four feet long is not sufficient to dispense with the additional water condensation, as described, when the speed with which the vapor rushes into the vacuum is considered.

It remains to mention two difficulties: In the first place, there will be required an automatically acting, absolutely safe contrivance which prevents the water from rising into the retort if the vacuum should be suddenly destroyed by leakage or breakage before the workman can open aircock, 3. This is effected by the pipe G, which connects the air-space in A, with the quicksilver at the bottom of E. During regular working the quicksilver will rise in this pipe correspondingly to the hydraulic hindrances of the false bottom and the cooling water. When the vacuum in A is destroyed, the quicksilver in G will fall back and allow the air to enter E. In the second place, it is necessary that the workman can watch the flow of the condensed quicksilver at any time without using stop-cocks or peeping through glass tubes. This purpose is served by the combination of the pipes H and I, and the well, J, with the pipe, E, and the tank, A. The well, J, which also allows to ladle the quicksilver from A, when desirable to do so, receives the condensed quicksilver from E, and discharges it into A. If there is no vacuum in A, this is done by ordinary gravity; if a vacuum exists of, say eighteen inches of quicksilver, the quicksilver in H will stand eighteen inches above its outlet: the well, J, will run empty and the atmospheric pressure will balance a column of quicksilver standing eighteen inches high in the left branch of the pipe, I. It will be readily understood now how the flow of quicksilver into H, from E, will cause its discharge into the well, whilst the flow from the well into I will cause its lifting into A. The level of the quicksilver in the right-hand branch of I, during the distillation below its level in the well previous to the action of the steam jet, serves also as a vacuum-gauge to the workman. Under ordinary atmospheric pressure the weight of the water column in A will cause the rise of the quicksilver in the well by one inch, more or less, but no water can of course escape. By closing stop-cock 1, and ladling quicksilver into 4 until it stands in the funnel, the pipes F and G are converted into barometers, and that particular retort is disconnected from the vacuum.



APPARATUS FOR RETORTING SILVER AMALGAM IN VACUO.

The principal advantages of the described improvement are the prevention of loss of quicksilver and of danger of salivation by leaks in the retort door and the saving in time and fuel by the rapid removal of the quicksilver vapor. For no other substance subjected to evaporation or distillation is the rapid removal of its vapor so necessary as for quicksilver. To compare the distillation, as proposed, and the one now practiced with the evaporation in the vacuum pan of a sugar refinery and in a closed steam boiler, would still not be sufficient to cover the case. Quicksilver vapor has not, like steam, a tension rapidly increasing with a slight rise of temperature, but requires a considerably higher heat over its boiling point before it will escape with energy from a closed vessel. Even then, owing to its high specific gravity, it will move very much slower than air or steam. The well known formula—

$$\text{velocity} = \sqrt{2g \frac{p^1 - p}{s}}$$

in which $p^1 - p$ represents the difference between inner and outer pressure, $2g = 64.4$ = the acceleration of gravity, and s the specific gravity of the gaseous or liquid substance, the specific gravity of the vapors of water and quicksilver at their boiling point being = 0.62 : 6.97 = 1 : 11, proves that under equal pressure steam will escape $\sqrt{11} = 3.3$ times quicker.

The necessity of the speedy removal of the quicksilver vapor from an amalgam retort is also proven every day, when the retorted amalgam is removed. The silver is found half, often quite molten, where it touched the iron, showing the high heat employed, whilst metallic quicksilver may be nearly always discovered in the less strongly heated portion. A superficial observer might take that readily as a proof that the heat was not high enough or the time not sufficient, and forget that quicksilver will as little evaporate in an atmosphere saturated with its vapor as any other liquid will.

In conclusion, I hope that if these points seem of sufficient weight to induce the change in the distillation of quicksilver which I have suggested, it will serve to draw attention to the advantages which the distillation in vacuo offers also for other substances—coal oil for instance. This is a field very little examined into, in which research would certainly be interesting, and possibly valuable.

A Cable Railroad Edition.

We shall, in a short time, issue a large 40 page edition of the MINING AND SCIENTIFIC PRESS devoted to the cable railway system so extensively in use in this city.

This number will contain detailed descriptions of the roads now in operation—the Market, Haight and McAllister St., Presidio, Clay, Geary, Sutter and California Sts., and Telegraph Hill lines. The details of construction and operation will all be considered, and all the desirable information concerning the subject will be gathered. This edition will be very fully illustrated with plans, drawings, etc. All the new improvements in the running of the cable roads will be given. In addition we shall have articles embodying the engineering features of the road. There will also be descriptions of the new and improved appliances of recent invention adapted for use on these roads.

We shall print a very large edition of the number of the PRESS referred to, as the subject is one of such great interest to so many persons. The cable system for the propulsion of street cars is rapidly being introduced into other cities in this country, Europe and Australia. But as it had its inception in San Francisco and is most largely used here, carefully illustrated descriptions of our local roads will be useful to engineers and the public everywhere. Those interested in cable roads, and desiring extra copies of the double number of the PRESS, should send in their orders without delay.

IT is reported that the Mount Diablo Company, at Candelaria, will shortly erect a 20-stamp mill at Sodaville, on the Carson and Colorado Railroad.

THE mines at Bernice, Nevada, are said to be constantly improving. Of late a rich strike has been made there. About 60 men are employed at the mill and mines.

Lost Ledges.

The Mythology of the Desert.

The time will come, says a correspondant of the Calico *Print*, when anything pertaining to the past history of mines upon the desert, or more properly speaking, on the frontiers of California and Nevada, will be read with interest. Then, if the historian follows his text closely, will be found a portion given to the above subject.

It is the writer's object to now place on record the various stories that he has heard during the past 25 years, regarding the various mines or ledges that have been frequently hunted for, and of which there seems to be no certainty that they will ever be found. No doubt there are many old stories afloat that the writer has never heard repeated, but such as he has he will place before the reader and will here also say to the future historians that he can vouch for but little conveyed therein, as it nearly all comes from hearsay, hence the to caption to this article.

The first story of this nature we remember hearing was given us by an old Mexican at Los Angeles in 1861. He said that when he was quite young and then living with the Fathers at the Mission San Fernando, situated a short distance to the northward from Los Angeles, a Mexican would start out in the spring with two mules loaded with provisions sufficient for all summer's supply; that he would take no companions with him, and travel northward towards Elizabeth Lake and return in the fall after an absence of about six months, with his mules laden with silver bullion. This he did for three seasons, but on the fourth he went out as usual but never returned.

The time when this occurred, if occur it did, must have been as far back as 1810, or previous. This old story has recurred to the writer quite forcibly since the discovery of the Calico mines with rich horn-silver croppings as well as a cave or tunnel-like excavation that has since been found on one of the mines. It is possible that this old-time explorer of the desert, wandering northward from San Fernando, came through the natural pass of the mountains, at Elizabeth Lake, thence traveling eastward along the base of the Sierra Madras at last came to the Mojave river, and following down the stream ended his explorations by searching the Calico hills for mineral, and finding the metal in an almost pure state it would require but little skill to reduce it to bullion with any sort of a rude furnace.

So much for that old myth or tradition; of the others to follow, they are all American and of far more recent date.

The Gunsight.

It would be impossible to place before the reader all the different stories the writer has heard regarding the old Gunsight mine, said to have been found by the emigrants of '49, conflicting as many of them do with each other. However, there are two stories that have some semblance of truth and which would seem to locate two separate and distinct finds that year, one of them a gold mine of float rock found in the vicinity of the south end of Death Valley, or what is now near the dividing line between Inyo and San Bernardino counties, and the other a silver mine or float rock, found in the northern portion of the same valley, some 50 miles north of Telescope Peak, the highest point of the Panamint range. For convenience we will designate these as the Silver Gunsight and the Gold Gunsight, and taking up the former, repeat the most plausible story regarding it that we have heard.

Rhodes Party of Emigrants.

During the latter part of August, 1849, a party of emigrants under the leadership of a Mr. Rhodes, coming direct across the plains, entered Death Valley from the east through a natural pass known as Furniss creek, named since that time after a man by that name. Here the emigrants turned northward along the east side of the valley and made their camp at what is now known as Poison Springs. Here a large number were taken sick and 22 died. The emigrants thinking that it was the poisonous nature of the water that had made them sick, made haste to get away. Abandoning their wagons and a greater part of their goods, some on foot, some astride of oxen and some on horseback they made their way westward across the valley, the horsemen riding forward in search of water.

It was while upon this search that a piece of float rock with pure metalic silver was picked up by one of the horsemen, and it is now in the possession of an old lady, one of those emigrants, now residing at Oroville, Cal. In the spring of 1875, a gentleman living in Panamint, who had heard the story of the finding of this piece of ore, induced a young man by the name of Nesbit, who was with the party that found the specimen, to come and assist him in a search for the mine or at least the place where the ore was found.

They went to Furniss creek and thence followed the route that had been passed over so many years before. Arriving at a point some 15 miles northeast of Emigrant Springs and eastward from Town's pass some 20 miles, Nesbit recognized it as being the place where the silver float was found. It was a deep wash that put down into Death valley from Emigrant Springs, and as there is a silver-bearing, black metal ledge crossing the canon at those springs, they thought it possible that the float had come off the outer croppings of this ledge and had drifted down the wash to the place where it was found. As there were no indications of another mine in that section they gave up the search. Many others previous to that, and several since, have hunted for the Silver Gunsight mine but that was evidently the nearest approach ever made towards its discovery.

Paved With Gold and Silver.

Our principal streets are receiving a top-dressing of rock from the waste dumps to put them in order for the coming winter. Very frequently during the summer pieces of good ore have been picked out from among that dumped in the roadway by the carts, but recently it was evident that a new waste dump had been attacked, as there was an unusual preponderance of ore in the material. It seemed, in fact, to be nearly all ore. Close examination, however, showed that a considerable amount of what at the first glance seemed good ore was very base, yet with this base was mingled much rich black sulphuret ore.

From a lot of this dumped on C street, in front of Odd Fellows' Hall, we took two samples which were crushed up together and assayed by J. R. Ryan, of the Consolidated Virginia assay office, with the following result: Gold, $164.75; silver, $168; total, $332.75.

This is pretty good "waste rock" with which to fill in the streets! We induced a millman of Silver City to examine the rock that was being dumped from the street carts. At first he thought it all base, but on looking more carefully he began to find lumps of genuine black sulphuret ore, and finally said: "This is better material than most of that now being taken out on the old upper levels. It would pay well for working."

The assay given above was made after this, and the opinion obtained from the millman was founded wholly on what he saw before him. It is said that the rock of which we are speaking is obtained at a waste dump up near the corner of A and Carson streets. The rock was probably brought out of the old Burning Moscow in the early days. Miners were not then good judges of ore. Some portions of the vein having been assayed and found to be base, it was probably concluded that all was base, as only a practiced eye would note the difference of grain.

Wherever the rock may have been mined, it is evident that it would pay pretty well to overhaul that waste dump. By careful assorting, no doubt a large amount of good ore might easily be obtained.—*Virginia Enterprise.*

NEW ORE HOUSES AT THE ANACONDA MINE.—The Anaconda company is putting up a large and very substantial ore house to enable them more conveniently to ship their ore. The ore is to be run in cars from this shaft to the chutes and there dumped. The ore will then run down into this house and by means of movable chutes will be loaded in bulk upon the cars. It will enable the company to handle if necessary a thousand tons a day. Through the courtesy of Mr. D. A. Gilchrist, the mechanic superintending the construction of the house, we were enabled to get a good idea of the work. The house, is just above the railroad switch. It is put up on timbers fourteen inches square, all bolted together in the most substantial manner. The upper story is a slanting floor, five inches thick, and overlaid with sheet-iron. The floor rests on timbers 12x14 inches in size. Here the ore is to be stored until shipped on the cars. The house is 134 feet loug and has twelve chutes. At the St. Lawrence another house, the duplicate of this, is to be put up. Besides these houses there are other houses where the high grade ore that is to be sacked and shipped to the East, is stored for shipment. All these houses are of the most substantial kind, and if one may judge from the appearance of the buildings the owners of the mine have as much confidence in the mine as have the outsiders.—*Butte Miner.*

A BIG TEAMING PROPOSITION.—George W. Ponter, the leading contract teamster of the southern country, went down the C. & C. road yesterday to figure on proposals for hauling the Mammoth mill to Aurora. A rough estimate of the cost has been made at $12,000, but as some competition has sprung up, the figures have been changed somewhat. The mill was built at Mammoth City, 35 miles south of Bodie, at the time of the mining excitement in that district, when George D. Roberts, George M. Pinney and other speculators manufactured a boom in Mammoth stock and unloaded at a good figure. The mill has 40 stamps and cost $150,000.—*Virginia Chronicle.*

THE PYRAMID FURNACE A SUCCESS.—The Reno *Gazette* of evening before last says: The furnace at Pyramid began running Tuesday and has since been smelting at the rate of ten tons per day, and will run about 5,000 pounds of copper matte containing considerable gold and silver. The copper is worth about 12½ cents per pound. Pierce Evans, the secretary, estimates the value of gold, silver and copper at $600 a day. The ore is worked at a cost of $10 a ton. This is good news indeed, and everybody hopes that the men who have stayed with it so long may realize handsomely from it. Two new furnaces will be put up at once.

New Channels for Raw Copper.

The present low price of raw copper may well be worth all it will cost producers if it serve to direct thoughtful attention to the necessity of looking up new channels for the employment of that metal. An avenue that suggests itself in connection with the annual consumption of a considerable amount of raw copper, is the one leading in the direction of sheathing for roofing purposes. Concerning this, the Michigan *Mining Gazette* has the following: No person erecting a building of any value, whether intended for a residence or place of business, if his attention is properly called to the matter, would hesitate to cover it with the best roofing material, provided the cost would not be too great. That copper sheathing excels all other roofing substances in economy, when its duration and absence of expense for keeping it in repair and value for old metal when it has served its purpose, are considered, admits of no doubt. Buildings can be found in this country, the roofs of which were covered with copper over one hundred years ago, that are in as good condition to-day as when first put down. After copper sheathing is once in place, it requires no repairing or safety covering like slate, tin, iron or shingles, while no reasonable limit can be placed to its lastingness. In Europe copper roofs can be found that were put on over five hundred years ago!

It is not our purpose to amplify this subject; our aim is simply to call attention to the matter for the purpose of invoking a practical discussion of the topic, which, if intelligently carried on, must in time result in the introduction of copper sheathing for roofing purposes.

As an aid in this direction, we give below a table showing the cost, per 100 square feet, for covering a building with copper sheathing, with sheets running from 10 ounces to the square foot up to 16 ounces to the square foot, on a basis of raw copper at 14 cents a pound, and allowing three cents a pound for rolling it; also, a table exhibiting the thickness of the different weight sheets:

Ingot copper	14 cents	
Cost of manufacturing	3 "	17 cents
100 superficial feet 10-ounce copper, 62½ lbs., cost		$10 62
" " " 12 " " 75 "		12 75
" " " 14 " " 87½ "		14 87
" " " 16 " " 100 "		17 00

THICKNESS OF COPPER.

10-ounce copper, 73 6-10 of an inch thick	28	wire gauge
12 " " 01 4 12 " " "	27	"
14 " " 52 8-14 " " "	26	"
16 " " 46 " " "	25	"

Another channel which we think can be made serviceable in the consumption of raw copper is the manufacture of stove-pipe out of cold-rolled copper sheathing. To help those whose interest it is to look up and debate the question of the employment of copper in this direction, we give underneath a table showing the comparative cost of different sizes of stove-pipe, based on retail prices in this section, with that of copper sheathing stove-pipe of various weights and sizes, on a basis of raw copper at 14 cents a pound, and allowing 3 cents a pound for hot-rolling sheets and 1 cent a pound for cold-rolliug them. In connection with copper stove-pipe, the fact must not be lost sight of, that, like copper roofing, after it has served its purpose, the worn out lengths are worth so much for old metal:

Costs of Russian iron stove-pipes—

8-inch stove-pipe,	24-inch length			60 cents
7 " "	24 " "			50 "
6 " "	24 " "			40 "

Cost of common iron stove-pipes—

8-inch stove-pipe,	24-inch length			37 cents
7 " "	24 " "			30 "
6 " "	24 " "			25 "

Cost of 10-ounce copper stove-pipes, cold-rolled—

8-inch stove-pipe,	24-inch length			48 cents
7 " "	24 " "			42 "
6 " "	24 " "			36 "

Cost of 12-ounce copper stove pipes, cold-rolled—

8-inch stove-pipe,	24-inch length			58 cents
7 " "	24 " "			52 "
6 " "	24 " "			45 "

Cost of 14-ounce copper stove-pipes, cold-rolled—

8-inch stove-pipe,	24-inch length			66 cents
7 " "	24 " "			57 "

On a basis of ingot at	14 cents
Hot-rolling	3 "
Cold "	1 "
Total	18 "

A MISTAKE.—A Smartsville dispatch of Monday says: "The war of persecution waged by the Marysville people against the men who have been engaged in cleaning the bedrock, still continues. Sheriff McCoy arrived to-day with a number of warrants for arrests, charging the parties with an alleged contempt of court on August 8th. Hydraulic mining ceased here a year ago, which fact is known to the leading men of Marysville, who are also aware that the largest mines above this place are being run to their fullest capacity, and no efforts are being made to shut them down." It is a mistake that the "largest mines" above Smartsville are operating. So far as Nevada county is concerned, none of them have been piping for some time. A little cleaning of bedrock has been going on in places, but then that is none of the anti-miners' business.—*Nevada Transcript.*

The Yankee Fork Mines.

A late trip to the Yankee Fork country has confirmed, more than ever, the opinion that its mining resources are great when fully developed. The last work done on the Summit, Unknown and Custer show those three to be one lode and that further their strike is in the direction of the Norton Hill, where is the famed Charles Dickens, Juliet, Daniel O'Connel, Pilot Group and others. And still continuing on to the west are, it would seem, infallible signs of great ore wealth. On Jordon creek, which adjoins the Pilot Group, on the creek bottom is a fine field of placers, which have been worked for years by the owner, Mr. J. G. Morrison, with excellent success, producing many thousands of dollars of dust per year. In working it this year, on a high point on the west bank of Jordon creek, Mr. Morrison has taken very good pay for the season, but the indication of good rock is more strongly marked by the coarse gold found there, perhaps, than in any other way. Mr. Morrison showed his friends at Bouanza on the occasion of our visit, a large number of coarse gold pieces, but more particularly a set of beauties—one weighing an ounce, one about three ounces, and another of six ounces in weight, all of which are gems without rock. They are smooth, but the hight at which they were taken indicates a nearness to the place of their birth, and Mr. Morrison from this and other signs that surround the whole premises, is full in the faith that in the ledges on the west side of the Jordon will be found a chimney or two (perhaps more) of immense wealth. We see nothing unreasonable in his theory, but rather everything to show that he is correct, and we look for future developments to prove its correctness. There is no mistaking the fact that the Charles Dickens connects through the Pilot Group, and there can be no reasonable doubt but that the Washington, owned by Mr. Morrison, is a strong vein which connects with the Pilot Group on the west, the same as the Dickens does on the east. Mr. Morrison owns a number of quartz claims on this west side of Jordon, but the Washington is most closely allied to the more noted claims on the through lead. On the west were found those coarse lumps, mostly in close proximity to excellent looking rock of the vein. Assays of different points and at different times speak well for the west side lodes. Work has not been pushed to any great extent on these claims, although on the Paradise there is a tunnel run of three or four hundred feet. The mine lies on the south side of Morrison creek, which puts into Jordon from the west, and this tunnel is run in on the north side of the claim to tap the vein, and then it runs on the lode; the greater portion of its line is to cut the vein, but there has been considerable ore taken from this lead through it. Some surface work on the line of the lode also shows well for ore and directness as well as continuity of the lead. Assays would tell little as to the wealth of these claims, as the rock would run from a small sum to fabulous figures, some being pure gold or nearly so.

The main rock where pay appears to exist is black sulphuret, and, from our examination, we should judge its reduction will require about the same style of machinery that the Custer mine does with, perhaps, this exception, that, as you go west you may find a little more copper. And as you go deeper the show of it is greater. That this is one very large belt of porphyry with different stratas of valuable ore bearing a heavy per cent of gold on top, with silver predominating as you go down on them, and bearing a per cent of copper as you attain greater depth there is little doubt. We by no means could think after all our examinations that the Custer, Charles Dickens and Unknown are all the good lodes that are to be opened on this great belt. And it will not be surprising to have it prove on full development that the richest chutes in the whole range are still further west than the thread of Jordon creek. No coarse gold in the placer grounds reaches above the Washington quartz claim and the body of placer gold has been found on the west of Jordon and below the different quartz ledges—the Washington lies highest up the creek of all leads in the west side cluster. Mr. Morrison says that there has been some new discoveries made still higher on the mountain to the west of all former ones this summer. In our judgment the mines of this region are just tapped on the edge and we sincerely hope and believe ours, this time, is a sound judgment. It is hardly possible that this placer deposited at the mouth of Jordon creek is all that there was in the mountain rock, and it being so peculiarly connected with these veins, which show well, it may be considered that the rock and placer wealth have originally been one and that there is yet awaiting this particular region a great future.—*Idaho Messenger.*

MOLYBDENUM.—Molybdenum, as the mineral molybdenite (sulphide), occurs crystallized in veins about 4 miles north of Pitkin and near Rock creek, Gunnison county, Colorado. The quantity is probably sufficient to render these veins valuable in the future. As molybdate of lead, it is said to occur in Leadville in small quantity, and to be very abundant in Utah. Molybdenite occurs at Blue Hill bay, Maine, and at Westmoreland, New Hampshire. Many other localities have been reported. Salts of molybdenum are used to a certain extent in chemical operations, but the supply is quite limited.

Iridium.

In a paper "On the Application of Iridium to Art and Manufacture," read before the American Institute of Mining Engineers, Mr. Dudley stated that the prineipal sources of supply are Russia and Californuia, the iridium in the former country heing obtained from the platinum mines of the Urals, and in California from the placer gold washings, where, indeed, it is a source of considerable annoyance on account of its specific gravity, whieh is about 19.3, nearly the same as that of gold. Consequently it is impossible to separate the gold from the iridium by the process of washing, and it has to be effected, therefore, hy amalgamation of the gold, or dissolving it out in aqua regia. The possession of or dealing with iridium in any way is forbidden by law in Russia, on account of speculators in gold dust adding iridium to it to increase its weight, the result being that when the gold came to be worked in the mint and the ingots to be rolled into sheets, the individual grains or particles of iridium produced indentations in the rolls, and in striking out the coins the dies were marked and defaced, causing considerable loss to the Government. Notwithstanding its comparative abundance, up to the present time iridium has only been applied (with the exception of alloying with platinm) for pointing gold pens, forming what is called "diamond" point, and being, in reality, a small grain of iridosmine (or alloy with osmium) soldered on to the tip of the pen. Hypodermic needles for surgical use are now made of gold and tipped with iridium, which is not subject to corrosion, like the old steel points, and it is being largely applied to the instruments for surveyors and engineers. In all these cases the combination with the phosphorus by fusion has been the moving power. The application of iridium is now being made to electrical purposes; but the phosphorus in the experiments has to be removed, as being an obstacle to success. This being done, the iridium is available for electrical contact points of telegraphic apparatus, and they are found to be far superior to platinum, the iridium outliving the platinum, and not being subject to oxidation or sticking, as are the latter points, all that is necessary to clean the iridium being to pass emery paper over the surface. Mr. Dudley is now engaged in experiments for plating with iridium, and has succeeded in obtaining a bright reguline deposit of iridium of base metals, which deposit resembles the natural metal, heing quite hard and resisting the action of acids.

Niter.

Niter (saltpeter) is found native in many of the Western and Southwestern States, and in the Territories of the far West. During the war some native niter was utilized, but its quality was poor, and it is said that loss would be incurred in refining it here now.

Saltpeter yards or "plantations" were worked on the eastern sea-board in the early history of this country; and it is noteworthy that at that time the principle of germ fermentation (by mother-of-peter or seedpeter) was well understood, for in preparing a new yard it was customary to "salt" it with the earth from an old yard, the effect, if not the reason, being clearly appreciated.

At present the greater part of the saltpeter used in this country is converted from Peruviaa sodium nitrate and German potassium chloride, the two by interchange forming a pure potassium nitrate or saltpeter. This process is a comparatively new one, having been used only during the past twenty years. As the supply of sodium nitrate and potassium chloride is almost unlimited, and the artificial saltpeter made from them is so superior in quality, being nearly chemically pure, it is preferred to the natural article, and has, to a large extent, supplanted the latter.

Rich deposits exist in India, from which nearly all the crude substanee is imported, some of it (refined) coming by way of England.

Copperas.—The estimated production of copperas (sulpbate of iron) in this country during the year 1882 was 15,000,000 pounds, having an average spot value of three-quarters of a cent per pound. This material is largely made from the waste oil of vitriol from wire and galvanizing works, with scrap iron. It is also made from alum shale. The principal centers of productiou are as follows: Worcester, Massachusetts; New Haven, Connecticut; Buffalo, New York; Philadelphia and Johnstown, Pennsylvania; Cleveland and Steubenville, Ohio; and St. Louis, Missouri. Its principal uses are in paper and print mills, bleacheries, dyeing establishments, chemical manufacturing establishments, paint and ink manufactories, and for sanitary purposes as a disinfectant.

Economical Working.—At the head of the winze ou the 200 level of the Hale and Norcross, is a donkey hoisting engine that is driven by steam carried through a pipe 1,000 feet in length. The steam is generated in a boiler at the old works, and it is found that it reaches the engine with a loss of but five pounds in pressure. This is much cheaper than would be compressed air. The winze is down 85 feet, and the engine does the work of hoisting most satisfactorily.—*Virginia Enterprise.*

Useful Information.

Facts Worth Knowing Around the Laundry.

That by adding two parts of cream of tartar to one part of oxalic acid, ground fine and kept dry, in a bottle, you will find, by applying a little of the powder to rust stains while the article is wet, that the result is much quicker and better. Wash out in clear warm water to prevent injury to the goods.

That cold rain water and soap will take out machine grease, where other means would not be advisable on account of colors running, etc.

That turpentine in small quantities may be used in boiling white goods to a great advantage, as it improves the color, and the boiling drives off all odor. Resia in soap is quite another thing; it injures and discolors some goods, and shrinks woolens. Soap men argue that on account of the turpentine in the resin it assists in the washing. It is used for a filler and to make the soap hard and cheap. It is a fraud on the consumer.

That kerosene will soften leather belts or boots that have become hard from exposure or use around the wash room. Good for the harness when hard from rain or dampness. Wash with warm water, then grease with good animal oil or dressing like the following.

That the government harness dressing is as follows: One gallon of neatsfoot oil, two pounds of Bayberry tallow, two pounds of beeswax, two pounds of beef tallow. Put the above in a pan over a moderate fire. When thoroughly dissolved add two quarts of castor oil then while on the fire stir in one ounce of lampblack. Mix well and strain through a fine cloth to remove sediment, let cool, and you have as fine a dressing for harness or leather of any kind as can be had.

That baking soda gives instant relief to a burn or scald. Applied either dry or wet to the burned part *immediately*, the sense of relief is magical. It seems to withdraw the heat and with it the pain. Keep it in the ironing-room.

That Javelle water, often met with in works or articles on cleaning and dyeing, is made of one gallon of water and four pounds of ordinary washing soda. Boil for five or ten minutes, then add one pound of chloride of lime. Let cool, and keep corked in a jug or tight vessel.

That when acid has been dropped on any article of clothing, liquid ammonia will kill the acid, and then by applying chloroform you will restore the color in most cases.

That "cyanide of potassium" will remove all indelible inks whose base is nitrate of silver. Being a deadly poison, it will be hard to get from the druggest in most cities. Turpentine or alcohnl rubbed in hot, removes the new inks, using soda and soap freely in hot water afterward.—*National Laundry Journal.*

Utilizing Coal Dust.

The French manufacturers of "patent fuel," or bricks of coal, particularly in the Nantes district, import a large quantity of coal dust from Cardiff, Swansea and Newport. The process of manufacture is very simple. The coal dust is mixed with pitch and the mixture poured into cups attached to a belt, each cup containing just enough material for a brick of the size desired. The belt in its movement passes this material through a chamber where it is exposed to steam, which fuses the two substances into a homogeneous mass. This is poured by the descent of the belt into molds, where it is subjected to an enormous pressure by a hydraulic press or by machinery set in motion by a steam engine. The brick is square in form, its thickness being about one-third of its other dimensions, and its weight 5, 10 or 15 pounds. Certain of the French railway companies refuse to accept fuel unless at least 10 per cent of pitch has been used for its agglomeration. It is stated that briquettes are preferable to ordinary coal for exportation to the colonies and to warm climates on account of their compact storage and freedom from small fragments and dust, also for use on locomotives both on account of economy of space and because firemen can always determine the amount of fuel they are employing in a given time, the weight of each brick being exactly known. The manufacturers claim that the patent fuel is more healthy for domestic use than ordinary coal, citing in support of this thoery the declaration of certain well-known physicians. At the present day a large number of bricks are made for domestic use, of small size, and perforated with circular or longitudinal openings.

Glue, Paste or Mucilage.—Lehner publishes in a German periodical the following formula for making a liquid paste or glue from starch and acid. Place five pounds of potato starch in six pounds of water, and add one-quarter pound of pure nitric acid. Keep it in a warm place, stirring frequently for 48 hours. Then boil the mixture until it forms a thick and translucent substance. Dilute with water, if necessary, and filter through a thick cloth. At the same time another paste is made from sugar and gum arabic. Dissolve five pounds gum arabic and one pound of sugar in five pounds of water, and add one ounce of nitric acid and heat to boiling. Then mix the above with the starch paste. The resultant paste is liquid, does not mould, and dries on paper with a gloss. It is useful for labels, wrappers, and fine bookbinders' use. Dry pocket glue is made from 12 parts of glue and 5 parts of sugar. The glue is boiled until entirely dissolved, the sugar dissolved in the hot glue, and the mass evaporated until it hardens on cooling. The hard substance dissolves rapidly in luke warm water, and is an excellent glue for use on paper.

Removing Stains.—A mixture which is excellent for removing grease spots and stains from carpets and clothing is made of two ounces of ammonia, two ounces of white castile soap, one ounce of glycerine, one ounce of ether; cut the soap fine, dissolve in one pint of water over the fire; add two quarts of water. This should be mixed with water in the proportion of a teacupful to one ordinary-sized pail of water. Mix thoroughly, and wash soiled garments in it. For removing spots use a sponge or clean flannel cloth, and with a dry cloth rub as dry as possible. Woolen goods may be made to look bright and fresh by being sponged with this.

Silver for Photographic Purposes.—Some one who has been studying the subject intimates that not less than 40 tons of silver and 3 tons of gold are used in these United States every year in photographic processes. Making this estimate the basis of an additional calculation, by taking the amount of gold and silver required to produce a single cabinet picture, ascertaining the number of pictures that can be made with the amount of these metals as above given, and considering the average price charged for these pictures, it is found that more than $27,000,000 is expended in this country annually for photographic pictures.

Damp Walls.—To keep dampness from the inside rough walls of basement rooms, etc., rake out all the joints and clean the wall thoroughly; then plaster it carefully half an inch thick with a mortar made of Portland cement one part, sand one part. To be applied in a dry time, when no water is coming through the wall. The mortar is held up by the wall, and any considerable thickness of mortar tends to drag itself off by its own weight. The more the mortar is worked into the joints, the better. The cellar bottom may be covered with the same material, but should be two inches thick.

An Air-Brush.—Among the useful and interesting inventions exhibited at the recent photographers' convention at Philadelphia was one called the air-brush. A little holder is charged with India-ink, and by a bellows operated with a foot pedal, after the manner of a sewing-machine, the fluid is blown upon a faintly outlined portrait, the result giving a picture superior in many respects to the best crayon drawing. A life-size portrait may thus be made in a few hours, whereas formerly, by the use of the stump and pencil, as many weeks were required.

Good Health.

Health and the Electric Light.

The good or evil influence of the artificial light we use upon the health is of the very highest importance, although hitherto it has been to a great extent overlooked. Ancient custom has so familiarized us with combustion as a source of light that, until recent years, we hardly dreamed there could be any other. Nevertheless the introduction of the electric light has been opening our minds of late to the advantages of a purer kind of illuminatiou. Pure air is what we all seek when we go to the seaside or mountain top during our holidays. How important then is it that we should have pure air in our homes. The necessity which obliges us to live in towns, also obliges us to live in a more or less vitiated atmosphere. The mere fact of so many living beings crowded together is of itself sufficient to deteriorate the air. Assuredly it is not desirable that the very light we use should also vitiate the atmosphere.

Pure air and light are essential to good health, but in close, ill-ventilated city offices, and in thousands of homes and workshops, what prospect is there of a pure air while the lights, which are often burned half the day, are of themselves polluting it? For not only does a candle, oil, or gas flame waste the oxygen of the air, and thus rob it of its life-supporting virtue, but it actually soils it with noxious vapor, the products of combustion. These are chiefly water or steam and carbonic acid; but carbon dust, or soot, is also thrown off, and in the case of gas, sulphurous acid. Gas and other lights produced by combustion not only rob the air of its health-giving oxygen; they adulterate what remains of it. Carbonic acid gas, which is supplied to the atmosphere from a flame, is an active poison, fatal to animal life. It is the "choke-damp" of the miner; and though always present in minute quantities in the atmosphere, it becomes dangerous when in excess. On the score of health alone the introduction of electric light ought to be hastened as much as possible, nor should it be only the luxury of the rich, as a famous electrician, recently deceased, proclaimed it, but the necessity of the poor. Where purity and brightness are most needed, there purity and brightness should first come.

The effects of the electric light in the present electrical exhibition at Philadelphia are closely watched in this respect, and it has been observed that on the hottest evenings they have neither vitiated the atmosphere nor sensibly heated it, whereas, were these hundreds of lights, now aglow, given off by gas, it is safe to say that the atmosphere of the great hall would be intolerable.

A New and Singular Disease.—Among the curious maladies which advancing civilization seems destined to bring in its train, and one on which the physicians of Paris are just now bestowing much attention, is a kind of obliquity of mind, which is there called *peur de espaces*. The sufferer is usually a person in apparently good health, and the first symptoms of the new disease a feeling of weakness and sickness, which generally comes on very suddenly, when the person comes at some particular place or is brought into the presence of some particular person. He is then observed to be in mortal terror without any apparent cause. The earth seems to open into a chasm before his feet, or he finds himself isolated by an immense and impenetrable space from the rest of the world. If he is on the pavement, he does not step into the roadway. If he is on a step, he is afraid to move up or down for fear of being dashed to pieces in some imaginary abyss. All this time he keeps his reason in everything except this specialty, and is sensible of his absurd position and action, but is incapable of controlling himself. Men are oftener attacked than women, and most of the sufferers belong to the liberal professions, or move in the higher ranks of society.

Sleep for Children.—A correspondent inquires: "Ought young children, who are growing fast, and do not seem strong, to be allowed to sleep in the morning until they awaken? or should they be called at an early hour?" Ans. We do not believe in the special virtues of early rising. The time to get up is when the body is rested by sufficient sleep. Children need much more sleep than adults. It is chiefly during sleep that the processes of repair and growth are carried on. A child that has insufficient sleep cannot develop properly. Children should be taught to retire to bed early, and then they may be induced to get up early in the morning without harm; but if for any reason they are kept up late at night, they should be allowed to sleep in the morning until rested. Care must be taken however, to see that the time spent in bed in the morning is devoted to sound sleep. Dozing or lying in bed awake, should not be allowed in children at any age after they are old enough to understand instruction.

Tired Eyes.—People speak about their eyes being fatigued, meaning that the retina, or seeing portion of the brain is fatigued, but such is not the case, as the retina hardly ever gets tired. The fatigue is in the inner and outer muscles attached to the eyeball and the muscle of accommodation, which surrounds the lens of the eye. When a near object is to be looked at, the muscle relaxes and allows the lens to thicken, increasing its refractive power. The inner and outer muscle to which I referred are used in covering the eye on the object to be looked at, the inner one being especially used when a near object is to be looked at. It is in the three muscles mentioned that the fatigue is felt, and relief is secured temporarily by closing the eyes or gazing at far-distant objects. The usual indication of strain is a redness of the rim of the eyelid, betokening a congested state of the inner surface, accompanied with some pain. Rest is not the proper remedy for a fatigued eye, but the use of glasses of sufficient power to render unnecessary so much effort to accommodate the eye to vision.

Stuttering.—The *Scientific American*, in answer to a query in regard to stuttering by a twenty-month-old child, says: "No medicines will be of any service, but you should have the child examined by some good physician. Stuttering in children is often caused by something abnormal in the mouth or throat; cleft palate, for instance, elongated or diseased uvula, a tumor at some point, etc. It is also caused by hearing some one else stutter; the remedy for this is of course to keep them away from the influence. If neither of these causes exist, you must wait; nothing can be really done to break the habit before the child is six or seven years old."

Eucalyptus in Whooping Cough.—The editor of the *N. E Medical Monthly* having seen eucalyptus globules administered for whooping cough, gave it a trial in his practice in some 25 or 30 cases, with great success. Its effect was to greatly modify the paroxysms in every case, and often so abated the symptoms that the cough would be of trifling violence. These results would seem to merit a trial by other practicioners, as a very simple remedy and one from which no harm can come as an experiment. The manner and strength of the dose is not given.

Decay of the Bones.—This is a terrible disease—the shrinking and ultimate decay of the bones of the human system. It is usually, if not always, a result of insufficient or improper nourishment during childhood. It is a disease which, when it has once attacked the system, cannot be eradicated by any diet or medicine that may subsequently be taken. Unfamiliar as this disease is, it is so common in London and some other portions of England that the frequent cases exposed at the clinics attract no special attention. It is almost unknown in America.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Oct. 2: The controversy over water between the Lincoln and Mahoney managements continues, notwithstanding the decision of the court last week modifying the injunction so as to enable the Mahoney to use surplus water nine hours out of every twenty-four. The Mahoney people are not satisfied with the arrangement, as they claim that after a test the amount of water is inadequate.

Inyo.

RICH ORE.—Inyo *Independent*, Oct. 4: A few men at work at the Kearsarge mine are taking out some rich ore. Twenty sacks brought down to the little mill last Wednesday were filled with ore worth 50 cents per pound. Samples of this ore assayed in San Francisco contained $1,250 per ton. A run of ore, made at the mill some days ago, yielded very large returns.

Mariposa.

PROSPECTING.—Mariposa *Gazette*, Oct. 3: The firm of H. Ward & Co., of which Capt. H. H. Todd of Alameda is a member, are prospecting mines in the vicinity of Ferguson's Mountain View Hotel, of which hotel Jimmy Ferguson is the proprietor. Capt. Todd was in town on Thursday and called to see us. The company are expending considerable labor and money in search of something permanent to justify a greater outlay in mining. They have sunk shafts and run several hundred ft of tunnels and cross-cuts, and have cut and uncovered several veins of quartz, some of which have shown just enough of the precious metal to incite suspicion that there must be a rich pocket just a little farther along, and of course they went for it, and are in search of it yet. While they have been prospecting ores from several localities, they have piled up some 50 to 60 tons which is estimated by the men, who have had the handling of it, to be worth $60 a ton. But the Captain thinks it will, no doubt, pay $15 a ton, and it might yield $20. What the company want in order to be satisfied for their labor and money expended is to find a vein of gold-bearing quartz of sufficient extent, that will yield $8 a ton, and then they will build a mill and create a property that will be a permanent institution. There is quite a large district of mines extending from Ferguson's to and including Bear creek and the mines on Sweetwater. At the latter place there is already considerable mining being done by the Grove's and Ferguson Companies, which enterprises, as yet, are comparatively new.

Nevada.

MORE GOOD ORE.—*Tidings*, Oct. 4: For several days past the rock coming from the Hartery mine has been very rich, but some pieces were brought to town on Thursday evening that fairly outshone almost any specimen ore we most ever saw. The pieces are on exhibition at Lontzenheiser's drug store. On Friday afternoon some very fine rock was brought up from the J. W. mine, or the Horse Shoe, as we believe it is to be called. There is every reason to believe that the Horse Shoe will be a No. 1 mine. The rock is at Berg's jewelry store.

GOOD MINING PROSPECTS.—Grass Valley *Union*, Oct. 3: The quartz mining situation in this district is improving, as prospecting operations during the summer have been unusually encouraging. The Peabody mine, which has been prospected more or less for several years, is now turning out all the time; lately paid a dividend, and promises to be a reliable mine. The New York Hill, which has not been looking well for a long time, is making improvement, giving encouragement for the future. The Hartley has recently turned out some remarkable rich ore, and those who know say this is only the beginning of the opening up of a rich chute. The Johnson Williams claim, as it is generally called, has turned out some very handsome rock within a few days, coming from the depth of 70 ft. The ledge is not large but the rocks show well in free gold and good sulphurets. The Oakland claim which is near by, on the opposite side of Wolf creek, which is being worked under lease by Thomas Cracklin, is turning out rock that will go $100 per load. There are also several other operations that are looking very well, among which may be named the Roche, formerly the Alpha. The North Star is being re-established by the building of large and permanent works, and in the course of a few months will be worked on a large scale, as there is plenty of virgin ground to open, and there is yet much quartz to be taken out of the old stopes down to the 1300 level. There continue to be rumors that the old Allison ranch is to be started up at no distant day, and there are millions in it yet, all of the old miners of the district believe. The Slate Ledge mine at Forest Springs is a regular producer, and understood to be doing well. At the Maryland mine the work of sinking the shaft is going on steadily, in the expectation of opening up on the same vein upon which the Idaho Co. has so long and so successfully operated. The Magenta Co. has been engaged during the summer in driving a long drain tunnel, with a view to control the surface water which heretofore has been troublesome. The shaft on this mine is down 400 ft., and the prospects have been encouraging. It adjoins the Empire on the northwest. The last named mine is running with a large force, and is paying handsomely all the time. The Idaho, the great mine of the district and of the State, shows no signs of giving out; is working on an extensive scale; paying large dividends every month; and no one pretends to place a limit upon the paying life of the mine; and its use of water-power, which makes a saving of from $25,000 to $30,000 per annum over the former use of steam, is an encouragment to the general introduction of water-power into the district to run mining machinery, which will be attended with the most important results as a factor in reducing the cost of mining, increasing the profits, and stimulating mining activity and prosperity.

A LUCKY MAN.—Nevada *Transcript*, Oct. 2: About six months ago John Hussey purchased a half interest in the Hussey mine at Willow Valley for $3,500 in cash and $3,500 to be paid out of the profits of the mine. Up to this the work of developing the mine has been going on, and about 80 tons of rock has been taken out. Last week Michael Hussey (no relation to John), the owner of the other half of the mine, offered John $14,000 in gold coin for the interest back again, thus giving him a clear profit of $7,000. In time many more as good mines will be developed in the Willow Valley district, as that section contains one vast network of quartz ledges.

A PROSPECTING SYNDICATE.—Some of the miners employed at the Idaho have formed a syndicate and sent two experienced gold hunters to Washington township to find and locate ledges there for them. The boys pay so much a month apiece towards the grub-stake for the prospectors, and the chances are first-rate that their investment will in time bring them big returns. Washington township has some of the best quartz deposits in the county, and the field is comparatively unexplored as yet, so far as they are concerned, for most of the mining up there till within a year or so has been in the gravel line.

MINING SITUATION.—*Tidings*, Oct. 2: For the past eight months there has been a great deal done in the way of prospecting in the Grass Valley mining district, and we are very glad to note that many of the prospects give most flattering indications that soon our hills will bristle with new buildings in the shape of hoisting works and mills erected over mines whose wealth has not, as yet, begun to be touched. "I don't recollect of ever seeing things look so promising in the mining line as they do at present," is an expression that may be heard on all sides, and it is true in every respect. The old mines are contributing their share of wealth to the world, and look no more like being worked out now than they did ten years ago, and are paying as well, if not better, than they ever have done. The Idaho will, in a day or two, declare its 181st dividend, and it will not be of a small amount. The Empire is working night and day, keeping their 20 stamps and their four Triumph concentrators constantly employed. There is plenty of ore in the mine and it is of the very best quality. There are many years of prosperity left for that famous old mine. The shaft is being put down all the time, and is down now to a depth of over 1,500 ft on an incline, with pay ore coming from five levels. The Imperial mine, on Deer creek, is looking better than it ever has, and promises to be a good-paying mine, and that, too, in the near future. The shaft is now down 280 ft and has two drifts running from it east and west. The drifts are in 100 ft each. In about a week a crushing will be made of ore from the east drift, and as the ledge there looks extra good, the crushing is expected to turn out big. The ledge at the Imperial is over four ft thick, and the mine can be very cheaply worked. The Peabody Company are very jubilant over the results of the past six weeks. They now have 1,200 ft of drifts open and are taking out pay ore from three separate ledges. The three ledges combined would make a ledge 13 inches in thickness. The company are now having 30 loads of their ore put through the Omaha mill and the yield is expected to be very large. The New York Hill mine is looking much better than it has been, and gives encouragement of being a good mine. A great deal of work has been done in this mine during the past years and the mine has paid a number of dividends, but in the past four or six months two small assessments have been levied on the capital stock, but the owners now think the mine will very soon turn into a regular dividend payer. Several days since we made mention of the strike of rich ore in the Hartery. The mine has been leased for a time by Jas. Bays & Co., and the boys say they are not at all sorry that they have leased it. The Lone Tree mine, near the Hartery, is being worked by some tributers. The ledge in this mine is about 2½ ft in thickness and much of the ore shows free gold, in fact the free gold, which can always be seen in the ore, gives encouragement for prospecting. As high as $30 per pan has been taken from the decomposed quartz and dirt around the regular ledge. The company expect to have the mine in good shape by spring. The J. W. (Johnson Williams) ledge, which has had a company of prospectors on it for the past month, is now giving out extraordinary encouragement to its owners, and every day rock is being brought to town that abounds in free gold and "black jack." J. J. Dorsey, W. K. Spencer, D. B. Marwick, A. Berg, Wm. Pool, Thos. Cracklin and others have recently incorporated a company for working this mine. At the bottom of the shaft there is a well-defined ledge of beautiful gold-bearing quartz, and it is estimated that it will mill at least $100 per load. Among the richest developments, there is one of exceeding importance—that of the Old William Penn mine, now called the Crown Point. It has been many years since a pick has disturbed the ground in this mine, yet everyone knows that the very richest kind of ore has come out of it. Mons. Gauthier has had such faith in the mine, that single-handed and alone he has erected a water-wheel and pump over the shaft, and has the mine pumped out to the depth of 160 ft. A drift has been run northwest from this shaft on ledge matter. There are four ft of this matter between the walls, and the walls are as smooth as though they had been polished by hand. All of the rock coming out will be hauled to the mill for crushing, for it will pay. Much of the quartz shows very fine gold and abounds in sulphurets and lead. As the drift is being pushed forward the ledge becomes more solid in character, and is of better quality than the ledge in any of the drifts. The miners working in this mine have all the faith imaginable in its success, so much so indeed that they have taken the drift on shares. The Maryland Company are actively at work, their new pumping machinery being completed. This mine joins the Idaho, and the pay chute of the latter is pitching into the Maryland ground. S. P. Dorsey is the principal owner of the Maryland, and the large owners of the Idaho have heavy interests in the Maryland also. The Magenta Company now have their drain tunnel finished and as soon as W. B. Bourn returns from the East it will be decided as to the manner of working the ledge. All is well at the North Star mine, everybody around it being as busy as bees and the work being rapidly rushed to completion. It will be but a short time before steam will be started at the North Star. The Slate Range (Perrin's) is being constantly worked and is turning out pay ore.

Placer.

A RICH MINE.—*Herald*, Oct. 2: Last Monday we visited the mine near the Chinese graveyard about a mile north of Auburn, owned and worked by Holden & Smith. It is now about a year since they struck pay in this locality, and continued development has resulted simply in increasing their prospects. They have the pay in three separate shafts, but have not yet found where the stringers come together and there they anticipate the biggest results. How much money they have already taken out we do not know, but they have certainly a wonderfully rich find. The rock fairly sparkles with gold and the clay in the seams is full of it. On Monday they stripped and took out some four or five pans which, at a low estimate, would go $50 to the pan. There has been little noise made about this mine, but it is certainly one of the biggest finds ever made in this part of the country.

San Bernardino.

CALICO DISTRICT.—*Print*, Oct. 4: One of the chloriders on the Blackfoot mine recently struck a rich pocket of ore containing a ton and a half that netted him $2,200. We were informed that ore that returned about $5,000 was taken out of the old incline made by Kaufman, the former lessee, but which was abandoned because he thought there was no more ore left in the mine that would pay. One hundred tons of ore from the Humbug mine was hauled a few days ago to the Alhambra mill at Hawley's to be crushed. Work is still progressing in this mine, and an immense body of ore is still in sight. The shaft on the Occidental mine is down about 60 ft and is penetrating a rich body of ore. Robt. Anderson and John Ackerman have bought a half interest in the Jesse Tay mine adjoining the Sue, and an entire claim adjoining the former. They have been taking out sufficient ore from this latter claim to repay them for the amount paid for the same. They expect to strike a rich body of ore on the Jesse Tay, as the indications are fine. The Josephine mine is shipping ore to the mill. They are down about 60 ft and drifting into a body of ore that assays high.

SUE MINE.—A very rich vein of ore was recently struck on the north end of the Sue mine. Several weeks ago Chris Kurtz, of San Bernardino, one of the owners, came up to examine the mine. Mr. Kurtz immediately set some men to work, who have been running in a cut to a depth of about 12 ft, and are opening up a fine body of ore that assays from $250 to $1,000 to the ton, and will no doubt mill $200 or $300 to the ton. Several miners who had seen the opening declare it the finest showing they had seen for many a day. The ore contains a great deal of black metal and is uniform in richness throughout the pay streak in the ledge. In another part of the mine a rich spot has been discovered by O. G. Leach, the superintendent. The indications are that rich developments will also be made at this point. The recent rich strikes in this mine have created considerable interest in the camp. Work is progressing on the Snow Bird with most satisfactory results. Considerable ore in sight. Mrs. Townsend has several men engaged in developing the Golconda mine, which improves as they go down. The incline shaft is down to a depth of 60 ft and has opened a body of almost solid ore about 15 ft in width. Three ft of this consists of black ore. Samples across the ledge assayed an average of $56 to the ton; some of the assays went as high as $5,000 to the ton.

Sierra.

BALD MT. EXTENSION.—Mountain *Messenger*, Oct. 2: The Extension Company has completed the drift from the top of the chute, and are taking out gravel from the new ground. The propriety of raising an incline to work this ground expeditiously and economically, is now being gravely considered. If built, this incline will be all in lava, and will be so constructed that a train of eight loaded cars can be lowered at once, and a similar number of empty cars drawn to the top by the descending ones.

PORT WINE.—This old-time mining camp yields a large gold revenue to the national treasury. O. Liberty's mine has done very well this season, considering the small amount of available water. Work has been resumed in the Queen City mines. Timbers are being hauled. Riffle Gold Mining Co., Grass Flat, have their tunnel 800 ft in bedrock. But little work was done this Summer. The noted Pioneer claim is within 100 ft of the Riffle line. By next spring the Pioneer Co. will be up to the line. Watkin and Wm. Prosser, of Port Wine, own most of the stock in these diggings. The Mountain Boy Co., Bunker Hill, near Port Wine, are running a tunnel in blasting rock for a back lead, extension of the Port Wine channel, so rich in early days. The tunnel is now in 100 ft. Two shifts have been put on, and the work will be pushed vigorously. The Prosser Bros. own the larger part of this valuable mining ground. Pioneer Co., Grass Flat, has not done as well this year, with only a profit of $8,000. Total gross yield of mine last four years, $213,000. A tunnel is being run from both ends of the claim for extension of pay channel.

ST. LOUIS.—All the miners have done well hereabout this year. Morgan, Donahue & Cox's diggings yielded handsomely, far beyond the expectations of their fortunate owners. Caledonia claim, Cedar Grove, is still being worked. The main tunnel will be run 3,000 ft back into the ridge where undoubtedly is the extension of the Grass Flat lead.

Siskiyou.

DOWN THE KLAMATH.—In company with several gentlemen, we left the city Saturday to visit the Black Hills mining district. An hour's ride brought us to the Spangler claim, at the mouth of Humbug, where we found a number of men busily at work. The claim is said to be paying handsomely, and from the appearance of the dirt we should judge that it is a veritable bonanza. The drive to Virginia Bar, or Honolulu, was uneventful. We passed many claims that were in operation. Honolulu is somewhat scattered, but is very nicely located and is possessed of considerable life, although the mines are not paying as well as they have in the past. After a night's rest our party arose in good spirits and we departed for the Big Joe claim, some three miles down the river. On our way down we took in the Centennial claim. To one who has never seen river mining it would be hard to form an idea of the great expense attached to opening and operating a river claim. Cribs, dams, derricks and wheels, all indispensable, aggregate a cost that would intimidate most any ordinary man. The Centennial is well equipped, and under its present excellent management will undoubtedly pay big. The next claim down the river is known as the Empire Bar. We are sorry to state that it only pays running expenses but we hope to hear of the owners making a big clean-up before the season is over. The China claim below may be paying, or may be not. Any information you can get from Chinamen concerning their mines you can put in your eye. Arriving at the Fort Jones claim we found a large force at work, and were informed by Chas. Parrott, the Supt., that the mine was paying well, although they are only working surface at present. A mile and a half walk brought us to Joe Cora's claim, which is not paying as large as it should by any means, for if there is any one deserving of success it is Joe Cora. He has expended a large amount of money in the enterprise in the past three seasons. He is working eight men at present, but it being Sunday the claim was idle. Before crossing the ferry we viewed the famous Kanaka claim, which has yielded so largely in its time. It is being energetically worked this season with splendid success. The Freshour claim is in operation, but we did not learn whether it was paying or not. Smith, Johnson & Mann were at work enlarging one of their wheels, the river being so low that the water did not reach the paddles. Arriving at Wm. McConnell's claim we were shown all the important features of that justly celebrated mine, not the least being the electric light plant. Mr. McConnell is running two derricks, and is getting rich about as rapidly as any man in the county. He is working large forces, and most of the time superintends the claim personally. His mine is the richest and most extensive on the river, and his mining machinery is unsurpassed by any in Northern California.

NEVADA.

Washoe District.

OPHIR.—Virginia *Enterprise*, Oct. 4: A considerable amount of ore is still being extracted from the fillings of the old drifts on the 250 level, which ore is being sent to the mills. The west drift on the 500 level is being advanced at the rate of about 70 ft per week, and the south drift on the 1500 level at the rate of over 60 ft per week.

HALE AND NORCROSS.—The north drift on the 2800 level is still being pushed forward in the direction of the Savage south line. The material has changed somewhat, but still shows a good deal of quartz. Of late signs of water have been increasing and it is necessary to use caution in advancing the drift. Rapid progress is making in the incline below the 2800 level. It is cutting the east side of the vein as it goes down, the dip of which pretty nearly corresponds with the angle at which the winze is being sunk. Last week they extracted from the 200 level and shipped to the Eureka mill, Carson river, 594 tons of ore and received from said mill bullion to the value of $7,723.06.

BENTON.—The north drift on the 2150 level is being driven forward for the vein as fast as possible. It is occasionally necessary to stop for a short time and allow the water to run down.

ALTA.—The main east drift on the 2150 level is being advanced as rapidly as can be done under the circumstances. The rock does not blast well—breaking short—and at times a good deal of water is tapped when it is necessary to halt for a time until the flow has decreased. They have now passed the point where it was expected that the most water would be found. All this water doubtless comes from the ore vein which they expect to soon reach.

BEST AND BELCHER.—The north drift on the 825 level is in vein porphyry, which has been quite hard, though good headway is being made. There is no water in this ground. On the 2500 level the west cross-cut is cutting through quartz, clay and porphyry. The quartz is of fair appearance, but carries very little metal. The cross-cut will be carried ahead until an undoubted west wall is reached.

UNION CONSOLIDATED.—On the 3200 level the joint Ophir, Mexican and Sierra Nevada winze has been sunk to a sufficient depth below the 3300 level for a sump. The work now in order is the cutting out of a station at the 3300 level and the running of a cross-cut to the westward. Already they are at work upon the station and are making good progress, though the rock does not blast out very well.

SAVAGE.—The joint Norcross drift on the 2800 level is making about 30 ft per week. The ground into which the drift is being advanced is becoming somewhat wet, but no very large flow of water is anticipated. The quartz encountered is of a promising appearance.

ALPHA.—The upraise is now about at the 500 level. Here a station will be made, and the large body of quartz they have been following from the 400 level thoroughly explored. This quartz yields very encouraging assays. Cross-cuts are still being run in this same body of quartz on the 600 level.

ANDES.—The north drift from the winze shows plenty of quartz and occasional bunches of ore are found. The main north drift is in quartz of a fine appearance. Cross-cutting is now in order. The quartz yields promising assays.

COMBINATION SHAFT.—The shaft has reached the 3000 level, and is now being sunk below that point to a depth sufficient for a sump. Next in order will be the cutting out of a station at the 3000 level in which to place the new hydraulic pump.

YELLOW JACKET.—The old upper levels are still yielding a considerable amount of low-grade ore, and this yield may now gradually be increased with the increased volume of water in the Carson river.

CON. VIRGINIA AND CALIFORNIA.—The northwest drift on the 1700 level is making good headway, and is in material of a very favorable appearance. Cross-cutting from this drift will soon be in order.

BELCHER.—As the volume of water in the Carson river increases the amount of ore extracted is also increased. A considerable amount of exploring work is being done.

SCORPION.—The north drift on the 500 level is being pushed forward as rapidly as possible. It is in vein porphyry, with some streaks of quartz and seams of clay.

CROWN POINT.—The amount of ore extracted is gradually being increased as the rise of water in the Carson river allows of the running of additional stamps.

SUTRO TUNNEL.—*Enterprise* Oct. 4: Following is the report of progress and details of work in the Sutro tunnel during the month of September: Main tunnel—Since last report the repairmen have retimbered and made sundry repairs at the follow-

ing points: Between the 100 and 2,840 have removed 128 posts and 68 caps of old timber, squared ground and put in place 173 posts and 70 caps of new timber, relagged and braced old and new sets, repaired guard planking along the side of the track, cleaned out drain boxes and cleaned up and removed debris. Between the 11,300 and 11,400 have placed 124 new cross and 5 side plank on drain boxes. Between the 18,200 and 10,400 have relagged old sets and cleaned up debris. Retimbering has been finished at the following points: 1,200 1,400, 1,-900, 2,600 and 2,300. At the 1,200, begins 2 ft 9 inches east and extends in the same direction 75 ft 9 inches; at the 1,400, extends east 42 ft 9 inches and west 6 ft 2 inches; at the 1,900, extends west 88 ft 6 inches and east 61 ft 6 inches; at the 1,000, begins 20 ft 8 inches west and extends east 10 ft 2 inches; at the 2,300, begins 10 ft 6 inches west and extends east 40 ft 4 inches.

Lewis District.

NEW MILL.—*Messenger*, Oct. 2: George W. Bothwell arrived at Battle mountain, Monday, from San Francisco, with the machinery for a new mill that is going to build for the Pittsburg Con. M. Co., at Lewis. He expects to begin work immediately, and will soon have the mill up and in running order. Cardwell and Morgan have made arrangements to run the mill all winter on ore from their mine, of which there is an abundance in sight. We expect to record numerous bullion shipments from Lewis this fall and winter.

Osceola District.

WATER.—Cor. Pioche *Record*, Oct. 2: Jim Mathewson, just over from Osceola, says that it is a fact as to Bishop Black of Deseret, Utah, having secured a contract from the Godbe Placer Mining Co. to bring water to the digging through a large ditch, the distance being some 12 miles. The Bishop, with a large force of Mormons, are expected every day; also Mr. Eastmond, who will superintend the erection of whatever fluming is required on the ditch. I have been informed, by good authority, that J. C. Turner, Superintendent of the Osceola Mining Co., made a proposition not long since to the company he represents as to purchasing their mill, and that his offer had been accepted. Our informant also stated that Mr. Turner was negotiating with Capt. Akie and Boone Tilford with a view toward working their mines. As Mr. Turner is a practical mining and mill man, and as Messrs. Akie and Tilford have good mines, and the mill as fine as there is in the State, Osceola may boom yet.

Sacramento District.

MILL CITY REDUCTION WORKS.—*Silver State*, Oct. 2: The new reduction works built by Gould & O'Donnel at Mill City made a run on ore from the Humboldt Queen mine, in Sacramento district, with very satisfactory results. M. S. Thompson, from whom this information was derived, says that the works had to shut down in consequence of the scarcity of water for amalgamating purposes, until a new well, which is being sunk, is completed.

Sherman District.

AT WORK.—Reno *Journal*, Oct. 3: Jim Burke came in from Sherman district yesterday. He has not yet got his hoisting works up, but has a force of men at work at it. He hopes to get everything in shape before the weather gets cold, so that work may be continued uninterruptedly all winter. Out of curiosity the other day he had an assay made of a 3-ft streak of talcose substance found about 30 ft below the surface, and to his amazement got a return of over $500 in silver. He will now run a drift in on this streak and see what it amounts to.

Silverado District.

RUNNING SMOOTHLY.—Eureka *Sentinel*, Oct. 2: John Killen is in from Silverado and reports that camp as running smoothly. He has a lease of all the Queen mine above the 100 level, and has lately struck a small seam of rich ore which grows large as development work progresses. This is in a drift run in virgin ground west of the shaft. The Jones brothers have also struck high grade ore on the 160 level, and had taken out from the find two sacks of ore just as Killen left.

Taylor District.

A BRISK CAMP.—Cor. Eureka *Sentinel*, Oct. 3: Taylor, however, is quite a brisk little place, and one of the healthiest mining camps in the West. Miners receive $4 per day, and have to contend with no lead or foul air. Both the mines are paying handsome dividends, especially the Monitor, which, beyond doubt, is the best paying property in the State. The Argus mill, which has been undergoing repairs, started up on the 20th, and Supt. Carothers expects to make a three months' run before shutting down again. As I write a large body of passably fair ore has been tapped in the Neptune, one of the Argus group of mines. The property joins the Monitor ground on the west, and the strike referred to proves conclusively that there is a large mineral belt running parallel with the camp, and which is liable to be as rich as the Monitor.

ARIZONA.

NOTES.—Prescott *Courier*, Oct. 3: Mr. Van Name, of Big Bug district, is here and tells us that Mr. Schofield is the gentleman who is going to run the new gold mill and concentrators, which S. J. Egbert will shortly put in place. Supt. Eaman will see that the Tuscumbia mill is started, Tuesday next, on ore from the Lane mine, of which there are nearly 200 tons ready for crushing. A. J. Moore, just from Jerome, tells us that the United Verde Co.'s furnace is making a great deal of copper silver bullion and that another furnace will soon be set up and run. Mr. Moore says the company is one of the best in the country. Superintendent, bosses, all are very easy with employes. Barney Martin reports progress in Antelope and Weaver districts. Mexican placer miners continue to make fair wages, by washing the gravel. R. W. C. Merrington says that his Queen Mab mine is opening up well. Chicago mine, Groom Creek district, is being opened by shafts. Lessees of the Kimball mine, Lynx creek, are stoping out ore and working concentrates. Considerable ore is being shipped from Dosoris and Turkey Creek district.

COLORADO.

SUMMIT.—Red Mountain *Miner*, Oct. 4: The Summit is owned by J. P. Johnson, J. G. Gray and J. Burdette. Is situated in Dry gulch, near the divide between it and Humboldt. Is developed by a 65 ft cross-cut tunnel; a 20 ft drift on the lead and a 30 ft shaft. In the latter at a depth of 22 ft, a 10-inch streak of very pretty galena and copper ore was encountered, and in the 8 ft that it has been followed has widened out to 18 inches. Character of ore where first encountered was a carbonate with numerous boulders of galena, assays of which gave 34 ounces silver with a fair percentage of lead. Nearly all the Dry gulch properties have carbonate deposits near the surface, and without an exception as yet, as depth is gained, they run into solid ore. Caledonia shaft when filled by hand slide was done some 20 ft. Owners concluded that the better plan would be to abandon work of cleaning it out and to start a cross-cut that would enable them to tap ore body at some depth. Accordingly, work was commenced at some distance below the shaft, and the tunnel is now in about 40 ft. It is thought that 45 ft of additional driving will tap mineral. Ore is worth about $50 per ton, but the body is so large that it will pay handsomely to mine it. Work on the Sailor Boy has been prosecuted steadily since May last. Workmen were driven out of lower workings recently by water, but started a drift on the large ore body that cropped out on the surface. One car-load of 140 ounce ore has already been shipped, and large quantity on dump from which daily shipments are being made. Another rich strike of high-grade mineral was made a few days since on the Yankee Girl, at a point some 12 ft above the bottom of the shaft, and designated as station No. 3. Mr. Schwarz states that the mineral is as high-grade as any yet found in the mine, and there is 6 ft of it. Tunnel on the Denver in Humbold gulch now in 75 ft. Owners think they are almost under the lead and expect to cut it at any time. Rock has been found much harder than anticipated, otherwise the tunnel would have been much farther in.

IDAHO.

THE IDAHOAN.—Wood River *Times*, Oct. 2: W. H. Nye, the well-known Boise druggist who is a fourth owner in the Idahoan mine, and mill, was in town to-day. He reports himself highly pleased with the way the mine is being worked, and says that it is looking better now than it ever did. About three months ago the owners concluded upon a change of policy. Heretofore the mine had been as if on dress parade, with huge blocks of ore in sight that they seemed afraid to touch. It looked as if they were afraid of digging it out. But about the time stated they determined to start in and try to knock the bottom out. They began taking ore out and shipping it to Kansas City. They have taken out and shipped an average of one car-load per day for over two months, and the mine looks better and better. Where the ore in the drifts has been blasted and removed, it shows up wider in the bottom, and thus justifies greater hopes for the deeper workings. The workings have, however, got so deep, that the hand windlass with which all the hoisting has been done must soon be laid aside and replaced with machinery. This will be done this fall; and Superintendent Edgington and the owners will endeavor, from this time on, to keep the Idahoan where she should be, to-wit: in the very front rank of Wood River properties.

THE CAMAS NO. 2 MILL.—Wood River *Times*, Oct. 2: Last week the timbers for the mill which is to be erected on Big Camas No. 2 mine, up Croy gulch, about 10 miles from Hailey, were ordered. This mine was sold a few months ago to capitalists of St. Joe, Missouri, for $10,000 cash. The ledge is said to be over 100 ft in width, and the ore assays $40 in gold per ton.

A PAYING PLACER CLAIM.—J. B. Hunt, a prospector who has been down on Snake river for a little over a year, is making quite a success of his placer claim, earning an average of $50 per day, with two men, or about $17 per man per day. He is running but one machine—a cheap grizzly with burlap sluices, and cleans up between $140 and $175 worth of gold every three days. In June he cleaned up $1,400, in July $1,500, in August $1,200, and this month he has already cleaned up over $1,200. Mr. Hunt will have two other machines in operation in about a month, and his clean-ups thereafter will doubtless aggregate $3,000 per month. Mr. Hunt's claim is near Salmon Falls.

THE EAST FORK OF WOOD RIVER.—Ed. Brown came in from the East fork, yesterday, and went out to Lost river to-day to work on the copper smelter being erected there. He reports striking a 5-ft iron ledge showing six inches of galena, at the head of the East fork of Wood river, which he located for himself and Q. A. French, of this city. There were over 200 men working along the East fork in July and August, and over 100 men are still steadily employed there. Mr. Brown thinks very highly of the East fork, and believes that in time it will be equal to Bullion as an ore and bullion producer.

MINERAL NOTES.—Cor. Idaho *World*, Oct. 3: The camp is looking up and the boys all in good cheer. Development on the Black Hawk mine is moving steadily on, by Duffy, Kelly & Co. The Black Sam mine is showing up splendidly, and work on the same being in progress. The Daniel Boone, that has been lying still all summer, has again opened her batteries, and a general cannonading can be heard under the supervision of Peck & Giger. Messrs. Campbell & Stein are piling out rich ore for milling on the dumps of the Wide Awake and Muldoon. Keatts Brothers are packing down high-grade ores from the S. G. Hull mine to be worked by Stein & Co., which we know will be a success. The mill under the supervision of Mr. Stein, has been a success thus far, and as he is now prepared for working under a different system we have all reason to believe that it will prove a great benefit to the camp, as he aims to put it to its full capacity.

MONTANA.

THE BEST ROAD TO THE NEW MINES.—Helena *Independent*, Oct. 2: Mr. W. S. Wetzel, of Benton, arrived in the city yesterday. For the benefit of those who have been misgnided, an *Independent* reported immediately sought Mr. Wetzel to learn some facts concerning the gold excitement of the Little Rockies. He reports great excitement in all the northern country over the mining discoveries. The diggings are said to be very rich and a general stampede has set in for them from Benton and vicinity. The mines are situated about 130 miles north of Benton and the best road to them lies through that city. Mr. Wetzel says that there is a good wagon road the entire distance, the larger portion of it being the Benton and Fort Assinaboine stage line.

LITTLE ROCKIES.—*Inter-Mountain*, Oct. 2: News from the Little Rockies is that Alder gulch continues good and there are probably lots of other good paying gulches in the vicinity, if the pilgrims who are crowding into the mines would only look for them instead of begging for grub among the claim owners who have no more than enough for themselves. All the miners now taking out gold are fairly well supplied with provisions, but they are not prepared to supply the whole country, or even their "host of friends," and it is therefore advisable for all persons going to the mines to take with them a full outfit of provisions and tools, or else remain at home.

ENCOURAGING REPORTS.—Butte *Inter-Mountain*, Oct. 4: The tendency of the past few months has been to the development of an unprecedentedly large number of new properties which have hitherto been undeveloped—claims upon which the owners have done simply the assessment work necessary to the obtainment of a patent. Large numbers of these hitherto idle claims are now being worked by men of small capital but indomitable energy, and the result is seen in the increased bank accounts of the workers, an enlarged bullion output for the camp and a decided improvement in the sales of our merchants. This happy state of affairs is due largely to the improved milling facilities that now obtain over the methods formerly in use, and the improvement is destined to grow in proportions until each now undeveloped claim will add its little quota to the bullion proceeds and to the amount of business transacted in our midst. The general prosperity of the community might be considerably increased if many of the mining men of experience and known ability in the camp would avail themselves of the numerous opportunities offered of leasing valuable prospects instead of, Micawber-like, "waiting for something to turn up."

LEXINGTON.—At the Lexington, cross-cutting south for the vein on the 650-ft level has been going on for some time past, and from the flow of the water in the level, the proximity of the vein is assured, it being thought that it will be encountered to-day. From the other levels ore of the usual grade is being hoisted out. At the mill everything is running along smoothly, the whole property, in fact, being in a most satisfactory condition. President Renevy, in company with Superintendent Wartenweiler, has given the plant and mine a thorough inspection, and it is altogether likely that improvements of an extended character may be made.

ALICE.—The grade for the new Cornish pump is about completed, and a large force of men are now at work on the pit for the mammoth machine. Some idea of its magnitude may be formed from the dimensions of this pit, it being 85 ft long, 18 ft wide and 20 ft deep. The bob pit at the 300-ft station is being pushed to completion and will be finished in about two weeks. While excavating the pit above mentioned a very nice body of ore was uncovered, assaying high in value. On the 300-ft level of the Alice a body of very rich ore, literally plastered over with silver, is being stoped out. Both mills have of late been doing very satisfactory work, and the tonnage crushed last month was the largest accomplished since the starting up of the machinery, it aggregating the grand total of 3,032 tons, which, allowing for a day's stoppage, averages considerably over a ton to the stamp every 24 hours.

BELL.—At the Bell operations are now being prosecuted on the 500 ft level and shipments uninterruptedly made to the smelter.

RISING STAR.—Sinking for the 400 ft level is actively progressing, and it is thought that by Monday next the vein will have been encountered. On the 200 ft cross-cut they have struck the vein, showing a very large body of satisfactory ore.

HECLA.—*Inter-Mountain*, Oct. 6: The erection of the third furnace at the Hecla Company's smelter is actively progressing under the personal supervision of Mr. Knippenburg. The daily smelting capacity will thus soon be increased to 60 tons. The Hecla Company now controls a group of the best mines in Montana, and has not missed a monthly dividend since '81. No mining enterprise in the country is conducted on a more legitimate and business-like basis than the Hecla.

NEW MEXICO.

GOLD HILL DISTRICT.—Silver City *Enterprise*, Oct. 2: During the past three weeks rumors of a new find have repeatedly come to our hearing, but not until Sunday last were we informed of the exact location. On Saturday last Robert Black and T. E. Parks returned from the western portion of the Burro mountains and gave us the particulars of the discovery, which they with others are interested in. Accompanied by Jesse Davis and David Egelston the above mentioned gentlemen went on a prospecting tour about the 10th of September in the Burros. They prospected the country to the west of Soldiers' Farewell pretty thoroughly and fonud some carbonate ore, samples of which they brought to town and had assays made which give returns of 43 ounces silver and a high percentage of lead. They determined to return and work the carbonate property, and for that purpose they left here with a large supply of provisions and tools. On their way to their find they came upon two prospectors named Winter and Johns, both well known here, and learned that another man was also in the vicinity prospecting. They inquired if any mineral had been discovered, and on receiving a very evasive answer, concluded to prospect for themselves at that particular point which is several miles from the place of their first discovery. They were not long in convincing themselves that mineral of good grade abounded in the vicinity, but of an entirely different character from that found by them on their previous visit. The formation in which the mineral was found is synite and granite, the leads cropping out largely in many places, and to their surprise carried more gold than silver. In many places free gold was found. Both parties were employed constantly for several days, prospecting and staking out claims until they were satisfied that they had a sufficiency of ground and mineral, when they proceeded to carefully sample the ledges of their first claims. Care was taken not to select pieces in which gold could be seen for assaying. Many rich specimen pieces were selected and brought into town, and created a stampede of prospectors for that section when shown here. There is said to be about 100 men, prospecting in the vicinity and to the east and west of there at present. The ore brought in, which is an average of the ledge, runs $57.08 in gold and silver in one assay and $51.33 in another. Our informants say that they can mine the ore and haul it to Lordsburg, a distance of 12 miles, at a very small cost. The ledges are said to be from 10 to 40 ft in width. The great draw-back to the camp at present is the scarcity of water, which has to be hauled about 10 or 12 miles. When this is overcome, look out for a boom. The discoverers met and organized a district, calling it the Gold Hill mining district. They also arranged to sink a well in the vicinity. Encouraging reports are coming in daily from the camp. Malone and Rattlesnake City are almost deserted at present. Lordsburg is afire with the fever.

UTAH.

A NEW STRIKE.—Salt Lake *Tribune*, Oct. 4 Westerly from the Read & Benson and easterly from the Sailor Jack and Carbonate mining claims, and near the south fork of Big Cottonwood, there have recently been discovered and opened some very rich and promising prospects of large veins of galena and carbonate ore. The name "Tecumseh Group" has been given to the new discovery, and it is the opinion of our informant that the six claims comprising the group will equal, if not rival, their once famous neighbors in the output of ore. For 1,000 ft on the strike, in four different openings, the ore has been exposed in width from three to eight feet, assaying from 30 to 200 ounces silver and from 30 to 60 per cent lead. The lucky owners, Messrs. Beerson, Johnson and others, are jubilant and well they may be.

PARK CITY NOTES.—Salt Lake *Tribune*, Oct. 3: The Sampson shipped last week to the sampler 26,-370 pounds of ore. The lessees of the Bonanza shipped last week 21,920 pounds of first-class ore. The Apex has shipped ore to the amount of 27,100 pounds during last week.

REVIEW.—Salt Lake *Tribune*, Oct. 3: The output of bullion from Utah for the nine months of 1884 that are gone by, including some from Idaho, and excluding all ores, was as follows as per our regular reports: January, $449,228.74; February, $364,-606.47; March, $460,366.60; April, $432,809.44; May, $343,416.15; June, $539,532.90; July, $530,978.35; August, $526,393 83; September, $522,283.49; total, $4,169,615.95. This, as we have heretofore stated, does not include the work of several large producers, which make no reports till the close of the year. For the week ending October 1st, inclusive, the receipts of ore and bullion in this city amounted to $170,112.30, of which $126,702.30 was bullion, and $43,500 ore. The week previous the receipts were $132,531.99, of which $118,341.99 was bullion and $14,290 ore. The receipts for the week from the Horn Silver were 15 cars of bullion, $45,000, bringing the total output of this mine for the year up to $1,896,-000. The product of the Ontario for the week was 52 cars of bullion, of the value of $38,996.30; making a total output this year to date, $1,279,238.20. The Crescent sent down two lots of ore during the week, valued at $8,950. Mr. Withey, down from Park City, says the Crescent tramway is now finished. The concentrating mill was up, but setting the machinery is delayed by the Cornish rolls failure to arrive. They were ordered with the other machinery, but not being carried in stock, it seems they had to be made. The mine looks better than ever, and has long been sending down 50 to 60 tons of ore per day. The Northern Chief seems to have lost its grip just as it got ready, after four years of preparation to do something. We learn that the property is attached, and we suppose because the owners refuse to "put up" any longer. With the mine well opened, lots of ore out, and a new mill, just ready to operate, it looks to spectators like a bad time to weaken. It is indeed curious how men go into a scheme like this with enthusiasm, and all their friends not in think they are being badly left, spend $100,000 may be, and then let all go to pot rather than put up another $100. At the New Emma we learn that Capt. Cullens has got up steam, and is now ready to pump out the water, if, indeed, it is not being done. We look for something in or near the bottom of this shaft, to revive the reputation of that famous property, and the camp on the head of Little Cottonwood, the pioneer mining camp of Utah. Mr. J. H. Dupaix of Minersville was up recently to get a few stamps to work ores from what is called the John Kemple mine in South Star district, about 12 miles from Milford. The location is 600 ft wide by 1,500 ft long, and has four parallel veins striking east and west, and within 150 ft of each other. They seem to be independent veins, in limestone, and so far are dry ores. Three of them are thin but very rich, in and out, 2 to 6 or 8 inches, $300 to $500 rock. The fourth is thicker, 2 or 3 ft, averaging $35 or $40. The deepest working is an incline 50 ft. Mr. Dupaix thinks he doesn't get a fair price for his ores in this market. Hence he is going to try to work it himself, on a small scale at first, increasing his plant as results may justify.

WASHINGTON.

CLE-EL-UM MINES.—Cor. Kittitas *Localizer*, Sept. 27: The Bullion M. Co. have their incline shaft now at the depth of 140 ft. Good ore continues all the way down. On account of the last snow-storm, work in the mine has been laid over until next spring. Purdy Flint has some men working assessments on the Made'eine, Black Hawk, and other property he owns in the district. B. B. Kelly and E. P. Boyles are building a cabin near the Silver Bow, in which they intend to remain this winter and prospect some copper claims they own. The ore is copper pyrites and oxides, the assay value of which is 40 or 50 per cent copper, and about $35 gold and silver per ton. The ore bodies vary from 3 to 8 ft in thickness. The owners of the Morning Glory mine have sunk an incline shaft 44 ft. The ledge at the bottom has increased to the width of 5 ft solid ore with a clay gauge on the foot wall 7 inches wide. The Morning Glory has proven to be a well defined and true fissure vein; the foundation is granite schist. There have been several other new discoveries made this season which are looked upon as valuable properties. The owner of one claim says he is not excited, but nothing less than a homestake will change the ownership of his mine. It is the intention of the miners of this district to commence early next spring to cut a good pack trail and wagon road up the Teanaway to the mines, for they are convinced they have the ore that will pay and plenty of it.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Glant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

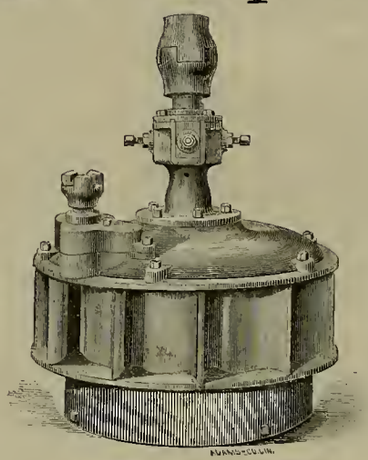
LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

ECLIPSE DOUBLE TURBINE WATER WHEEL

Points of Superiority:



FIRST.—Simplicity, being composed of the smallest possible number of parts.

SECOND.—The Wheel, Outer Case, Register Gate, and Top, each being one casting, and all the work on them being performed by machinery, and fitted to a standard gauge, secures the highest perfection in construction and operation, and the utmost strength.

THIRD.—The entire absence of rods, bolts, levers, light castings, or "traps" of any kind, securing the greatest durability, with entire immunity from derangement of parts and breakage, so common in all complicated wheels.

FOURTH.—The conical interior of the wheel, which secures perfect freedom of vent for both tiers of buckets, enabling the wheel to rid itself immediately of "dead water" without friction. This feature is entirely original with this wheel, and is found to be of very great practical importance.

FIFTH.—Its "Duplex Chute," formed by the Register Gate and outer case. The outer case moulds the current of water, delivering it in a solid body through that part of the Chute comprised in the Register Gate on to the wheel. This Chute being fixed, the direction of the current is never changed, nor its velocity checked, consequently nearly the same per cent. of power is obtained with the gates only partially drawn as when fully open.

SIXTH. A Gate thoroughly protected from vertical pressure, which, when partially closed, does not break the column of water or change its proper direction, which is easily operated, and yet shuts so tight as to prevent leakage; and the shutting of which is not likely to become obstructed or prevented by foreign substances.

SEVENTH.—The housing up of the pinion and segment for operating the gate, which entirely prevents all danger of breakage by foreign substances getting between the teeth. No other concern does or can use this improvement, which effectually does away with a source of most frequent annoyance and delay.

EIGHTH.—The amount of power it yields, together with its Simplicity, Durability and Strength, fairly entitles our wheel to the name given it, The Eclipse Turbine. In further proof of the power of this wheel, we invite a careful inspection and comparison of our tables with corresponding tables for all other similar wheels.

PREMIUMS AWARDED.

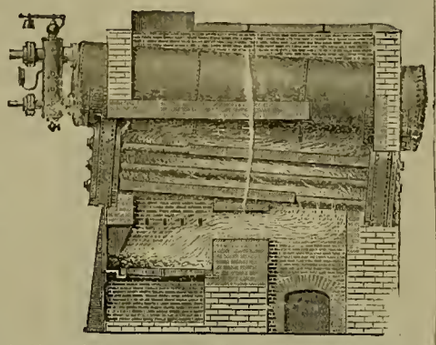
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, MO., Sept. 28, 1883

Messrs Adolphus Meier & Co. GENTLEMEN: We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER BUSCH BREWING ASS'N

OFFICE OF SUPT OF ROYAL RAILWAYS, BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 2d, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

A Great Triumph!

WON BY THE MANUFACTURERS OF THE

EUREKA CEMENT,

GOULD & HILL, Proprietors,

103 and 105 Fremont St., San Francisco.

On the 25th day of August, 1884, Judge Sabin, of the United States Court of Equity, decided the great infringement case of the Salamanda Felting Company of New York and Philadelphia vs. the EUREKA CEMENT, in favor of the EUREKA CEMENT. This decision is one of the most important that has been rendered for many years, because it gives Messrs. GOULD & HILL the unrestrained right to continue the manufacture of the BEST COVERING FOR STEAM BOILERS AND PIPES that is known to the world.

JESSOP'S BEST TOOL STEEL

In Great Variety of Sizes.

ROCK DRILL STEEL in BOND or DUTY PAID

Gold Medals Awarded at Exhibitions of Paris, 1878. and Melbourne, 1881.

JESSOP'S STEEL

Manufactory: SHEFFIELD, ENGLAND. Branch Warehouses throughout the United States and Canada.

Sheet Steel, Best Circular Saw Plates, Double Shear Steel, Die Steel, Etc.

As a SPECIALTY, we offer our BEST TOOL AND DIE STEEL, annealed soft. Also, ANNEALED DIE BLOCKS from Stock, or on importation orders at Short notice.

WILLIAM JESSOP & SONS, LIMITED,

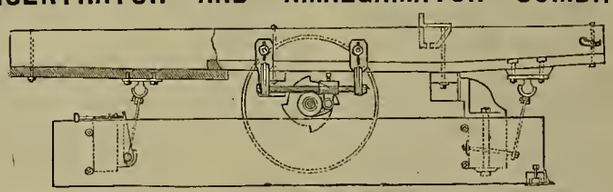
91 John Street, New York.

PARKE & LACY, Agents,

21 and 23 Fremont Street, San Francisco.

PATTEN'S

CONCENTRATOR AND AMALGAMATOR COMBINED.



This machine requires less power, less care or attention, and is less liable to get out of repair than any Concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all millmen, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

The undersigned is now located at the Ætna Iron Works, 217 to 221 Fremont street, where he is building the above machines and prepared to fill orders, and guarantee them to do all that is claimed. Weight 625 pounds; price, $300. **Estimates given and orders promptly filled for all kinds of Mining Machinery.**

Assays and practical working tests made of ores.

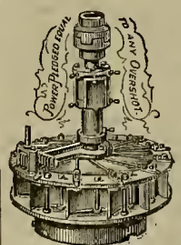
C. W. PATTEN, 217 Fremont St., San Francisco.

JAS. LEFFEL'S TURBINE WATER WHEEL,

The "Old Reliable,"

With Important Improvements, making it the

MOST PERFECT TURBINE NOW IN USE,



Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL & CO.,

Springfield, Ohio, and 110 Liberty Street, New York City

PARKE & LACY, General Agents, 21 & 23 Fremont St., S. F.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The **genuine** has stamped on every sheet "**Jenkins Standard Packing**," and is for sale by the Trade generally.

Manufactured only by

For Sale by DUNHAM, CARRIGAN & CO., San Francisco, Cal.

JENKINS BROS., 71 John St., New York.

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco

Mining Share Market.

The mining stock market shares the depression of general business, which, added to its former dullness, makes stock matters very uninteresting. Prices change very little and the volume of business is small. On the Comstock, at the north end the joint winze of the Ophir, Mexican, Sierra Nevada and Union Consolidated has reached the point to which mining men have long been looking forward. The winze is completed to a point which gives sump room below the 3300 level, and at said level a working station is at present being excavated, from which explorations will be made to the westward. This cutting across the Comstock lode at the great depth of 3,300 feet below the surface is a work which will not only interest all mining men but also all the experts and all the geologists and scientists who have ever examined the vein formation and the temperature and stratification of the country rock adjoining. Being the greatest depth attained on the American continent, if not in the whole world, this new level will naturally attract the attention of all scientific tourists passing this way.

At the Ophir they will soon be making interesting explorations on the 500 and 1500 levels. In the old bonanza mines a northwest drift is now being run on the 1750 level, which will pass through ground and drifts which will doubtless eventually connect with the explorations about to be commenced in the Ophir.

In the Best and Belcher and Gould and Curry explorations in ground not heretofore prospected, work will soon be commenced on and above the 825 level. At Gold Hill the leading companies are now able to increase their forces of men, and consequently the amount of ore extracted and milled. The Overman is now coming in among these mines with a goodly yield of low-grade ore from its old upper levels.

Bullion Shipments.

Hanauer, Sept. 30, $5,550; Wood River ore, 30, $2,550; Christy, 30, $1,795; Vienna, 30, $3,150; Horn Silver, 30, $15,000; Ontario, 30, $10,379; Vienna, Oct. 1, $3,182; Ontario, 1, $5,745; Horn Silver, 1, $6,000; Hanauer, 2, $3,750; Crescent, 2, $4,850; Horn Silver, 2, $6,000; Ontario, 3, $5,435; Day, 3, $3,861; Hanauer, 3, $3,650; Wood River ore, $4,700; Horn Silver, 3, $9,000; Ontario, 3, $5,505; Christy, 3, $3,100; Vienna, 3, $3,214; Day, 4, $4,058; Ontario, 4, $11,729; Horn Silver, 4, $9,000; Hanauer, 5. $3,850; Crescent, 5, $4,000. The bullion shipments from Butte, Montana, for two weeks ending Oct. 3rd, aggregated $275,835, by far the largest output yet achieved in the silver product by the camp in the same space of time. Paradise Valley, 4, $4,011; Barner district, Idaho, 4, $10,000; Silver City, Idaho, 4, $2,218; Grand Prize, 3, $6,500; Bodie, 2, $1,286; Bonanza King, 4, $7,970; Contention, 3, $8,201; Navajo, 6, $14,000. The banks of Salt Lake City report the receipt for the week ending October 1st, inclusive, of $126,712.3e in bullion, and $43,500.58 in ore; a total of $170,212.88.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superviser Court, Department 10, San Francisco:

HORSESHOE M. Co., Oct. 6. Capital stock, $500,000. Directors Wm. K. Spencer, J. J. Dorsey, Thomas Cracklin, David B. Marwick and Alfred Berg. This is a Grass Valley Company.

DELHI M. Co., Oct. 6. Capital stock, $1,000,000. Location, Columbia Hill, Nevada county, Cal. Trustees—Robert McMurray, Niles Searls, Edward Stafford, A. S. Bigelow and Walter S. Bigelow.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento Co.
A. C. KNOX—Nevada (State).
B. W. CROWELL—Fresno and Tulare counties.
GEO. MCDOWELL—Amador and Calaveras counties
WM. PASCOE—San Francisco.
WM. H. COOK—Los Angeles Co.
H. G. PARSONS—Montana and Utah.
G. W. INGALLS—Arizona.
D. K. BRAMBLE—Humboldt and Del Norte Co.

MINING SHAREHOLDERS' DIRECTORY.

PROGRESS IN SCIENCE.—The developments of physical science have received a wonderful impetus within the last ten years. Twenty odd years ago, according to the chief literature on opthalmology, we find very conflicting opinions entertained by many eminent physiologists regarding the pathology of the eye when accommodation was not understood nor the cardinal points of physiological dioptrics. Astigmatism of the eye is very often treated for amblyopia, amarosis, etc., while it is a mechanical defect, and can be corrected by simple or compound lenses correcting the errors of refraction. Many to this day don't comprehend the difference of refraction or accommodation. Old sight, or presbyopia, is ranked with a faulty formation, and the belief still exists in the minds of many that as a person grows older the eyes fatten. Having tested over 2,000 complicated cases of defective sight in the last three years, which I have a record of, I confidently solicit all who are troubled with painful forebodings of loss of sight and defective vision, inflammation of the eyes, to avail themselves of my professional services free of charge.

C. MULLER, Optician,
7 135 Montgomery St., near Bush St.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING SEPTEMBER 30, 1884.

305,831.—EXPLOSIVE SHELL.—J. L. Bachelder, Globe, A. T.

305,788.—OXIDIZING FURNACE—John R. Brett, Oakland, Cal.

305,902.—CHAIN PUMP—Geo. W. Derrick, Centerville, Or.

306,012.—VALVE FOR WASH BASIN TRAPS—C. W. Garland, Oakland, Cal.

305,816.—ENGINE GOVERNOR—John L. Heald, Crocket, Cal.

305,818.—DYE VAT—C. A. Hoffmann, S. F.

305,833.—MOWING MACHINE—C. W. McKelvey, Portersville, Cal.

305,846.—WORKING AURIFEROUS ARSENIDES, ETC.—E. Probert, S. F.

305,849.—TAILORS' SQUARE—S. G. Rugland, S. F.

305,852.—CHIMNEY CAP—M. Scholl, S. F.

305,857.—STRAM BOILER AND SEDIMENT COLLECTOR COMBINED—J. Spaulding, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAR COUPLING.—Thos. H. McNamee, Le moore, Tulare Co. No. 303,394. Dated Aug. 12, 1884. It consists in a draw-head, provided with a vertically moving and guided coupling pin, adapted to be raised by means of oscillating crank levers extending to the sides and held in a raised position, and tripped to effect its fall by means of a horizontally moving spring latch-plate, operated by the impact of the opposing draw-head. Connected with and operated by the coupling pin is a vertically moving spring plate, adapted to bear upon the rear end of the link and hold it in a straight position. With this coupling it is unnecessary for the brakesman to go between the cars in coupling them.

REVERSIBLE PLOW.—Alfred H. Fitch, Santa Cruz. No. 303,715. Dated August 19, 1884. This reversible plow has a peculiar construction of beam-handles and frame-work, the beam forming an axis upon which the plow standards are journaled, and about which the plows revolve when reversed; gears and a crank, or lever-arm, by which the plows may be reversed, and supporting and adjusting mechanism. The object of the construction is to obtain cheapness, lightness and strength in a reversible plow.

GRAIN SCOURER.—John C. Hunt, Chico, Butte county. No. 303,734. Dated Aug. 19, 1884. This invention relates to an apparatus for scouring or cleaning grain from foul surface matter and woody fiber, which embodies a series of rings or disks, having peripheral teeth mounted close together and parallel upon a horizontal rotary shaft with an inclosing case, through which a blast of air is drawn by a suction-fan, and through which the grain also passes by a spiral feed. The case is perforated, and an outer case indorses it at a short distance so as to form a passage between the two for the air current which may also pass into the inner cylinder through the perforators. Gates or valves control the air current, and suitable discharge openings are made for the cleaned grain and the reflex.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufacture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.
2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough oil to prove what we say. Our oil has now been adopted as

Cheaper, More Economical, and More Serviceable than any other Oil

On the Central and Southern Pacific Railroads, the Northern Pacific, South Pacific Coast, and North Pacific Coast Railroads, the Oregon Railway and Navigation Co., Pacific Coast Steamship Co., and all the prominent Iron Works, Saw-mills, etc., on the Coast and Puget Sound. ADDRESS:

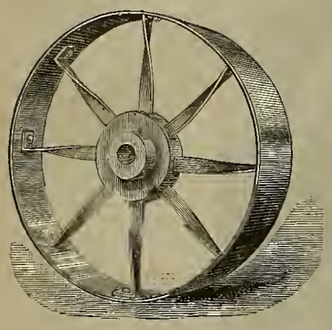
Iron and Machine Works.

MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (LIMITED), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq. Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE
Cheapest and Most Effective Machine
OF THE KIND NOW IN USE.
Adapted to All Grades and Classes of Ores

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coarser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

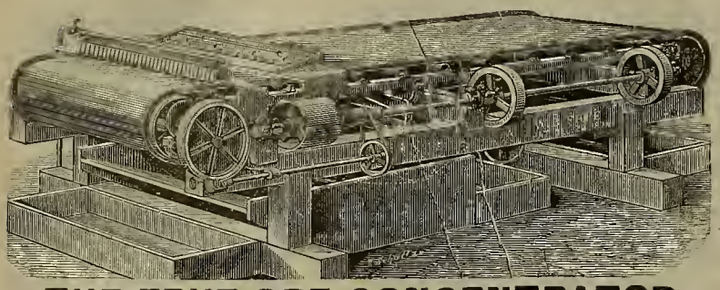
200 to 10,000 Gallons a Minute.

SAN FRANCISCO TOOL COMPANY, 11 Stevenson Street, S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

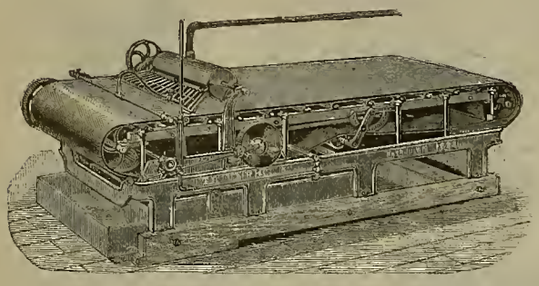
The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the **"Triumph" Ore Concentrators** and the same number of **"Frue" Vanning Machines**, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000**, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

Transferring Cable Cars.

At the ends of cable railroads are placed cargo sheaves, around which the cable passes to return, there being four tracks and two tubes. In order to transfer the cars from one track to another, at the end of the route, two turn-tables are arranged, the diameter of each being a little less than the distance between the centers of the two sets of tracks, each turn-table having two rails across it, equidistant from the center. These two tables are geared together, so that by turning one through an angle of ninety degrees the two sets of tracks will be brought in line with each other, and a car which had previously been brought from one of the lines of rails on to the table, can be pushed on to the other table, and then, by reversing the movement of the tables, the tracks are brought in line with the main line, and the car can then be moved on the opposite track, and on its return journey.

In transferring ordinary cars from one track to another, the tables would be simple plates placed on central pivots, and supporting rolls around the circumference; but the car which carries the gripping apparatus and is called the dummy, having the shank of the grip projecting downward and through the slot into the tube, would in this case have to be raised out of the tube to allow the dummy to go on the turn-table. This operation would not only require time, but the expenditure of considerable labor. That these might be avoided, the table on the Clay street road was constructed of two parts, an upper and lower plate connected together by ribs or ties. The top plate has a slot across its diameter, and the space between the upper and bottom plate will allow the lower portion of the grip to pass through—the ties between the two plates being far enough apart for the grip to pass through without touching. Now, as shown before, by revolving the tables one quarter way round, the slots, through the upper surface of the plates, are brought in line with each other, and the dummy can, with its grip, be pushed from one table to the other, and so on to the other line of rails.

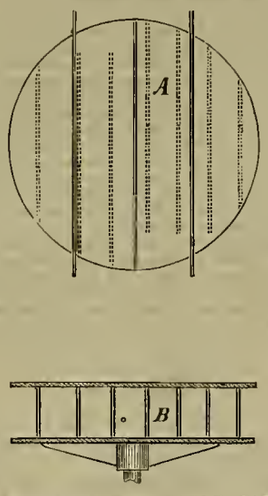
There is still one other requirement, and that is, that the cable shall also pass through the table, so that the dummy may be drawn on to the table and then dropped; and in order that this may be effected, the cable is carried through the table and some convenient distance beyond before passing around the large sheave. Now the connection between the upper and lower plates of the turn-table must be so located that the table may be revolved through one-quarter of a circle without bringing this connection in contact with the cable, which is continually moving through.

In the engraving, which, with the description, are from Mr. W. W. Hanscom's paper on cable railroads, read recently before the Technical Society of the Pacific Coast, A is a plan of the turn-table; B is a vertical section at a right angle to the slot which divides the top plate; C is a vertical section in line with the slot through the top, and shows the manner in which the ties between the two plates are arranged so as to allow the cable to pass freely through when the cable is turned so as to allow the car or dummy to pass from one table to another. Simple as this seems now it is used, it took some ingenuity to devise the plan.

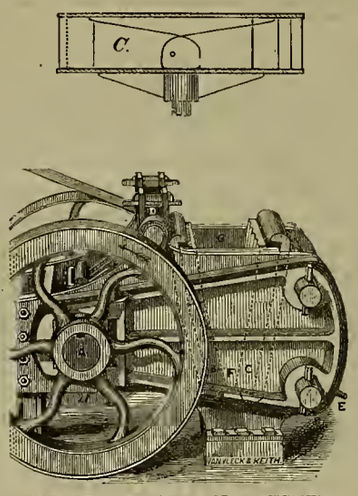
The Brodie Quartz Crusher.

An engraving herewith illustrates Brodie's quartz crusher. The power being applied through the belt (which must be open and must run loose and without a tightener) in the direction indicated by the arrow in the engraving, the shaft is caused to revolve, and by the eccentric to oscillate the jaw *B*.

The oscillation consists in a double motion resulting from the action of the eccentric and the pendulous motion of the links *D*, which cause the point *B* to rise while enlarging the opening *E*, and to fall while closing the opening. This double motion of the jaw, which is not possessed by any other crusher without infringing on the patent of this one, causes a rotation of the pieces of rock while the pressure of the jaw is being applied to them, thus overcoming the force of cohesion, and crushing the rock in the easiest possible manner and with the least expenditure of power.



TURN-TABLE FOR CABLE CARS.



THE BRODIE QUARTZ CRUSHER.

That the power required by this crusher is small is evident from the size of the belt used. The largest size of Brodie's Crusher runs with a ten inch belt quite slack, which may be reduced to six inch and yet do satisfactory work—while some other crushers of the same size require a fourteen inch belt drummed up as tight as possible. The inventor requires that the belts of his crusher shall always be run slack, in order to insure against accident, in case a gad or pick should fall between the jaws. Whenever this happens, the sudden strain throws the slack belt from the pulley and stops the machine—which would not occur if the belt was drummed tight on the pulleys.

When it becomes necessary to renew the hard iron dies in the jaws, they can be taken out; being easily loosened by backing out the wrought iron keys. The zinc filling should then be cut out and the new dies set in their places, having their joints luted with fine clay to prevent the lining metal from running out when it is poured. A good reservoir should be built of the clay around the hole in the top of the jaw. This will insure the perfect filling of all the crevices between the dies and the jaws. The side dies are changed by taking out the bolts which hold them. They can be easily drawn from their places and new ones put in their places. Four sizes of these crushers are made by the California Machine Works (Wm. H. Birch), 119 Beale street, in this city, the size of the opening between the jaws running from four inches by six inches to eight inches by eighteen inches.

A Mining Consolidation.—A meeting of the stockholders in the California and Consolidated Virginia Mining Companies was held Wednesday, at which 141,782 shares of the former company and 388,063 of the latter were represented. It having been resolved to unite the two incorporations in one, the necessary deeds were passed, and the new company was styled the "Consolidated California and Virginia Mining Company." The election of a board of directors and officers for the ensuing year was then proceeded with, and resulted as follows: President, Charles H. Fish; Vice-President, R. H. Follis; A. B. Hull, C. O'Connor and George Congdon. A. W. Havens was appointed Secretary, J. S. Angus, Treasurer, and W. H. Paton, Superintendent. The stockholders of California will receive 2¼ shares of the new issue for each share of the original stock held by them, and holders of Consolidated Virginia will receive 1 1-6 shares of the new issue for each of their original shares. The new stock will be called in the San Francisco Board this morning, and the stock will be ready for issue to-day. A rumor prevails on the street that Sierra Nevada, Union, Mexican and Ophir will follow the example of California and Consolidated Virginia.

The Idahoan mine, seven miles west of Baily, Wood river, Idaho, has been sold for $400,000. The purchaser is Count de Barranca, of London, England. The purchase includes the Idahoan, Idaho Fraction, Belmont, Richmond and Hawkeye lodes in Idahoan gulch, and the Forest Queen in Kelly gulch, and two mill-sites and one water-right in Bullion gulch.

The Bay Horse and Challis regions are now tributary to Ketchum, Idaho, as are likewise the new Lost river camps.

Publication of Mining Notice.

In applying for patents for mining claims, it is necessary for the applicant to publish his intention of applying for patent, in a local paper. A case has recently come before the Commissioner of the U. S. Land Office in which an overcharge has been made for these publications, and he takes the subject up in a somewhat vigorous manner. A gentleman who published his notice in a Colorado paper writes to the Commissioner that in the "copy" furnished the paper all courses and distances were given in figures, which the publisher changed into words, refusing to make any deduction from the cost on account of the extra space thus taken up, although charging the maximum price of fifty cents per line. His excuse is that his office did not contain sufficient figures to "set up" the notices as given to him, and he was compelled to use words. The Commissioner expresses the opinion that this proceeding savors of extortion, and is evidently an attempt to evade the regulation established by authority of Section 3334 Revised Statutes. If the notice issued from the local Land Office was so changed as to add to its length by the substitution of words for figures, the charge being the maximum allowed by law, every line so added and charged for was an imposition upon the applicant for patent. While the publisher's reason for making the change in the notice may have been valid, it was no excuse for adding to the cost of publication.

The Commissioner says: "A newspaper in which such changes are made for the purpose of making an additional charge for publication, can hardly be characterized as "reputable," nor can it be regarded as a fit medium for the publication of the notices required by the mining laws which it disregards. As stated in paragraph 88 of the mining circular, such abuses will not be tolerated."

The Register and Receiver is instructed to tell the publishers that the notices sent must be followed in the published copy, or, if necessarily changed in the manner stated above, no charge must be made for the excess so occasioned. Also, that any overcharge made in the manner above described must be returned to the applicants from whom it has been obtained. In case of the refusal of the publisher so to do, he is told to cease to regard the paper as a "reputable newspaper of general circulation," or to direct the notice of publication therein.

The air compressors of the old Justice works on the Comstock have been sold to go to Quijotoa, Arizona. The Virginia *Enterprise* says that these would probably never again have been used by the Justice Company had they been kept at their works. When the Justice folks resume work it will doubtless be through the Alta shaft. Their own works are left nearly half a mile behind the point to which the lode has been followed by the Alta and Benton companies.

The Little Wood River Mining and Smelting Co., Idaho, have 40 men at work in the mine and concentrator. They take out 40 tons of ore per day, of which 10 tons is first-class ore not concentrated. The balance goes through the concentrator with the other ores, and then to the company's smelters. The smelters are turning out an average of five tons of bullion every 24 hours.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

Discharge of Stamp Mill Batteries.

EDITORS PRESS:—Under the above captiou, iu your issue of 4th instant, you give a description of an alleged invention intended to facilitate the discharge of ore from a battery.

From the descripton given I caunot see in what particular this contrivance differs from one which I described, and I think illustrated, in your paper uiany years ago, which I mentioned in "Testing Gold and Silver Ores" which I have frequently meutioned, always with commendation in my various writings on the subject of milling, which I first saw and used in the Picacho mill in Lower California in 1866, which I used in Mono county in 1874 or thereabout, and which I put into the Kearsarge mill in 1876 where however it did not work, so well, owing to a slight dampness of the ore. The arrangement I speak of was a screen of four, eight, or ten meshes to the running inch in the side of the mortar, the ore passing through it and falling on a fine screen, also attached to the battery and consisting of wire gauze extended on a frame as wide as the discharge of tbe battery, and five or six feet long, which lies "with the surface upward" and through which all particles which are fine enough pass, and fall into a V trough below in which is a screen conveyerwhich carries the fiue ore to an elevator by which it is raised to the roasting furnace. The fine screen is so inclined as that all particles which cannot pass through it may slide over it, and fall into a receptacle whence they may be returned to the battery either automatically or hy hand. The jar imparted to the fine screen by the dropping of the stamps is generally sufficient to make it do its work, but a "joggler" may be employed if necessary. In the Picacho mill, four stamp, we crushed six tons per day through a 40 mesh sieve. The removal of the fine ore to the furnaces, and return of the coarser portiou to the battery, was done hy hand.

In tbe Kearsarge mill, the fine ore passing througb the apron iuto the V trough was screwed to the elevator, and tbe coarse was returned by haud to the battery, the quantity not heing very large. As said, the device did not work so well here, because we bad no drier as I thought, and I reversed the arrangement by putting the fine screens in the sides of the mortar as usual, and making the apron of coarse gauze, about 10 meshes to the running inch. This last arrangement does not increase the stamp duty, as the first does, hut it has a good effect in preventing very coarse material from falling into aud breaking the screen conveyer, in case of the rupture of a screen in the battery —also when, for any reason, it becomes necessary to clean out the mortar, it enables the workman to that quickly, as he has hut to draw the ore out on to, and over the apron, the portion whicb can pass through not heing ahle to do any harm.

Iu either way the invention is quite old, and unless there is some new feature uot manifest from your description, the fact that it could be patented at this late day illustrates a necessity, long since pointed out, for a change in our patent system. C. H. CLARON.

Nogales, Oct. 8, 1884.

Mines of Esmeralda Co., Nevada.

[From our Traveling Correspondent.]

This couuty ahouuds in minerals of almost every description. Iu addition to numerous and productive mines of gold andsilver, copper, lead, zinc, antimouy aud other metals are everywhere met with, principally in combination with silver ores, not to mention her vast deposits of salt, soda, alum, horax aud similar minerals, much of which are already flowing through our channels of commerce, adding to the wealth and admiuistering to the wants of the State aud of the coast.

Hawthorne, the New County Seat,

Upwards of 100 miles from Carson City, on the line of the Carson & Colorado R. R., is beautifully located in full view of the southern part of Walker lake. It is the principal shipping point for the Bodie, Clinton, Sundy and other mines of Mono county, Cal., as well as for Aurora, Coryville, Garfield, Alum Creek, Cat Creek and Kinkead districts, all uew and promising miniug camps of the county and situated from 8 to 20 miles from Hawthorne, with the exception of

Aurora, the Former County Seat

Which is distant about 30 miles. This is an old and once flourishing camp—Rip Van Winkle-like, just waking out of sleep, or like the fabled bird of old, beginning to revive again from her ashes.

While here I visited the Humboldt and Silver Lining mines. They are both situated on the same lode, which runs through tbe center of Humboldt Hill, about one-half mile north of this old town.

The ledge crops out in places at least 25 feet above the surface of the hill. It was a matter of no little surprise to find that a ledge of such a character and size had so long remained unnoticed and undeveloped. But a company has now gone to work in earnest under the supervision of ex-Gov. Blasdell, who is represented to hold a large share of tbe stock.

The ore is worked at the mill of the Humboldt Mining Co. of 20 stamps, situated at Del Monte, on Bodie creek, and some of it at a custom mill of 10 stamps near the mine.

It pays from $15 to $35 per ton, and is worth from $7 to $9 per ounce. The lode betweeu walls is over 30 feet in width. It is free milling and easily mined, and should make its lucky owners a mint of money if properly worked. It will probably take anotber year to open up the miue in good shape, heing down now 70 feet on the Silver Liniug and 100 on the Humholdt, with no other power except tbe windlass. It seems to me that with suitable hoisting works and all suitable facilities which will be added in time, the ore, mostly gold, could be mined and milled for less than $10 per ton, leaving a large margin for profit and room for the employment of 300 men or more, instead of 40, as at present.

The New and Old Esmeralda and Other Claims.

The New Esmeralda is located two miles north of the Humboldt Hill. It is said to be a very large ledge, the ore similar in value and character to the above, and each resembling the Standard rock at Bodie. One hundred tons milled at the rate of about $30 per ton. Some experienced miners who have lately taken a contract on the mine, it is understood, are calculating on getting sometbing like $40 per ton from the rock.

The Old Esmeralda, tbe original discovery in the district, from which tbe county took its name, is said to he an immense vein that has paid from $100 to $300 per ton. Arrangements are being made to put up a large mill. Tbe Prospectus, south of the Humboldt, is very highly spoken of, giving large assays, as well as four or five other mines in the district.

Mr. E. Drake, of the St. Lewis, was not interviewed, hut is quietly working away keeping his own counsels and believed to he doing well. From what has appeared, it must be evident that Aurora is agaiu coming to the front, and will, it is hoped, soou more than rival its palmiest days and yield its millions to the revenues of the country.

Mount Cory District

Lays claim to several valuable mines, or to say the least, excellent prospects, among which may he mentioned the Yellow Jacket, Big Indian, Enterprise, Rising Sun, North Star, Silver Brick and several others, all of which have been prospected more or less, some of them giving very promising results from rich assays or from working tests.

Attention is called first and foremost to the

Plant of the Mount Cory Mill and Mining Company

As the leading claim of this section, being hy all odds more fully developed aud apparently on a very substantial basis financially. The mine is opened by tunnels on differeut levels, hy a shaft 100 feet from the lowest level, and 400 feet of drifts, having attained a depth of 500 feet. Tbe lode varies in width from 30 to 60 feet, with ore chimneys from 1 to 6 feet in width.

The character of the ore is silver-bearing, combined with zinc hlende, fahlore, galena, pyrites of copper and iron, making it somewhat difficult to work. The company have shipped some $300,000 from tbe mine, and are now extracting daily about 60 tons, which works up to $60 per ton in silver at the company's very large and substantial mill, situated eight miles from Coryville, the location of the mine, and four miles from Hawtborne. No attempt will be made to go into a detailed description of the mill and the process of the reduction of this difficult ore to manipulate. It is sufficient to say that three sets of Kronis steel walls are in use, with a crushing capacity per day of 72 tons; four revolving furnaces, in the form of a frustrum of a cone, the invention of Albert Anent, tbe superintendent, said to give the best results in crushing and chloridizing; also 24 leaching vats, and all the necessary appurtenances for complete working by lixiviation.

The mode of extracting the silver is by the Patera process, heing effected by meaus of hyposulpbite of soda in aqueous solution, precipitated by polosulphide of calcium. I have taken the liberty to condense from the Walker Lake *Bulletin* this description of mill.

The North Star Con.,

The property of John Crossman and the Geming Bros., consists of the Young America, Francis, Rover and North Star, the main work heing done on the last named. It has been opened on the lode to the depth of 100 feet, showing at that level 7 feet in width of pay ore, estimated by assays to mill as high as $50 per ton. Some assays have reached $750. Silver Brick ore is represented as assaying from $280 to $300, near surface, one or two assays reaching $2,000 per ton.

Smith & Martin, of the Yellow Jacket, showed me a $25 gold nugget at Hawthorne just taken out of their mine in the neighborhood. They cleared up $80 from 1,800 lbs. of rock by arastra process, and inform me that they have had assays as high as $5,000.

Mines of Alum Creek District.

Tbe Excelsior is down 80 feet. Lode varies from 2 inches to 10 feet. The ore is said to be in the maiu a very high grade free chloride, yielding from $30 to $2,000 per ton—notes do not say whether hy assays or working process. The rock of the Williams mine and of the Nut Pine is represented to be of a similar character. That of the Millsaps and Carrigan is argentiferous galena. The Farrington copper mine, in this district, has reached a deptb of 100 feet, the ore running from 12 to 16 per cent copper.

The Esmeralda Co.'s Claims

In Cat Creek district consist of a group of about 12 in all, said to have fine water privileges and a mill the number of stamps not given. They are at present, as represented by one of the principal owners, runningon gold ore that yields as high as $60 per ton.

In Kiukead district all claims are understood to he coutrolled hy Mr. J. Moss, who is about to erect a ten-stamp mill, the lodes are said to contain rich ore of free gold varying in width from four to eight feet.

The Garfield District.

Tbe Farrington group, consisting of the Lancashire, Atherton, Great Western and others, has reached a depth of over 600 feet, said to show strong veins all the way down, the ore to average $225 per ton and to bave not less than $1,000,000, in sight. The mine is owned hy Farrington Bros. and their five-stamp mill just completed is reported as one of the fiuest (taken in all its departments) ever put up in the State. Steady work with excellent prospects is going on in the Handley claims adjoining. The Blue Light is working 6 men taking out copper ore that is said to average 17 per cent at the smelter (Soda Springs). Other mines have produced well here. It is understood that the Garfield though not now runniug has yielded $100,000 in hullion.

Gillis and Santa Fe Districts,

On the east of the C. and C. R. R., and not far from Luoriug, must receive some notice hefore I close.

Santa Fe district is somewhat celebrated for its large copper ledges of low grade ore from 10 to 12 per cent copper. It is said, however, that a large amount of high grade has been shipped, running from 25 to 30 per cent, some reports going as high even as 50 per cent.

The Tip Top is a silver lode, carrying lead and copper. It has a 300-foot shaft on tbe lode showing a width of from two and a half to seven feet. A car load shipped to San Francisco, as a test, yielded $55 silver, no account heing taken of the copper and lead. The Sun Rise, a mile from this, is said to furnish ore of a higher grade. In Gillis district, from five to six companies are reported at work, some of them making shipments; there are no mills here and no furnaces.

The Hidden Treasure, the property of Mr. L. Smith, of Belleville, has reached a depth of 225 feet and run three drifts of 100 feet each. The vein is narrow but very rich, the ore sampling $500 per ton, first class, netting after deducting for expense of sbipping and working $375, second class $100 per ton. This little mine has up to this time produced $20,000 and what is better than can be said of the great majority of mines, it has been wholly self-sustaining.

A. C. K.

Vanadinite.

Mr. Francis Hayes Blake, gives the following description of the mineral of Vanadinite, in Pinal county, Arizona:

Tbe rare mineral Vanadinite is found in tbe "Black Prince mine," Pioneer mining district, Pinal county, Arizona, in brilliant red and yellow hexagonal crystals. Qualitative tests show the presence or vanadium, chlorine and lead.

The crystals occur in tbe seams of a partly decomposed rock resembling trap, covering completely in some cases five square inches of surface. They vary in size from one sixty-fourth to one-eighth of an inch in diameter, sometimes reaching the length of one-quarter of an inch. They are often implanted by the side, and are then doubly termiuated. The majority of these crystals are of a deep red color; some vary from a red at one end through deepening shades of delicate straw-yellow to orange and red at the other end. Others exhibit a succession of layers of deep red aud light yellow parallel to the hasal plane. Many of the crystals are cavernous, and fibrous, resembling in their cavernous structure the prisms of pyromorphite. The prismatic planes *I* are striated vertically, which in this respect is just the opposite to what occurs in pyromorphite.

Tbe simple hexagonal prism, without modifications, predominates as the crystalline form; although in some groups of crystals is found the combination of the two prisms *I* and *i*-2, with the hasal edges replaced by planes of the pyramid of the first series. These planes are very minute. I was unable to find planes between *O* and *i*-2.

Wulfenite is also found in this miue, hut not in very perfect crystals.

A NEW PROCESS.—Gen. J. E. Condict, manager of the Pacific Coast Electrical Construction Company, is on his way to tbe Philadelphia Electrical Exhibition. Mr. Condict has made many experiments in desulphurizing ores by electricity, and will make that the subject of special study while East. It is quite within tbe possibilities that works of that nature will he put up in Reno within a few years, or possibly within a few months. He thinks this would be the best location on the Coast for such a process.—*Eureka Sentinel.*

Crystallized Gold in Prismatic Forms.

Near Clancey, on Clancey creek, Jefferson county, Montana, minute crystals of gold occur which present the novelty of a solid octahedral nucleus, or head, witb a long, divergent brusb-like or prismatic development of the gold on one side, or angle, giving the whole the appearance of the drawings usually made to represent comets. The total lengtb of these crystals does not exceed from two to three millimeters (about one eighth of an inch), and the minuteness of the cross-section of the delicate divergent prisms makes it extremely difficult to determine their form. Tbey are, also, very brittle, and they appear to cleave or break asunder in planes at right angles to their lengtb. Under the microscope these prisms are seen to have three or more planes and they appear to be hexagonal. They taper gradually and uniformly to a sharp point, and are sometimes composite, heing for part of their length formed of two or more prisms joined side to side.

Among the fragments, one, larger and broader than the others, exhibits a solid octahedral nucleus with a flat or plate-like projection on opposite sides. This projection shows distinctly on one side a line of composition through the ceuter, with divergent lines or markings at an angle of 45° with the medial line, corresponding in angle and in direction with small planes on the edges. The same side of this plate which shows the medial line of composition is slightly trough-shaped, heing formed of two plane surfaces inclined towards the medial line. The opposite side is rough, with angular projections.

These plate-like projections from the octahedron are much larger than the prisms, but it is probable that the origin and crystallization of both are similar. Tbe plates have the appearance of being formed hy the combination or twinning of octahedrous parallel with their faces, with their main axis inclined towards each other at an angle of 60°.

Hexagonal Prisms of Gold.

At Sonora, in Tuolumne county, California, I obtained some years ago from the late Dr. Snell a sample of very small but brilliant prisms of gold. Under the microscope these are seen to be hexagonal prisms with smooth and brilliant planes and terminated at one or both ends with a pyramid. They appear to be well formed crystals without marks of compositiou or twinning. The basal plane is also visible. The angle between the prism (*I*) and the pyramid (1) is approximately 130°, by measurement kindly made for me by Prof. E. S. Dana. Tbey resemble the prismatic gold crystals figured by Prof. A. H. Chester, and obtained artificially by digesting gold amalgam in nitric acid. It is possible that tbe Sonora crystals are also artificial, but there is no means of verifying their origin. Similar crystals obtained at Angels Camp, in tbe same region, were said to have been taken from a cavity in quartz.

The crystals described hy Prof. Chester contained six per cent of mercury. Le Sage, a writer of the last century, 1777, also mentions prismatic crystals of gold obtained hy heating the amalgam. He describes them as square prisms with terminal pyramids of four planes, and considered tbem to be lengthened octahedrons.—*Prof. W. P. Blake, in American Journal of Science.*

SHASTA COUNTY MINES.—The Shasta *Courier* says: In a recent issue we spoke of the vast amount of sulphurets encountered in many of the large ledges in this county, and said that wben the right processes were discovered and applied to the working of tbese ores, old Shasta would forge to the front as the hoss mining county of the State. And, almost as we wrote, the elucidating geni was at hand. Mr. Palmer, of the renowned Denver, Colorado, Reduction Works, has been here for several weeks examining various mines and taking samples from the same, from which he will make careful working tests. In case the tests are favorable (and they are sure to he so), a smelting branch of the Denver establishment will he erected in this county at some point most accessihle to the principal mines. Mr. Palmer has spent about a week at Iron mountain, and we understand that he is astonished and delighted at the vast mineral resources of that wonderful ore body. There is light ahead for the ledge-owners of Shasta county, and the chances are that they may yet be ahle to rejoice in their day and generation.

A UNIQUE FORMATION FOR A MINE.— Iu formation, the Colorado Central, one of the big mines of Georgetown, Colorado, stands alone. The Georgetown *Courier* thus describes its peculiarities: A singular phenomenou of this mine is tbe veiu of obsidian, or volcanic glass, found between the north mineral and wall. The north wall of the mine is porphyry. Next to the porphyry is a thin selvage of grayish material, which is quite solid when taken out, but rapidly becomes friable and clay-like wben exposed to the atmosphere. Next to this is a vein of obsidian, varying in thickness from a thin seam to ten feet, and averaging about thirty inches. This has been fouud to be continuous for 2,000 feet in length in the workings, and crops out at tho surface 2,500 feet west, wbere it crosses to the north side of the dyke of porphyry. Another selvage of clay-like material lies between the obsidian and mineral vein.

MECHANICAL PROGRESS.

Home-Made Emery Wheels.

The solid emery wheels have made possible a wonderful advance in the surfacing and polishing of metals in the shop, in truing centers, sharpening tools, and in other processes. Yet in some cases, they are not equal to the home-made wheel for one reason—they become smaller by using, like the grindstone; and there are jobs where it is very desirable that the emery wheel should retain its original and uniform size. It is well, therefore, to give a few words of this almost forgotten shop lore.

The emery wheel should be of soft wood pine is to be preferred—made of alternate layers of boards planed to make good joints, put together with glue and screws, the grain crossing each alternate layer of boards, which should be not more than three-quarters of an inch thick; half inch boards are better. Make the wheel slightly thicker than it is to be when finished, as it is to be turned and trued on the sides as well as the face. With a band saw or gig saw, shape the glued-up and screwed boards to a circle, chuck it in a lathe, and bore and turn a hole and recess at the center to receive a disk, or gland, of iron that has been bored and faced up, having screw holes in its flange. The hub of the gland should be seated in the wooden wheel. When the gland is in place and secured, the wheel is ready to be turned to finish. It is mounted on an arbor for this purpose. Some wheels are to run on a threaded arbor, and the gland is therefore threaded.

After turning to size, peg a belt or band of wet belt leather with shoe pegs to cover the rim of the wheel, flesh side of the belt outside. This makes a hard wheel. If one with a yielding surface is desired, peg on layers of Canton (cotton) flannel to the requisite thickness, carrying them over the edges of the face to make a round edge. Cover the whole, not with leather, but with strong denim or bed ticking, pegging or tacking it on the sides of the wheel. This makes a soft or stuffed wheel, which is for polishing—not grinding—and it will do work of a somewhat irregular form.

Brush the face of the wheel with hot glue, pass a round bar through the center, and roll the wheel in emery that is spread in a shallow trough or on a clean table. Any particles of iron or steel filings in your emery will make trouble; have the table or trough perfectly clean. One coating of glue and emery is better than more, for when the outer coating is worn off the glue will glaze. Do not rap off any of the loose particles of emery until the wheel is perfectly dry; the reason is obvious—the undried glue will not hold the particles in place.

When the wheel has been worn, the glue and emery is to be removed by soaking in water, and the facing repeated. If the use of these wheels is sufficient to warrant the trouble, it is well to have a trough of water in which two iron rolls revolve by power, the faces of the rolls far enough apart to allow an emery wheel to ride and roll between them, the shafts of the rolls to be connected at one end by gear wheels and an intermediate, so that they both turn in the same direction, and the emery wheel standing on its face will be slowly revolved by their combined action, the water in the trough being at a sufficient hight to just wet the face of the wheel as it turns. This method prevents the whole wheel from being wet and warped. If this method is not feasible, repeated hand washings of the face must be made to soften the glue.—*Scientific American.*

Tempering Steel by Compression.

M. Clemandot's method consists in heating the metal so that it becomes sufficiently ductile, and then submitting it during cooling to a strong pressure. He noticed that this treatment affected the structure of the metal in such a way that it acquired properties analogous to those brought out by tempering. The metal thus obtained differs considerably from steel simply cooled, by its finer grain, its greater hardness, and its greater resistance to rupture, particularly with grades of pretty high carbon steel. In these respects it approaches in quality steel tempered in water, without being identical with it. It has two different effects, almost simultaneously—an energetic and continuous compression, and a rapid cooling of the steel. The cooling is caused by the contact with the platform of the hydraulic press, and takes place much more rapidly than when the same piece is allowed to cool without being compressed. The remarkable results obtained by M. Clemandot are explained by the combined action of cooling and compression. The first, in its results, resembles the compression effected by hammering or rolling; the second the effect of tempering by immersion. It has been urged that the piece of steel must be inclosed by a mold into which it fits exactly. It is, however, only necessary that the compression act upon two opposite faces. A square bar, whether straight or curved to horseshoe shape, need only be laid down flat and compressed between the two platforms of a hydraulic press. In order to obtain the best results, the cherry-hot piece of steel should be as rapidly as possible subjected to the pressure settled upon beforehand, ranging from 10 to 30 kilogrammes per square millimeter.

While the tempering process by immersion brings about an increase in the volume of the steel and a corresponding decrease in its density, the action of high mechanical pressure during the entire process of cooling tends to bring the metal back to its original volume or its normal density, thus preventing the creation of a state of intermolecular tension noted in tempered steel. Actual experiment has confirmed these theoretical deductions, so far as the resistance of the compressed steel to stress is concerned.

American vs. Russian Sheet Iron.

American planished sheet iron is now made fully equal if not superior to the best Russian iron. A Pittsburg firm, W. D. Wood & Co., have labored assiduously for 30 years to perfect this description of iron. They have now attained such a degree of success in its manufacture that some workers in that metal pronounce it quite superior to the Russian make. It is said to be more evenly rolled, equally soft and ductile, more highly polished, or "glanced," as it is technically called; equally as durable to weather, exposure, etc. It is also made of different widths, which gives it the advantage of being worked up more economically, while Russia iron is always made of a given length and width, and probably always will be.

It is no longer necessary to go to Russia for this indispensable material. We can now obtain it from our own shops, and it is said that since the more recent improvements in its manufacture have become generally known the importation of the foreign article has fallen off fully one half. Indeed it is stated that the consumption of American planished iron is now more than double that of the imported article. We have in this manufacture another evidence of the mechanical progress which our people are making.

STEEL OR IRON.—The questions, What is steel? and, What is iron? which have led to such memorable discussions in this country, are now troubling French iron-masters, and, to a much less extent, the French customs officials. The duty on steel is higher than that on iron, and it has been the practice of the French custom-houses to look upon the property of steel that it hardens when quenched in water as its distinctive characteristic. Everything went on well until what we term in this country "soft steel" was put on the markets of the world in large quantities. French importers seized the idea of calling this metal "fer fondu," translating the German word "Flussesisen," and took advantage of the fact that it will not harden to claim that it was iron, and not steel, and as such should be admitted under the lower duty. The French iron-masters protested vigorously, and in consequence of their objections the Minister of Commerce submitted the question whether the metal in question was iron or steel to the Comite Consultatif des Arts et Manufactures, who detailed Professor Lan, a very widely known metallurgist, to study the question. M. Lan reported that it was steel, even if it did not harden; but still the customs officials insisted on their classification, and the hardening test as its basis. Thus, for the present, in France, soft steel is iron.—*Engineering and Mining Journal.*

TEMPERING.—In tempering steel, water mixed with ice gives the very superior results. One may even insert some small tools to advantage in a lump of ice, as jewelers and watchmakers do when they temper them in sealing wax. Often oil is used and is preferable to water because it is easily evaporated. Damascened blades, it is well known, are tempered in a strong current of cold air passing through a narrow chink, a temper more uniform than with water being thus obtained. But of all means for this purpose it is believed the most efficacious is metallic liquid, and mercury being the only one known, and always a good conductor of heat, as well as the best of liquid conductors, it has come to be regarded as an unequalled bath for tho tempering of very sharp steel tools. A very sharp steel, to which in forging it a convenient form was given and which was afterward tempered in mercury, might be equal, it would seem, to cutting through almost any substance.

THE GJERS SOAKING PIT is gradually coming into use both in this country and in Europe. It effects a great saving of fuel, by enabling the double process of carting and rolling to be made by one heat. It is now in continuous operation in four Bessemer works in England, two of which roll off directly without any furnacing whatever; and it is to be started at the largest open-hearth steel works in Scotland. On the continent two Bessemer works are using the soaking pit, a third one is just starting, and one open-hearth plant is also employing it.

AMERICAN EDGE TOOLS.—The reputation that once gave Birmingham the control of the edge-tool market of the world is slowly but surely settling down upon our own makers, and why not? Better wages bring to our shores the best and most brawny mechanics of the Old World, and protection insures profits that justify ample expenditures on machinery, buildings, etc.

TEMPERING BRASS WIRE.—Brass wire as used for spiral, and various other springs is tempered by drawing, without annealing; this is what is called "hard drawing."

SCIENTIFIC PROGRESS.

Electric Properties of Flames.

In Wiedemann's *Annalen*, Herr J. Collert describes the results of investigations on this subject, of which the following abstract appears in the Chemical Society's *Journal* for June: "This investigation is a continuation of Hankel's researches on the electrical properties of the Bunsen and alcohol flames. The method of experiment was as follows: A spiral of platinum was placed in the flame symmetrically with its axis, and connected with one pole of a Hankel electrometer, the other pole being in connection with the burner; the electrometer was also connected by a commutator with the poles of a zinc-copper pile conducting to earth. The principal results of the investigation are as follows: "1. The difference of potential is dependent on the material and the temperature of the mouth of the burner; an electro-potential series of the materials of which the burners are constructed can be arranged, of which iron is the most negative. 2. The difference of potential is also conditioned by the position of the spiral; the point at which the greatest electromotive force is produced coincides probably with that of maximum temperature. This latter result probably represents the sum of several conflicting causes: first, by the rise of temperature the platinum is positively electrified; secondly, by contact with the hydrogen and carbonic oxide gas it is negatively electrified; and thirdly, in the cooler parts of the flame it is positively electrified by contact with steam and carbonic anhydride. As regards the second of these points, the experiments of Deville tend to show that the higher the temperature the greater proportion of free hydrogen and carbonic oxide present; while Grove has shown that platinum is negatively electrified when in contact with these gases. 3. The results obtained by the author agree with those of Elster and Geitl."

PREDICTING THE WEATHER FROM THE COLOR OF THE STARS.—From the fact, determined by W. Spring, that the color of pure water in great bulk is blue, M. Ch. Moutigny explains the predominance of this color in the scintillation of the stars just before and during wet weather. The luminous rays, he argues, traversing the air charged with large quantities of pure water are necessarily tinged with the blue color of this medium. The excess of blue thus becomes an almost certain means of predicting rain. This theoretic conclusion corresponds with the results of his observations continued for several years past on the appearance of the stellar rays in connection with the state of the weather. During the few months of fine weather in the present year, blue has been much less conspicuous than in the corresponding months of previous years since 1876, when wet weather prevailed. It also appears that green, which had always coincided with clear skies during the fine years before 1876, has recently again become predominant. Hence he thinks it probable that we have got over the cycle of bad seasons, and that dry weather and more normal summers may be anticipated, at least for some time to come. The above is from *Nature*, and the same number contains an abstract of a paper by Professor C. Michie Smith, on green colored suns, in which he concludes that this phenomenon is due to the presence of unusual quantities of watery vapor in the atmosphere.

THE MICROSCOPE.—A writer on the manufacture and use of the microscope corrects one of the common errors prevalent concerning its use, namely, that the higher the power capable of being employed the more valuable the instrument, the fact being that equally satisfactory results are known to have been obtained with one of 3,000 diameters as of 100,000. The ordinary work for which a physician uses a microscope requires from 100 to 500 diameters only, while special work can be done with ease with from 2,000 to 5,000 diameters. Again, "times" and "diameters" are not synonymous, the diameter being, of course, the distance across the object, so that if an object be magnified 500 diameters, it is magnified 250,000 times, or the square of the diameter, the difference, in point of fact, between the two dimensions in measurement, being quite apparent. The degree of curvature is what makes the glass a magnifier, and the two kinds of glass used tend to correct each other's inaccuracies. The glass is cooled so gradually and stirred so constantly as to be perfectly homogeneous.

CHEMISTRY.—There is no department of modern science that receives a larger share of attention than that of chemistry. The tendency of present effort and thought is toward analysis. Everything must be subjected to the disintegrating process. If anything by common consent is pronounced good, it must be taken to pieces, that its construction may be understood, and so the better appreciated; if it does not meet with general favor, it still must be dissected, and its constituent parts subjected to the closest scrutiny. Hence, we see students in the various departments of natural science and biology resort to a careful investigation of the primary elements of matter, that they may thereby gain such information as will substantiate their theories. If, in addition to this, we consider how much the science of chemistry has benefited the world in the various departments of the useful arts, we can readily understand why so much attention is being given to it by students, and why so many new works appear on this subject.

SMALL ELECTRIC MOTOR.—The visitor at the Philadelphia Exposition finds nothing that interests him more than the little electric motors that are used for running sewing machines, lathes and household machinery. In one place a hundred girls are engaged in sewing by the aid of these motors, and they are enthusiastic in their praises. It tires them less, while they are able to do a third more work. This business has assumed great importance in the large cities. In Boston contracts have been made to place 10,000 of these little motors in use, the current being supplied from the stations by the electric dynamos. This branch of the business promises greater profit, even, than the light. In Philadelphia the Brush Company are running these motors for five cents a day each; and as the current of one arc light will supply fifteen motors, a very handsome revenue is derived from this source. There are very few householders but what would gladly rent a cheap power like this.

INTERESTING EXPERIMENT WITH MAGNETS.—A curious and instructive experiment has just been made by M. Duter, who took a number of very thin plates or disks of tempered steel, about a millimeter thick, and from five millimeters to forty centimeters wide, and built them into piles, the adjacent plates being sometimes in contact, and sometimes separated by a sheet of paper or cardboard. These piles were then inserted in a very powerful magnetic field, and withdrawn. It was then found that they had become powerful permanent magnets; but when the individual plates were separated they seemed to have lost their magnetism. On building up the pile again the original magnetism was restored to it. It appears then that the thin plates have not really lost their polarity on being withdrawn from the exciting field. Some of Professor D. E. Hughes' recent experiments have a great similarity to M. Duter's.

LIFE FROM THE DECOMPOSITION OF AUTUMN LEAVES.—According to the researches of a microscopic naturalist, who has been investigating experimentally and by observation from nature the forms of life produced by the decomposition of autumn leaves, trees have played a very important part in the elaboration of alluvial deposits and increasing the fertility of the soil. He finds three special organisms peculiar to the resolution of leafy tissue into soil. One is a large ovoid, disciform organism, of pale yellow color, and without organs of prehension or locomotion; the second, a well-developed animalcule, with double rows of tentacles at each extremity; and the third, a rod-shaped creature, also with tentacles at each end, which moves by alternate contraction and expansion. Millions of these creatures inhabit every thimbleful of forest mold, and concur in its conversion into alluvium.

TO DETECT WATER PASSING OFF FROM A BOILER WITH STEAM.—Herr Stoupler, of Luzerne, Switzerland, by adding fluorescine to the water of a boiler, which by calorimetric test enabled him to detect the presence of one-half of one per cent of water carried mechanically out of the boiler by the steam, found that from 2.3 to 4 per cent was actually thus present in the steam. The deep green color of the water in the boiler was retained in it for weeks, and yet no trace of coloring could be detected in the water condensed in the steam cylinder—a proof that the water which gathers there is entirely due to condensation caused by the expansion of steam, and that very little water is actually mechanically carried away by the steam from boilers.

PURIFICATION OF OILS.—Oils containing free fatty acids and other impurities may easily be purified, according to Viallis, by filtering through charcoal impregnated with soda. For purifying large quantities of oil, tubs with perforated bottoms are used. A layer of flannel is placed upon the perforated bottom, over this a layer of impregnated charcoal, about 20 cm. in depth, and in case the oils are to be obtained colorless, a layer of bone black is added. By placing two or three of these tubs, one below the other, and passing the oil through them successively, a perfectly pure product is obtained.—*Corps gras. ind.*

AN INTERNATIONAL SCIENTIFIC CONGRESS.—During the recent meeting of the American and British Associations a proposition was brought forward for the organization of an International Scientific Association, to meet at intervals in different countries of the civilized world. It came in the shape of a petition signed by many members of both the British and the American Associations. The matter was referred to a committee from both associations, which joint committee will confer and report hereafter. The idea meets with very general approval.

FIRES IN COLLIERIES.—M. Durand, who has been studying the reason of spontaneous combustion in collieries, attributes it to three causes—the oxidation of iron pyrites in the coal, friction from slipping and heat of air current,

Passing Events.

The heavy rains which have been falling several days of this week in California have done more or less damage to exposed grain and to the grape crop. They will be a help to mining operations, however, giving more water where water is used for power, and starting the springs and streams. It is unfortunate, however, that the hydraulic miners can no longer utilize the water in their operations. To them a heavy rainfall meant longer water season and increased profits.

The Little Rocky mines in Montana have attracted a large number of men who are now prospecting that region.

Cabeo district, in San Bernardino county in this State, announces a rich strike of silver ore in one of its mines this week. In the last month several good developments in silver mining have been made in that district. The camp has produced some $600,000 so far this year.

A new mining region is announced this week, in British Columbia, about 80 miles from the mouth of the Skeena river. A big rush is expected in the spring. The mines are gold placers.

AN Arizona paper states that at least 20 per cent of the mining failures in Arizona may be justly charged to the disposition of Eastern companies to try new styles of reduction machinery. It is time to call a halt in this kind of business folly.

A New Metallurgical Process.

Working Auriferous and Argentiferous Arsenides and Sulphides.

In the MINING AND SCIENTIFIC PRESS of August 16th last we described a new method of separating gold and silver from arsenide of iron, the invention of Mr. Edward Probert, of Eureka, Nevada, by introducing litharge or lead into the auriferous or argentiferous arsenides and sulphides of iron or copper, while in a state of fusion. Mr. Probert has now patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improvement on the process, namely: Stirring the material under treatment by means of an elastic vapor or vapors, generated by the action of the molten mass upon a mineral substance or substances within the pot or receptacle in which the material is being heated, and without the aid of any mechanical stirring by hand.

The success of Mr. Probert's method of treatment by the introduction of litharge or lead into the molten mass depends largely on the thorough and intimate blending and admixture of the lead with the arsenides, sulphides or reguline metals under treatment. The stirring by hand is a tedious, and at best an imperfect, means of effecting the object in view, and in some cases an impossible one, as in that of the arseuides of iron, from the corrosive nature of the substances themselves, which rapidly destroy all implements of iron or steel introduced into them for the purpose of stirring. Mr. Probert's new invention is a method by which the mechanical stirring is rendered altogether unnecessary, and a much more complete blending or mixing of the material is effected.

The method of proceeding is as follows: Iron pots, of a conical shape, about 30 inches deep, 30 inches wide at top, and rounded off at the bottom spherically to about 12 inches in diameter, each capable of holding 1,500 weight (more or less) of the substance to be treated, are coated with a lining of refractory material, composed, preferably, of decomposed or pulverized lava, pumice, or other volcanic rock, but when this is not obtainable, of silicious sand, with a certain admixture of finely pulverized limestone or calcareous marl, to which has been added a sufficiency of clayed water or milk of lime to work the whole into a paste. After laying on this internal coat of refractory material (intended primarily to protect the pot from corrosive action) to the thickness of about three-quarters of an inch, a further portion of a specially prepared composition, consisting of coarsely crushed limestone, dolomite, siderite, or other suitable carbonate, mixed with a sufficient quantity of the ordinary composition with which the pot is lined to give it consistency, is laid on the bottom of the pot to the thickness of one inch, more or less.

The pots thus prepared are placed in a suitable oven or chamber, or a small fire is placed inside each pot, to dry the coating, which, however, is not to be baked so as to expel the last portion of moisture, but only so far as to remove the excess of water. When required for use, the pots thus lined and partially dried are placed in succession under the spout of the smelting furnace containing the substance to be treated in a state of fusion, which is then tapped into them, while at the same time, or immediately afterward, a charge of lead or litharge, preferable granulated, is fed into each pot from a hopper conveniently placed above.

The first effect of the molten substance tapped from the furnace into the pots, is to convert the small amount of moisture contained in the protective lining of the pots into steam, which, rising upward from the bottom and sides, causes a brisk ebullition of the molten material. This treatment is insufficient in itself to effect the thorough stirring and blending of the contents of the pot necessary to assure a successful result; but no sooner is this first ebullition, due to the escaping steam, over, than the limestone, dolomite, or other carbonate fixed in the bottom of the pot, as well as the calcareous matter in the whole lining, begins, under the intense heat of the molten charge, to undergo calcination, and streams of carbon dioxide are sent off, which, rising upward through the molten matter, produce the effect of a small geyser. This keeps the charge in a state of ebullition and agitation for a period of time proportionate to the quantity of mineral carbonate, or other source of carbon dioxide, originally used in preparing the pot, and thus effecting such a complete blending and intimate admixture of the ingredients as cannot be attained in any other way.

The duration of the ebullition, and, consequently, the stirring process, may be regulated to any required number of minutes, from five upward, or as long as the molten material continues hot enough to exercise a calcining effect on the limestone, etc., and inasmuch as the carbon dioxide produced comes off in a steady stream without sudden bursts, as from the vapor of water, there is never any danger to the workmen from explosions. After ebullition is over, the pot with its contents is set aside to cool, when the lead settles to the bottom, carrying down with it the precious metals, and, when solidified, the mass of alloy can be detached from the waste matter and treated by cupellation in the usual way for the separation of the silver and gold. It will thus be seen that the stirring is effected partly by steam, which, however, can never be made to do the whole work, being too violent in its action, and causing trouble when too much moisture has been left in the composition, but chiefly by the carbon dioxide ("carbonic acid," so-called,) developed during the calcination of the limestone or other carbonate employed as the source of gas or vapor.

Although this description has referred only to the mineral lining of the pot and to the mineral substance attached to and practically forming a part of the lining as generating the elastic vapor or vapors, Mr. Probert does not strictly confine himself to this method, for in the treatment of a number of substances it would be practicable to hold down, introduce or support in some other manner within the mass the suitable mineral substance or substances to effect a similar result as that which is described.

Mr. Probert is aware, of course, that in the operation of "poling," in the working of copper and lead, a piece of green wood is thrust into the molten mass to agitate the material, and also aware that in the Bessemer steel process air is forced into the material, and in the process of pattisonizing lead, steam is forced in; but his process here described differs from that of poling in that the elastic vapor is generated by mineral substances—a distinction highly important in many cases—as, for example, in the working of arsenide of iron, where wood cannot be used at all; and it differs from the steel and pattisonizing processes in being generated within the pot by the described action of the molten mass upon the mineral substance.

New Ore Pulverizer.

Mr. D. Virgil Goodson, of Bodie, has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improved form of ore pulverizer of that class in which heavy wheels or rollers travel over an annular track or bed, to which the ore is fed.

The frame carrying the rollers is given a rotary motion in a horizontal plane, and the double sets of rollers are caused to travel around on the annular beds. Ore is supplied to a series of hoppers and chutes as they pass under the discharge spouts of the main supply hopper, and each receives enough to last it one round.

The ore passes down on to trays, and by these is shaken off into the outer bed, in which it is crushed by the outside series of rollers. The partially crushed ore or pulp, as it has now become, thence passes inwardly through screens, and over an inclined surface and other screens, into the inner bed, on which it is pulverized very fine by the inner series of rollers.

In passing over the screens, that portion of the ore which has been crushed sufficiently fine drops through the screens into a trough, and is thus disposed of, while the coarser ore passes into the lower inner bed. Thence, after being crushed equally through screens into the trough on one side and over the sloping surface into the other trough, and is discharged from both troughs into receivers.

The coarser screens are intended to permit the partially crushed sand to pass freely. The rollers, being vertical, pass easily over the larger rocks without being impeded. They bear none of the weight of the frame, this office being performed by anti-friction rollers. The inner set of rollers on the inner bed—which is lower than the outer bed—are thicker than the outer set, in order, by reason of a greater surface, to pulverize the ore more thoroughly.

The New Mineral Colemanite.

Preliminary Note on the Morphological and Optical Properties of Colemanite.

At the last meeting of the California Academy of Sciences, A. Wendell Jackson, of the Museum of Mineralogy, University of California, read a paper on the new California mineral—Colemanite—of which the following is a synopsis:

On Feb. 4th, 1884, Mr. J. T. Evans read a short paper on a new "borocalcite," to which the name "Colemanite" had already been given by those commercially interested in the substance. Mr. Evans' chemical analysis led to the formula:

$$Ca^2\ B^6\ O^{11} + 5aq.$$

This borate differs from Pandermite only in containing two more molecules of water.

The peculiar interest attaching to Colemanite comes, however, from the fact that it is the first of the "borocalcites" that has been found crystallized. Mr. Evans assumed, from the general habit of the crystals, their monoclinic character, and measured with a contact goniometer the angles:

(001): (100)=70½°
(110): (110)=108½°

Four weeks ago Mr. Evans had the kindness to send me two of his crystals for further study. Recently I obtained from the owners of the deposit about twenty more crystals, so that I am now in possession of a sufficient amount of material to make a careful study of the morphology and the optical constants of the substance.

I make, to-day, merely a preliminary statement of the results thus far obtained, and reserve, for a paper to be published shortly, the fuller discussion.

The crystal which I have measured is a short columnar form (5x5x6 m. m), perfectly colorless, with brilliant faces giving, in the main, excellent reflections. Mr. Evans' assumption as to its monoclinic character, is confirmed by the examination in parallel polarized light. The crystal extinguishes parallel to the chief axis when viewed through the orthopinacoids, and at an angle of 6° 35' (to the rear) when viewed through the clinopinacoids. The plane of the optical axes is normal to the plane of symmetry, lying in the obtuse angle of the morphological axes, at an angle of 83° 25' with the chief axis. The angle of the optical axes is very large, and whether the orthodiagonal or the line at right angles thereto is the bisectrix, I have not yet determined, as the foci of the ellipses in converging polarized light are not visible in the cleavage laminae parallel to the clinopinacoid.

The axis ratio is:

$$\dot{a} : \bar{b} : c = 0.77484 : 1 : 1.08199.$$

The angle C=69° 50' 45."

The angles of the observed forms, calculated with this ratio and value of C, agree very closely with the measured angles.

I have already observed and measured thirty-four forms on the crystals. The forms thus far determined are the three pinacoids; the primitive, three clino—and one ortho-prism; three clinodomes, five positive, and two negative hemidomes; ten positive and six negative hemipyramids.

The crystals have perfect cleavage parallel to the clinopinacoid, and distinct cleavage parallel to the base. Hardness, according to Mr. Evans, from 3.5 to 4.25. Density 2.428 (Evans).

Analysis gives according to Mr. Evans:

$B^2\ O^3$	[50.98]
$Ca\ O$	27.18
$H^2\ O$	21.84
	100.00

The mineral occurs in the southern end of Death Valley, Inyo Co., Cal., in an alluvial deposit, in company with pandermite and quartz.

BETWEEN midnight and morning Wednesday of last week, some miscreant attempted to blow up the cabin of C. H. Young, superintendent of the Empire mine, on Empire creek, Siskiyou county, with giant powder. Fortunately Mr. Young was awakened by the smell of the burning fuse, and had got outside when the explosion occured which wrecked the cabin.

DURING the week ending the 11th the following shipments were made out of Utah Territory: Forty-two cars bullion, 983,531 pounds; three cars of lead, 85,195 pounds, and thirty-four cars of ore, 1,048,420 pounds. Total, seventy-nine cars, 2,177,146 pounds.

The World's Fair Buildings at New Orleans.

The grand World's fair will open in New Orleans on December 1, 1884 and continue during the winter. We give on this page views of the leading buildings which are now rapidly approaching completion.

The main building is the largest ever erected. It is 1,378 feet long by 905 feet wide, without courts, and has a continuous roof composed largely of glass so arranged as to afford an abundance of light without subjecting the interior to the direct rays of the sun. Within, the view is unobstructed. From one side or corner of the building to its opposite, the interior showing all the phases of industrial activity is seen. There are no partitions, and the lofty pillars, wide apart, supporting the roof structure, present no impediment to one's vision, but only serve to assist the eye in measuring the vast expanse. The interior is surrounded by wide and spacious galleries, twenty-three feet high, which are reached by twenty elevators having the most approved safety appliances, and by convenient stairways. The machinery department occupies a space of 1,378 feet long by 300 feet wide, within the main building, and has an extension added in iron 350 feet long and 150 feet wide for heavy machinery, described under the heading of factories and mills. From the galleries overlooking more than two miles of shafting can be seen driving every known character of machinery. Music hall, with a seating capacity, in commodious chairs, for 11,000 people, a platform capacity for 600 musicians and a mammoth organ built to order for the exposition occupies the center of the interior. The main building will contain general exhibits. It is situated about in the center of the grounds.

The building erected by the United States and to be devoted to the U. S. and several State exhibits is 885 feet long by 565 feet wide. It is one of the largest exposition buildings ever erected. At the time of the adoption of the plans it was supposed that the main building, having the largest capacity of any building heretofore erected, in conjunction with the horticultural hall and such minor outside buildings as were necessary, would afford ample space and accommodation for all exhibits; but the interest in the World's Exposition had become so widespread, and the inquiries and applications for space became so numerous, that the necessity for additional accommodations became imperative, and the management determined upon the erection of this magnificent structure specially for the United States and State exhibits. The Government exhibition will be complete—of itself, almost a mammoth exposition. Each department will have its distinctive exhibit. The department of State showing samples of cotton, wool and cosmos fibers, and of the fabrics made from them from all parts of the world. This exhibit will be arranged in continental groups representing the geographical divisions of the world's commerce, etc. The post-office department will exhibit all the improvements in mail facilities, and establish a branch office in the building for the accommodation of visitors, and to show the practical workings of the postal system. The treasury department will exhibit coast survey, light-housing, life-saving service, customs, internal revenue, engraving, printing, etc. The war department will show arms, ordinance, engineering, medical, surgical and hospital services, progress in same, etc. The navy department will show naval arms, ordinance, projectiles, torpedoes, dynamo-electro machines for firing, models of war vessels—ancient and modern, etc. The interior department—everything pertaining to the inventions and improvements in American industries and to the history, customs and habits of the aboriginal races, etc. The United States Fishery Commission, the Department of Justice, Bureau of Agriculture, the Bureau of Education, and especially the Smithsonian Institute, will be exhaustively represented. The Government exhibit will vastly exceed that made at Philadelphia. In addition to the Government exhibits, the collective State exhibits and the general educational display will be located in this building. This structure presents a very attractive appearance.

The Horticultural Hall is 600 feet in length and 194 feet wide through its center. It is the largest conservatory in the world. It is substantially built as a durable structure, becoming, by arrangement with the city, a permanent feature of the Park. It is located on high ground in the midst of live-oak groves. Surmounting the center is a magnificent tower, 90 feet high, roofed with glass. Beneath this tower, in constant play, is a grand fountain. 20,000 plates of fruit, double the amount ever before displayed at any exposition, will be shown on tables extending through the hall. Around the hall will be arranged an infinite variety of rare tropical and semi-tropical plants, flowers and shrubbery. There is a tropical hothouse, 250 feet long by 25 feet wide, in which the most delicate flowers from the far South will be nurtured and made to bloom in their most brilliant perfection. Tropical fruits in the various stages of growth will be exhibited. Fruits of every section and the productions of all seasons will, by arrangements for stated supplies and thorough processes of cold storage, be available for exhibit.

The art gallery is 250 feet long by 100 wide. It is a structure built of iron. The building is an elegant and artistic structure, so arranged for mounting, accessibility and light as to present the best effects, and with ample accommodation for as large a collection as was ever exhibited on this hemisphere.

The building devoted to the large machines, or combinations of machinery for accomplishing certain kinds of industrial production is styled "Factories and Mills." It is a large iron building 350 feet long by 120 feet wide. In it will be exhibited cotton in all stages of manipulation from the boll to the bale. The newly invented "Cotton Pickers, Openers and Lappers," as well as the various and complex machinery for ginning, cleaning, baling and compressing, will be in constant operation. The supply of field cotton for this purpose will be abundant. In addition to cotton machinery this extension of Machinery Hall will contain the various kinds of machinery used in the rolling of cane and manufacture of sugar, and in the harvesting and milling of rice. Various kinds of factory and mill machinery for wood working, brick and tile making, etc., will be located in this structure. Adjacent to this building there will be a line of sawmills, extending toward the river, showing forty sawmills in motion.

It is expected that fully 20 other buildings than these shown herewith will be erected. One will be the Mexican building, which will cost about $200,000. The fair is expected to be the largest and most varied ever held in the United States. The grounds embrace the space of 247 acres, bounded on the north side by St. Charles Avenue, on the south by the Mississippi river. The buildings front east towards the main portion of the city. An electric railway encircles the ground.

PRINCIPAL BUILDINGS FOR THE NEW ORLEANS WORLD'S FAIR.

Melrose and Glendale, Montana.

Melrose, in the extreme southern end of Silver Bow county, lies on the Utah and Northern R. R., some 25 miles south of Butte City, and on the east banks of Big Hole river, which separates, in part, Silver Bow and Madison counties from Beaver Head county. The Big Hole river is one of the main branches of Jefferson river, which latter, with the Madison and the Gallatin, go to form the great Missouri. Southwestern Montana supplies the source of innumerable streams, which flow down from small and large mountain canyons, fresh from melting snows, which lie on the higher peaks of the Rocky range during nearly every month of the year. We came to the Territory in the early fall, and there has not been a day in which, with the naked eye, from some elevation, we we could not see a snow-clad peak; and besides witnessing several snow storms. We write this letter when the ground out of doors is covered with a freshly fallen crust of snow.

Melrose itself is a small railway station, with a few country stores. It has an added importance from being the jumping-off place for the extensive mining and reduction works at Glendale, some three or four miles to the northwest. At present the Hecla Con. Mining Co. is the only company operating at Glendale. They have two lead smelting water-jacket furnaces located here. Farther up the canyon—seven miles—is their concentrator, and three miles beyond this is Scow City, situated at the base of a steep mountain, which describes a semi-circle about the village, and having an altitude of 10,000 feet above sea level. Located in this mountain are the company's principal mines. Wire-cable tramways extend from the ore house at the foot of the mountain to the mines, at an angle of 35 degrees, to transport the ore. The ore is an argentiferous carbonate of lead, and assays from 12 per cent lead, with 20 ounces silver, per ton, to 60 per cent lead, with 100 ounces silver, per ton. A narrow-gauge railroad, under snow-sheds, runs from the mines to the concentrator. The ore is assorted and sacked, the high-grade going direct to the smelters and the low-grade to the concentrator. The high-grade ore and the concentrates are freigbted on wagons to the smelters. The concentrator is an excellent one, of the Fort Scott system, with the exception of the Retinger tables for fine ores. These latter were rejected after thorough trial, and the company now work their finest ores on slime jigs. Under the able management of John M. Parfit, the Glendale concentrator works 100 tons in 24 hours, losing only 2 per cent of lead in the tailings, and making a product of 50 per cent lead and 90 ounces in silver to the ton. The two furnaces smelt 55 tons of ore in 24 hours. Fifty per cent of their charge is flux and fuel, consisting of slag, iron ore, lime and charcoal, with a little coke. The furnaces are connected with an excellent dust chamber, five feet in diameter, leading into the mountain 200 feet to a smokestack, which is built up a shaft and protrudes above the surface but a few feet.

The Hecla Con. Mining Co. was incorporated under the laws of Indiana, in 1877, with a capital stock of 30,000 shares, at $50 per share par value. The works have run steadily since their construction, but paid no dividends before 1881. A flourishing little town was built up by the liberal outlay of the early management, which seemed to be reaping somewhat the benefits of the production. But since that time, under the judicious management of the present General Superintendent, H. Knippenberg, Esq., the profits have been diverted to the pockets of the shareholders, and for the last three years the company have paid monthly dividends of $15,000 per month, together with a special dividend during the past year of another $15,000. In addition to these dividends, improvements have been made to the value of $150,000, including the excellent concentrator, costing $76,000, and the railway to the mines. The stock is gilt-edge, and hard to buy in the market. Hon. Thos. Hendricks, the Democratic nominee for Vice-President, is a large shareholder in the company, and one of the directors. The officers of the company not already named are: Chas. R. Kappis, Asst. Gen. Manager; John M. Parfit, Supt. Concentrator; H. Simons, Assayer for the company. These latter gentlemen, together with James Prout, we had the pleasure of meeting, and found them agreeable and pleasant, and willing to show us every courtesy.

Academy of Sciences.

At the regular meeting of the California Academy of Sciences, on Monday evening Oct. 6th, Professor Davidson presided:

Mr. G. P. Reynolds was proposed for membership. The donations to the museum were as follows: From Commander J. W. Phillips, U. S. N., fœtus of California gray whale, a very rare specimen; Dr. H. W. Harkness, five human skulls and skulls of quadrupeds, salt from the Polish salt mines and shells from the Sandwich Islands; Wm. N. Meeks, plant and seed of the Quinoa, from Peru; Dr. Stout, vertebra of baracouta, vials containing hair from the heads of pure Hawaiians; J. W. Phillips, specimen of pseudosquilla, Anaheim; Theo. Herrmann, star fish from Monterey; R. W. Simpson, sponges from Bering Sea; J. J. Gilbert, curious concretions, or rocks from Hood's canal, W. T.

Mr. Keep, the curator of conchology made a report of progress in arranging and cataloguing the specimens in his department.

Dr. Stout called attention to the Quinoa seed presented by Mr. Meeks, describing its uses in Peru where it is cultivated as a food product instead of wheat, and stating that Mr. Meeks had raised seed in this State, and is desirous of seeing it cultivated on a large scale in California, where it will be useful.

Prof. Davidson submitted by title papers on "The Phenomena of the Satellites of Jupiter," observed at the Davidson observatory in this city during 1882-3. "Occulation of Stars by the moon, 1883." "Pons Brooks comet"—observations at Davidson observatory December and January 1883-4.

He also read notes on "Partial Solar Eclipse October 18, 1884." "Volcanic Activity of Four Island, Bering Sea," and "The Comet Wolf."

A. Wendell Jackson, of the University of California, read a description of the new mineral Colemanite, a borate of lime occurring in Death Valley, Inyo Co., California. Mr. Jackson's investigations show that the crystals of this mineral are extremely complex, upwards of thirty-five crystal forms having already been discovered upon them. Rarely a mineral so rich in crystal forms is discovered. The crystal forms were illustrated and mathematically demonstrated. Two hundred angles have been measured on the crystals by means of a large reflecting goniometer of the State University. Mr. Evans, a member of the Academy, first brought attention to this mineral, of which he made an analysis some time since. It was afterwards thought, however, that it was not new, as some of it was sent to Vienna for examination but nothing was heard of it, it having been probably lost. Recently, however, Prof. Von Rath was on this coast and some of the mineral was given to him by Mr. Jackson. He wrote the other day that he was hard at work on it. Mr. Jackson, however, has completed his investigation and sent notes of the results to *Science*, besides describing his work to the Academy. Both he and Mr. Evans are young California investigators and it is a matter of congratulation that the thorough results of analysis and the scientific examination of the crystals should have been made here before they were abroad.

NEW DIGGINGS.—Frank Pickle and William Hassel returned Tuesday from a prospecting trip in the high Sierra. They have discovered an immense ledge or series of ledges about 80 miles east of Sonora, between the Middle and West Walker rivers, on the east side of the summit. The main ledge, which they named the Tuolumne, is fully 40 feet wide of gold-bearing quartz, much of it decomposed. Ten locations were made. A cut was run into the ledge sufficient to show the extent and character of the deposit. Now, all that remains to be done to prove its value is to test the quality of the ore. Messrs. Pickle and Hassel say that the facilities for working the property are unexcelled except in the matter of transportation. There is an ample supply of timber for fuel, and timbers growing right at the mines, and water power enough to run any number of stamps. If the ore comes up anyways near expectations, the discovery is a veritable bonanza. Messrs. Pickle and Hassel have brought down about 250 pounds of the rock, which they intend having thoroughly tested by working process. Sheriff McQuade, T. M. Yancy, E. A. Rodgers, Tom Leonard and E. A. Parsons are all interested in the enterprise, and are confident that they have a big thing.—*El Dorado Mountain Democrat.*

PRINTING INDUSTRY.—In London about 62,000 persons, or an average of 1 in every 64 of the population, are engaged in the printing and kindred industries. The letter press printers number 25,595 males and 631 females; lithographers, 2,353 males and 26 females; type founders, 841 males and 6 females; bookbinders, 5,639 males and 7,293 females; copper-plate printers, 288 males and 8 females; publishers and booksellers, 3,159 males and 254 females; music printers and publishers, 600 males and 73 females; map colorers, 339 males and 129 females; news agents, 1,462 males and 311 females; stationers, 5,119 males and 2,000 females; paper makers, 880 males and 542 females; envelope makers, 135 males and 1,552 females; editors and journalists, 1,485 males and 237 females; shorthand writers and reporters, 1,000 males and 10 females.

Tintic District, Utah.

From correspondence in the Salt Lake *Tribune*, we take the following notes: Silver City is practically the terminus of the railroad, and is a prominent shipping point of ores. The town is small, being the home of miners and men connected with the mining interests. The post-office and telegraph-office is managed by C. H. Blanchard, Jr., who appears to be a very useful man, as he is also a notary public.

From Silver City to Eureka it is five miles, the road circling around the mountain, making a half circle. A stage line, operated by Walter Gardner, makes trips to connect with all trains, and extends to Homansville three miles beyond Eureka.

The Mines.

Commencing at Eureka, which is central to the district, we find much activity in mining, and an excellent outlook for the future of the camp. During the past two years this place has developed much, and the chief mine, the Eureka, has become one of the great mines of the Territory. It is well equipped with machinery for present service, and more is to be added. It has a good hoisting engine, a Burleigh air compressor to operate air drills, pumps, etc. A depth of nearly 600 feet has been obtained, and what is very important, the vein grows larger and better as they descend. In the upper workings there was milling ores, while in the lower it is lead silver, just such as is most desirable for smelting. In the early history of Tintic there was great anxiety regarding the depth to which mines would pay, and it was generally believed that the veins did not go down far. The Eureka and Crismon Mammoth have shown that the ledges improve to the depth of 600 feet, and it is reasonable to expect the same favorable results as they go down. There are several good prospects in the district, which only need capital—if we may judge from the upper workings—to make good mines. The Eureka works from 150 to 275 men, and is sending out about 75 tons of ore per day, which is shipped to various points. This ore goes about 20 per cent lead, and 30 ounces silver, and is in such large bodies, and so easily mined and shipped as to make it one of the great properties of Utah. John McChrystal is superintendent, J. Q. Packard president and general manager of the company, Paul Schettler secretary and treasurer. The mine is most splendidly timbered, and operated throughout. Besides working through the 600-foot shaft, they are running a tunnel to the top of the ledge, and are in now over 400 feet. Progress in this tunnel is slow, because of the hard blue lime, but the tunnel is large, and one of the best we ever saw.

The Bullion.

The Bullion, better known as the Beck, below the Eureka, is working 52 men, and is shipping about 35 tons of ore per day. A depth of 250 feet has been obtained, and immense chambers of ore have been taken out, while on every hand there remain large bodies ready to be removed. This ore goes on an average 27 ounces silver and 16 per cent lead. Like the Eureka, there is an improvement in both quantity and quality of ore as they go down. Rich pockets have been found, which yielded ore running up into the thousands. John Beck, the owner of this property, is doing much for the district in the way of improvements and his various enterprises. Dennis Sullivan is superintendent of the mine.

The Tintic M. & M. Co.

The Tintic Mining and Milling Company are operating the Northern Spy and 400 feet of the Carrissa, making 1,900 feet of ground. This property is located in the same mountain as those described, but on the east side, and has been opened up during the past four years. Alex. Graham is the manager of this property, and, considering the time, the work has been quite extensive. The ores are part milling and part lead-silver, carrying gold in large percentages. The shaft has been sunk to 400 feet, to test the mine, and ore was found all the way down. But little drifting has been done as yet, and the most of the workings are in the upper levels. Recently a very fine strike of ore was made on one of the levels, the body of ore being very large, consisting of lead, silver, carbonates, with but little galena. The company is working twenty men in the mine, and when the mill is operated will work twenty more men.

The Iron Mines,

Located near Silver City, are operated by the Utah Forwarding Company, with L. E. Riter as superintendent. These mines are shipping from 50 to 100 tons of ore per day to the smelters in Utah and Idaho. This ore is classed as the very best fluxing ore in the country.

The Carrissa.

This property, which is 10,000 feet long, belongs to B. Roberts and others of Salt Lake. Recently they have put down a shaft within a few feet of the south end of the workings in the Northern Spy, striking ore of a high grade at 35 feet from the surface. The vein is at least 10 feet wide. It has only been two months and a half since they began work, and already they are shipping ore. The vein is the same as the Northern Spy, and so situated that both properties could be well worked as one.

The American Eagle is just east of and adjoining the Crismon Mammoth, is the same vein and character, and promises to come to the front soon. At present only a few men are employed.

At Diamond the mines are lead, mostly owned by poor men who are not able to operate them, especially as water is near the surface. The Sunbeam, heretofore valuable in the upper workings, is lying idle from this cause. This is the only vein in this district in granite, and experts say it is the best defined of any.

Crismon Mammoth.

Last but not least is the great Crismon Mammoth property, which is lying idle. We need not at this time enter into the details of the history of this property, as it is well known to the readers of the *Tribune*. Suffice it to say that when it was closed down one year ago, 300 men were thrown out of employment, and ever since the mine and the great smelting plant have lain idle. Soon the property is to emerge from its difficulties, if we may believe reports, and become an extensive institution, which will again people the district with hundreds of miners and smelting men. With all the adverse circumstances surrounding Tintic, it has a big ore output. One-half of the mines are idle, and yet there is shipped ores to the amount of about 150 tons for every day in the year, if we include the shipment of iron ore with the lead-silver ores. This certainly is a good showing, but it ought to be two or three times as great. In 1883 the iron ore shipments amounted to 18,000 tons, while the lead-silver ore shipments aggregated about $900,000 in value. The latter will be double for 1884, while the iron shipments will be about the same. Colorado iron ore has come into competition, and affects shipments here to quite an extent.

The Lost River Region.

A gentleman who recently paid the Lost River country a visit furnishes some interesting news from that section. Ranches in the Big and Little Lost River valleys are fast being taken up by industrious farmers, though as yet the country is but sparsely settled. Every farmer has at least a small patch of grain that his yielded abundantly, and the oats crop was especially good.

The Lost River mining district is making a good showing this season, and promises at no distant day to rank among the leading base-metal producing sections of the Pacific slope. Some of the prospects already developed show every evidence of permanency, and some of the ore produced is of a high-grade, yielding several hundred dollars in silver to the ton.

The Daisy Black, in Hamilton district, beyond Little Lost River, may be taken as a fair average of the mines in that region. The lead is about eight feet by ten, and the ore from face to face will average about 40 ounces of silver and 50 per cent lead to the ton; while small veins through the ledge will assay well into the thousands. The wall-rock is lime and white sandstone. In fact, the mining section of that region seems to be generally of a lime and sand formation, and the ledges of ore-producing rock are well defined and may be traced for miles between these walls. The cost of mining is almost inconsiderable, compared to most sections of the country, and this fact alone will greatly enhance the value of the properties. In several instances experienced men have offered to contract to take out ore from some of the prospects at the rate of $2 per ton, but owners have not been developing their properties, as they are awaiting the arrival of the smelter, which will be in operation now in a few weeks.—*Wood River Times.*

Soda Springs Bubblings.

A. G. McAfee is busy, getting the Eva mine in readiness for work.

Rhodes' marsh, south of here, is shipping considerable salt and horax. About 15 men are employed at the works, and a small army on the marsh.

Mining and milling men and contractors have been paying frequent visits of late, and the rumors in relation to the new Mount Diablo mill at this place are many.

Archie Farington made his first bullion shipment from the new mill last Sunday. There were four bars, valued at $5,600. The mill has five stamps, and is said by experts to be the most complete ever built. It requires only four men on a shift to run it, as the work is almost entirely automatic. The ore goes through the drier, battery, roasters and pans without ever being touched, except by machinery. The bullion is very clean and bright looking, and is 824 fine.—*Walker Lake Bulletin.*

PELTON WATER WHEELS. — The demand throughout this and foreign countries for the Pelton water wheel (a Nevada city invention) continues to increase right along. They are being manufactured in large numbers at Geo. G. Allan's foundry on Spring street. One of 75 horse-power and 5 feet diameter has just been sent to Auckland, New Zealand, where it is to be used by Messrs. Frazier & Tinne in running a twenty-stamp quartz mill, pans, rock-breaker and other machinery. One with a double nozzle and capable of giving 300 horse-power is being made for use in San Francisco. A three-foot wheel is to be put into the Eureka Lake Company's saw-mill at Columbia Hill to run the machinery there.—*Nevada Transcript.*

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WATER MOTOR.—James H. Culver, S. F., assignor of one-half to W. H. Wiester. No. 305,575. Dated September 23, 1884. The invention consists in a novel construction of a wheel and buckets which can be stamped from a single sheet or plate, a means for mounting it within a case to prevent leakage around the shaft, and a means for supplying water to drive the wheel, together with certain details of construction.

WRENCH.—Benton Elmore, Etna, Siskiyou Co. No. 304,807. Dated Sept. 9, 1884. This invention relates to that class of wrenches in which the approach and separation of the jaws are dependent upon the movement of the handle, and whose bite or grip is proportionate to the pressure wrought upon the handle. The invention consists in the arrangement and connection of the jaws with each other, and of both with the handle. The object is to provide an effective and easily operated wrench.

CABLE RAILWAY CARS.—Henry Root, S. F. No. 304,863. Dated Sept. 9, 1884. This invention relates more particularly to a track brake for cable cars. These cable cars have ordinary brakes on the wheels but track brakes are necessary also. Owing to the peculiar construction of the running gear on the cars of the Market street road in this city, Mr. Root devised details of construction of the track brake and its connections, which this patent covers.

SULKY-CULTIVATOR.—Wm. H. Roberts, Santa Clara, No. 304,861. Dated Sept. 9, 1884. The improvement in sulky-cultivators consists in a single bead or bar to which the grove-neck or stems of the teeth and pole or shafts are received; in the rigid connection between it and said parts; in the arrangement in connection therewith of a crank axle and the scat, and in a smoothing drag-board attached to the head. The object of the invention is to provide an easily handled cultivator adapted to be operated by one or two horses, and to be fitted readily with various forms of teeth.

VELOCIPEDE.—Robert B. Lunsford, Oakland. No. 305,698. Dated Sept. 23, 1884. This velocipede consists in a wheeled frame carrying a seat or chair, and a peculiar foot lever pivoted to the frame behind the rear axle, and extending over and down in front of said axle, being connected with and driving the axle and wheels by means of pitmen extending from said levers to cranks on the axle. The connection between the frame and the front axle, the means of guiding, the seat, the treadles and the draw-bar form details of construction of the inventor.

METAL SHEARING MACHINE.—Robt. I. Knapp, Half Moon Bay, San Mateo Co. No. 304,829. Dated Sept. 9, 1884. This apparatus for cutting plates or bars of metal consists of a combination of devices. The usual method of cutting steel or iron is by means of power or hydraulic shears, which operate with a slow motion and under great pressure. In this apparatus Mr. Knapp employs the momentum of a falling or steam driver weight, carrying one of the shear blades so that it passes the other which is stationery and upon which the plate to be cut may be held.

DEVICE FOR TURNING VEHICLES OUT OF CAR TRACKS.—Theodore H. Macdonald, S. F. No. 305,610. Dated September 23, 1884. This is a device by which the wheels of vehicles may be easily directed out from the channel in street-car tracks where they have been traveling, this being effected without straining the wheel. It consists of a plate, supported by a radial arm or mechanism surrounding the hub of one or more of the wheels. The plate projects beyond the face of the tire or rim of the wheel, and at a little distance from it when out of action, but in such a position that when turned down the wheel may run over it, and it raises the wheel at the instant that the turn is made, so that it is lifted out of the channel in the car-track, passing on to the other portion of the road-bed without injuring the wheel.

GRINDING PAN.—George H. Malter, S. F., No. 304,700. Dated Sep. 23, 1884. This grinder consists of a pan with vertical sides, having a ring or die fixed around its inner periphery, a series of shoes loosely supported upon muller-plate, which is rotated by a central shaft, and has vertical partitions between which the shoes lie, a feed hopper and a deflector within the pan, means for supplying the water and for regulating the discharge. The muller-plate is driven from a central shaft and has its upper surfaces subdivided by tangential partitions. The shoes lie within the spaces thus formed, and are thrown outward by centrifugal force, so as to grind the ore-pulp between themselves and the ring-die. The ore is admitted through a hopper and the center of the pan, and delivered upon a deflector to distribute it outwardly toward the circumference of said pan. In dry crushing, the ore discharges below, and in wet crushing through an opening near the top of the pan.

ENGINEERING NOTES.

Aerial Navigation.

Late experiments under the authority of the French Academy of Sciences appear to give some encouraging evidence that a material advance has been made in the science of aerial navigation. Two French officers, Captains Renard and Krebs, attached to the military balloon workshops at Meudon—if we may trust the circumstantial narration of their experiments, given upon what appears to be most respectable authority have at length succeeded, with the use of a steering mechanism and a screw propeller driven by an electo-motor, of four horse power, which was actuated in turn by the energy developed from a secondary battery, in devising a method whereby a balloon may be navigated in any direction at the will of the aeronants. The details of the experiment in question indicate a decided advance in this field of investigation, and promise to be followed by results of prime importance.

According to the accounts given, the full details of which have been placed before the French Academy by M. Herve Mangon, with the approval of the French Minister of War, at 4 o'clock of the afternoon of the 9th of August last, a balloon, provided with the mechanical devices and motive power above described, and carrying within it as passengers the two officers named, rose from the park at Choisy, near Meudon. The air was calm, and at first the movement of the balloon was scarcely perceptible; but as soon as its motive power was brought into action its pace was accelerated. When it was some two miles from Meudon, the spectators saw it suddenly tack about, make a half circle of 300 yards radius, return to its point of departure, and slowly descend with a dipping motion, until it alighted on the lawn from which it started. The distance covered in going and returning was about four miles and three quarters, and the time occupied in the trip 27 minutes. During the entire trip the balloon is said to have obeyed faithfully the least movement of its helm. The total weight of the balloon, with all its appliances, including the two officers who controlled and directed its movements, was 4,250 pounds. The duration of the force employed in working the screw propeller was estimated at four hours when the full power of the battery was applied. Only a little more than the power of three horses was used on the occasion referred to.

The respectability of the testimony in favor of the correctness of the foregoing account is so unquestionable, that we may safely assume the facts to be substantially as narrated. It would, therefore, appear that, so far as relates to the question of guiding the course of a balloon in any given direction, and to any desired point, to reverse its course and return to the point of departure on a calm day, the experiment of Captain Renard and Krebs at Meudon is conclusive.

The value of the balloon as an auxiliary in modern warfare was fully demonstrated during the siege of Paris, and its future value as a means of conveying intelligence to distant points under similar circumstances, must be immensely increased by the ability to control its course, which the Meudon experiments demonstrated to be practicable. Whether the development of the experiments shall introduce into this method of transportation enough of certainty and safety to make it available for the arts of peace remains to be seen. Let us hope that it may be so. However this may be, the Meudon experiment indicates that the world has entered upon a new era in the history of aerial navigation.

The inventor of this navigable balloon is Captain Renard, who claims that only time and money are now needed to bring this new route into practical use. He says he can construct a balloon which will easily carry one hundred persons in any direction, and that he could insure a balloon postal system as efficient as that of the railroads. The subject of aerial navigation is also receiving the attention of intelligent parties in this country, and it will hardly do now if the powers of the air cannot be overcome by the inventive genius of this wonderful age.

THE STEEPEST RAILROAD GRADE.—Much has been written about the construction of the mountain divisions of the Denver and Rio Grande railroad in Colorado, and the wonderful engineering skill displayed in ascending the California mountains south of Tulare valley, through the Tehachapi pass. But, according to the *Leadville Chronicle*, the little feeder of the Leadville division of the Rio Grande exceeds all other roads in its steep grades and short curves. When the line first went into operation many accidents occurred by the trains breaking away at the top and running back down the steep grades, wrecking locomotives and cars and destroying limbs and sometimes lives. Later, however, extremely heavy locomotives have been built and the most skillful and the bravest train hands employed, who never flinch in the supremest moment of danger. The result has been that accidents now seldom occur. It is said that the sight of one of these trains descending is one of thrilling interest, the sparks from the car wheels cutting a pathway of light down the mountains, which can best be described as having the appearance of a molten stream of fire rushing down to the river-bed of the canyon.

USEFUL INFORMATION.

A Soft Alloy.

A soft alloy, which attaches itself so firmly to the surface of metals, glass and porcelain that it can be employed to solder articles that will not bear high temperature, can, as the Pharmaceutical Record asserts, be made as follows: Copper dust, obtained by precipitation from the solution of the sulphate by means of zinc, is put in a cast iron or porcelain lined mortar and mixed with a strong sulphuric acid, specific gravity 1.85. From twenty to thirty-six parts of the dust are taken, according to the hardness desired. To the cake formed of acid and copper there is added, under the constant stirring, seventy parts of mercury. When well mixed the amalgam is carefully rinsed with warm water to remove all the acid and then set aside to cool. In ten or twelve hours it is hard enough to scratch tin. If it is to be used now, it is to be heated so hot that when worked over and brayed in a mortar it becomes as soft as wax. In this ductile form it can be spread out on any surface, to which it adheres with great tenacity when it gets cold and hard.

A CHINESE FARM HOUSE is a curious looking abode. Usually it is sheltered with groves of feathery bamboo and thick-spreading banyans. The walls are of clay or wood, and the interior of the house consists of one main room extending from the floor to the tiled roof, with closet-looking apartments in the corners for sleeping rooms. There is a sliding window on the roof, made of cut oyster shells, arranged in rows, while the side windows are mere wooden shutters. The floor is the bare earth, where at nightfall there often gathers together a miscellaneous family of dirty children, fowls, ducks, pigeons, and a litter of pigs, all living together in delightful harmony. In some districts infested by marauding bands houses are strongly fortified with high walls, containing apertures for fire-arms, and protected by a moat, crossed by a rude drawbridge.

COPPER FOR ROOFING.—We have already in these columns, referred to the economy of copper for a roofing material. An architect speaks upon the subject of the relative economy and benefits of copper over tin, as follows: We always specify the use of copper for covering roofs, when we can induce owners to allow us to do so, on account of its durability; although its cost is about $14 per 100 square feet over price of tin roofing. But when we reflect that a tin roof requires constant repairs, and painting at least every two years, at a cost of two to three cents per foot, varying as to the number of coats, the cost of repairs for six years, together with the cost of tin roof, equals the cost of copper.

A CURIOUS BAROMETER is said to be used by the remnant of the Araucarian race inhabiting the southernmost province of Chili. It consists of the cast-off shell of a crab, which from its curious application, is called the "Barometro Araucano." The dead shell is said to be extremely sensative to atmospheric changes, remaining quite white in fair, dry weather but indicating the approach of a moist atmosphere by the appearance of small red spots, which grow both in number and in size as the moisture in the air increases, until finally, with the actual occurrence of rain, the shell becomes entirely red, and remains so throughout the rainy season.

THE first patent granted to an inventor in the United States is mentioned in a speech of ex-Senator Wadleigh, of New Hampshire, in the forty-fifth Congress. The senator said: "An intelligent gentleman of my own State has referred me to an Act of the general court of Massachusetts Bay, passed in 1646, granting to one of his ancestors, Joseph Jenks, the exclusive right of making and selling his improved scythe for the term of fourteen years. That, I think, was the first patent granted to an inventor in America. The improvement referred to changed the short, thick, straight English scythe into the longer, thinner, curved implement with stiffened back now in use."

LIQUID BLACKING, or more properly speaking the "liquid gloss," which is much used for ladies' and children's shoes may be easily made by any one, as follows: Take ivory black and molasses, of each one pound, sweet oil and sulphuric acid, of each four ounces. Rub together the first three until the oil is perfectly killed, then gradually add the sulphuric acid, diluted with three times its weight of water. Mix well and let it stand for three hours, when it may be reduced to a proper consistency with water or sour beer.

ROLLED GOLD.—Everybody is familiar with the "rolled gold" jewelry now so abundant in the shops, which are so beautiful in design and workmanship, and so remarkably cheap. It is made by forming a thin layer of gold alloy upon an ingot of brass while it is hot. When this ingot is cool it is forced between steel rollers into a long, thin ribbon, each part of which is of course still covered with the gold alloy, incalculably thin, but which will wear for several years and can be molded into any shape.

IMPROVED METHOD OF JOINING LEATHER BELTS.—Some party has devised an improved method of joining leather belting, which dispenses with stitching and riveting overlapped bands, all that is required being merely to slit the ends of the bands into eight or ten "fingers" and dove-tail them on a long single rivet, or small bolt. This is readily done with a combination tool which has been made for the purpose, and the result has several advantages apart from the saving of time in stitching.

NATURAL GAS IN WASHING.—I will state here that the discovery that natural gas "cuts grease" in clothing, etc., without at all injuring the fabric was accidental. Further experiments in this line would be desirable. How easy wool could be washed after this treatment, clothing cleaned, mail bags and rooms disinfected. Some one will strike a bonanza in applying this gas in this way yet.

EDUCATION IN EUROPE AND AMERICA.—Our system of public education requires an annual expenditure of nearly $98,000,000, only a few millions less than all the nations of Europe devote to the same object. Yet it is a fact that Great Britain expends two-thirds more than that immense sum upon her army and navy.

A VALUABLE INVENTION.—An engineer in Michigan has invented an attachment to steam cylinders which condenses the waste from the steam cock on starting the engine. It does away with the hissing noise which frightens horses and worries men. The engineer has been offered $47,000 for the patent.

COLD AND WARM-BLOODED ANIMALS.—There is less blood in cold-blooded than in warm-blooded animals. The larger the animal the greater is the proportion of blood to the body. Man has about a gallon and a half of blood, equal to one-thirteenth of his weight.

POWER IN TURNING SHAFTS.—If a four-inch and a two-inch shaft are both solid, and each makes 100, or any other given number of turns, in one minute or other specified time, six times as much power will be consumed in turning the larger as in turning the smaller shaft.

LUMINOUS water-proof paper may be made from a mixture of forty parts pulp, ten parts phosphorescent powder, one part gelantine, one part potassium bichromate, and ten parts of water. It can often be used where luminions paint cannot.

BLACK VARNISH FOR IRON.—To make a good black varnish for iron or other metals, dissolve by heat three ounces of asphaltum, four quarts of boiled oil, and eight ounces of burnt umber. Mix the compound with turpentine while cooling.

GOOD HEALTH.

How to Remove Scars.

Scars are always unsightly, and are often painful or inconvenient, on account of their propensity to contract as they become older. Dr. Wark, of New York, asserts that they may be removed by manipulation, which he directs to be employed as follows: Place the ends of two or three fingers on a scar if it be a small one, and on the margin if it be large, and vibrate the surface on the tissues beneath. The surface itself is not to be subjected to any friction; all the motion must be between the integument and the deeper parts. The location of the vibratile motion should be changed every 10 or 15 seconds until the whole scar has been treated, if it be of moderate size. If the scar be the result of a large scald or burn, the margins only should be treated at first; the advances toward the center should be deferred until the nutrition of the margins has been decidedly improved. Only a little treatment should be applied to any one spot at the same time, but the vibrations should be repeated as many as 20 times a day, but never with sufficient frequency or severity to cause pain. If the scar becomes irritable, suspend treatment until it subsides. In the course of two or three weeks of faithful treatment, the surfaces of the scars of moderate size becomes more movable, and will begin to form wrinkles like true skin, when pressed from side to side. All these changes are due to improved nutrition, consequent on better blood circulation—the development of entirely new sets of blood vessels in the cicatricial tissue.

TO REMOVE SUBSTANCES FROM THE EYE.—Dr. C. D. Agnew, in the *American Practitioner*, says that before applying any metallic to the human eye, practitioners or others should use an instrument made in the following manner: Take a splinter of soft wood, pine or cedar, and whittle it into the shape of a probe, making it about the length of an ordinary dressing probe. Then take a small, loose flock of cotton, and laying it upon your forefinger, place the pointed end of the stick in the center of it. Then turn the flock of cotton over the end of the stick, winding it round and round so as to make it adhere firmly. If you will look at the end of such a probe with a 2in. lens you will see that it is quite rough, the fibers of cotton making a file-like extremity, in the midst of which are little interstices. As the material is soft, it will do no harm to the cornea when brushed over its surface. When ready to remove the foreign body, have the patient rest his head against your chest, draw the upper lid up with the forefinger of your left hand, and press the lower lid down with the middle finger, and then delicately sweep the surface in which the foreign body is imbeded, with the end of the cotton probe. When the foreign body is lodged in the center of the cornea, it is most important not to break up the external elastic lamina; for if you do, opacity may follow, and the slightest opacity in the center of the cornea will cause a serious diminution in the sharpness of vision.

DANGEROUS DYES.—An authority on the subject of skin disease, Mr. James Startin, M. R. C. S., has sent a case of exhibits to the Health Exhibition which illustrate the danger of wearing next the skin articles of clothing dyed with substances obtained from benzol and other products of coal tar. That danger has been pointed out many times by medical men, who have given instances of the ill effects caused through the absorption by the skin of these irritating and poisonous compounds. Mr. Startin repeats these warnings, by showing specimens of some of the beautiful aniline colors, rosaniline, magenta, violet red, methy violet, Bismarck violet, etc., and gloves and stockings dyed with the substances by which these hues are obtained, through which, in cases coming under the treatment of the exhibitor, eruptious on the skin of women and children, in some instances of a very severe character, have been produced. In the same case are shown many vegetable dye stuffs, from which no such danger need be apprehended.

SCIENCE AND HEALTH.—Although science has not yet robbed consumption of its terrors, the discovery of the so-called bacillus of tuberculosis has already pointed out to medical men a possible means of saving the lives of many patients. Speaking recently in Paris, Prof. Germain See dwelt upon the importance of searching for this organism in the matter expectorated by persons having apparently slight lung troubles. He regards its presence as an unfailing sign of consumption, for the most careful research has failed to detect it in other lung affections; and as it may be found before the appearance of other symptoms, it may enable the physician to successfully apply treatment in the early and curable stages of the disease.

A DOLL THAT HAD DIPHTHERIA.—The Board of Health of Amsterdam, N. Y., have recently investigated an outbreak of diphtheria, from which two children died, a third, who was attacked, recovering. The disease was traced to a pet kitten, with which a little girl played while the animal was sick with a swollen throat and discharge from the nose. The cat died. The child was taken sick and also died. Another girl played with a doll which had belonged to the deceased child; she was also taken sick and died. Still another contracted the disease without other means or communication than the doll. The latter was supposed to have been disinfected.

DEATHS AT DIFFERENT AGES.—A statistician, Dr. Farr, we believe it was, recently stated that if one could watch the march of 1,000,000 people through life, the following would be observable: Nearly 150,000 would die the first year, 53,000 the second year, 28,000 the third year, and less than 4,000 in the thirteenth. At the end of forty-five years 500,000 have died. At the end of sixty years 370,000 would be still living; at the end of eighty years, 97,000, at eighty-five, 31,000; and at ninety-five years there would be 223; at the end of 108 years there will be one survivor.

CANCER IN ANIMALS.—A writer in the *Jour. Comp. Med. and Surg.* has been investigating the above subject, and describes numerous cases of undoubted malignant disease in lower animals. Of the cases observed, there was in fowls, a chicken, an old hen whose foot had been frost bitten, and a capon. Five cases in horses and mules and one each in a cow and a dog were unmistakably malignant. The fact is also referred to by the writer that pigs are very subject to intestinal tumors and suspicious glandular enlargements.

A STRANGE APPETITE.—An English girl was incommoded by a huge lump in her stomach, which was presumed to be the result of a morbid appetite for hair combings and cotton wool, which she had gratified without stint. Dr. Knowlsley Thornton, the eminent ovariotomist at the Samaritan Hospital, London, made an opening into the stomach, and extracted a large mass of cotton and hair molded into the form of the stomach, and measuring nine and one-half by five inches. The patient was doing well at last accounts.

GRAHAM AND WHEAT BREAD.—From experiments made upon himself, a French savant concludes that contrary to the generally received opinion, whole meal bread, or that containing all the ingredients of the grain, is less wholesome and more indigestible than pure white bread made of the flour alone.

FEMALE PHYSICIANS. — Twenty years ago there were but twelve women doctors in the United States. There are now over eight hundred.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Oct. 11: The Downs mine has closed down for a time, on account of the illness of R. C. Downs. The prospects were considered good when operations were suspended. The repairing of the Amador sulphurets works is almost completed. A fire will be started in a few days for the purpose of drying the ovens, which will take about a couple of weeks to get them ready for work.

MISCELLANEOUS.—At the Morgan claim in Hunt's gulch connection has been made between the tunnel and shaft. A substantial dwelling and boarding house has been erected near the site of the one destroyed by fire last year. The cost of this structure will be from $1,500 to $2,000. The Manimoth mill was started up Thursday morning.

Calaveras.

NOTES.—*Mountain Echo*, Oct. 11: There is a strong probability of the Invincible mine changing hands in the course of a week or two. Several laborers are engaged in grading off a place on the Stickle's mine, preparatory to erecting a mill and hoisting works. We are informed that a Mexican who has been working on French gulch, recently unearthed a piece of quartz that contained $240.

Kern.

KRAMER MINES.—Calico *Print*, Oct. 11: Judging from the reports that we have recently heard from the mines near Kramer station, 40 miles west of Daggett, in Kern county, there is likely to be a good mining camp established there. We had an interview with J. L. Coffman, one of the owners of those mines, who reports that these prospects in that vicinity are fine and as encouraging as could be expected under the circumstances. We have received a small collection of specimens of copper and galena ores that assay bigh in silver, that came from a half dozen of these mines. Most of the work accomplished so far bas been done by Kilgore, Hewett & Co., who own ten locations, but little work has been done on them besides surface prospecting, excepting the Kramer and Belden. A shaft 40 feet deep has been sunk on the Kramer, and the ledge widens as they go down, and the ore carries a greater percentage of silver than it did near the surface. At this depth the ledge is six feet wide. The shaft on the Belden is down ten feet, and the ledge is eight feet wide. J. L. Coffman and J. R. Maxey are interested in a number of claims including the 'Little Wonder,' Central, Coffman and Maxey. These gentlemen feel confident that these mines can be developed into as fine properties as any others in this desert. The other day Mr. Maxey found a fine ledge of galena that assays high in silver. Some of the ore taken from the above mines contains considerable red oxide, and several small bars of silver have been made from the same by melting the mineral in a common furnace. These mines are about five miles south of Kramer railroad station, and there are about 40 locations. Water has been found within about two miles of the mines in two places, and it is thought it can be found in other places at a depth of about 20 feet. Several buildings have been erected near the mines. A mining district will soon be formed there.

Mariposa.

SNOW CREEK.—Cor. Mariposa *Herald*, Oct. 11: The prospect in mining is still encouraging. First may be mentioned the Grove Bros. & Co.'s mine. The accident of breaking their pump did not cause any serious trouble, but every thing was soon repaired. They have now a three-foot vein of excellent quality. Ward & Co. are running a tunnel to tap a group of veins lying parallel and which prospect well but are too wet to sink any deeper without hoisting machinery, and tunneling is cheaper. James Hall is erecting a mill on Snow creek for his mine the "Vanderbilt;" of course he knows that he has enough in sight to warrant the outlay. Green & Marsh are also sinking a shaft about a mile from the head of Sweetwater (south) and have a two ft vein of an excellent quality. They are down about 45 ft. It contains very rich sulphurets. It may be expecting too much to think that all these veins will pay but the chances look favorable at present.

SWEETWATER MINE.—Cor. Mariposa *Gazette*, Oct. 11: Upon arriving at the "Golden Age" owned by the Messrs. Grove, we were met and conducted through the mine and mill and I was told that they had reached the depth of 130 ft, with an 18 inch vein and favorable prospects. The mill is a 10 stamp, steam-power, substantially constructed and conveniently situated near the mine. Among the mines worthy of mention in that vicinity, are the "Early," "Mountain View" and "Union" owned by Messrs. Rice and Ferguson. They are at present engaged on the "Early" mine and the shaft is now 100 ft deep. The "Mountain View," has a 260 ft tunnel both mines show encouraging indications. Tbeir 8 stamp mill, which has just been completed a short distance from the mine, is acknowledged to be one of the most compact and neatly built mills in the county. It is now running night and day, crushing rock from the "Early" mine. The Revere Brothers are having rich ore taken from their mine on Sweetwater and crushed at the Grove mill. The situation of the mines on Sweetwater, afford the owners an opportunity of working them economically, there being an abundance of timber and water near by. Messrs. Todd & Ward, are busily engaged in prospecting several mines north of Snyder & Co.'s saw mill. They give employment to several miners, and have recently constructed an eating house with a view to boarding their men, and themselves, having heretofore patronized the Ferguson hotel. This company have spent considerable money in developing mines in this section. Under the management of Mr. J. H. Hall the new work on the Mt. Buckingham mine mill, is progressing rapidly. The machinery for a new 10 stamp mill has recently arrived from below, and is on the ground. This mine contains a vast body of ore already exposed and known to be of a paying quality. Quite a number of laboring men and miners are already employed, which number will be largely increased as soon as the mill is ready to crush. In the same neighborhood is the Banner mine, owned by Messrs. Green & Marsh. It was discovered by Mr. J. Green sometime back, who finding it was probably rich, covered it up for the time being, and until recently but little has been known of the supposed rich find. They have lately sunk a shaft 40 ft deed, and are very much encouraged with the prospect. This mining section, which extends over a reasonably large area of country, is yet comparatively new and unprospected for minerals. The chances are quite favorable that, by the time another year rolls around the dearth of mining interest and successes which has prevailed in other portions of the county will be made up for, by the developments which are yet to arise in this new section.

Nevada.

THE AGNES.—*Foothill Tidings*, Oct. 11: This mine is the old Lucky, situated on Union Hill. The old Lucky in former days made some of our citizens quite independent—considerably ahead of the world. Then the old Lucky stopped, or it was supposed that she had stopped. But now under the name of the Agnes she is doing well and promising to do more. Joseph O'Keefe and John Steele are working the Agnes, and last Friday they had a crushing finished at Joe Southern's mill. The crushing was 14 loads of rock (say 21 tons) and the yield was $922.36 in gold, or close on to $66 a load. A lot of heavy sulphurets is to be yet worked. The Agnes ledge is a strong two-footer, with the formation and all surroundings just right for a good mine. In about four weeks another crushing will be had of the Agnes ore.

PENNSYLVANIA MINE.—The Pennsylvania mine will be started up right away, negotiations to that end having been completed last evening. George Mainhart, one of the best practical miners of this district, will be the director of the working organization. The Pennsylvania is one of the mines that the Menlo Company of New York had bonded some three or four years ago, but the Menlo speculated more than it worked mines, and some of the Menlo men did worse than speculate, and so that company failed. Since the bonding to the Menlo and until now the Pennsylvania has been idle, but now the mine is in the hands of workers and not speculators. The incline on the mine is down over 300 ft and drifts have been run on the lode and all show a strong vein of good-milling ore.

MORE INJUNCTIONS.—Grass Valley *Union*, Oct. 11: It is rumored that the anti-debris people, not content with obtaining injunctions against the hydraulic mines, are now going after the drift mines on the strength of the Sawyer decision, which forbids the fouling of the public streams by mining operations; and as an evidence there is truth in the report we received information yesterday that the gravel mill of the Birdseye Mining Company, at You Bet, was shut down on Monday, on the strength of a dispatch received from San Francisco and nearly all the employees of the company discharged. This company was not engaged in hydraulicing, but breasted out the gravel and run it through a stamping mill. Of course water was used in the batteries in the same manner as in quartz mills, and the tailings necessarily carried a considerable amount of sediment, and for that reason such mining may be said to have come within the purview of the Sawyer decision. The same may be also said of quartz mining, although the anti-debris men have been persistently declaring that they intended no interference with drift or quartz mining. If the Birdseye mine has been shut down on threat of an injunction suit it goes in proof that all mining stands in jeopardy of being annoyed and harassed by the irreconcilable anti-miners of the valley regions.

PEABODY MINE.—Quartz of extraordinary richness was struck in the Peabody mine, yesterday. Some of the pieces of quartz were nearly half filled with gold, and besides there were a number of pieces of solid leaf gold that broke off the quartz as it was taken out. The gold had the rusty appearance of the gold that was characteristic of that formerly taken from the Gold Hill ledge, of which the Peabody is considered the extension. The vein where this gold was found was from four to five inches in thickness, and the depth about 180 ft from the surface on the incline. The ledge from which it was taken has also the dip of the Gold Hill vein. The owners in the Peabody feel greatly elated over this rich prospect, and they certainly have great reason to be.

TWO MINES BONDED.—*Transcript* Oct. 11: About three weeks ago a gentleman arrived here from San Francisco. For several days he examined a great many mines and at last he bonded a quartz mine on Gold Flat for $6,000, and has commenced active work upon it. A tunnel is being run. This gentleman has also bonded a gravel mine near the Central house, on the Washington road, and has put men to work on it. He left here on Saturday last for San Francisco, and will thence proceed to New York, and return here again within six weeks, at the end of which time the work on the claims will be so far advanced for he can determine whether or no he will take the properties. In the bonding of these mines he has used his own judgment and believes he has good properties.

WILL START NEXT WEEK.—The repairs of the damage done last winter to the sluices of the South Yuba River tunnel mine, at Hoyt's old crossing, are being pushed ahead as rapidly as possible. Four teams are hauling blocks, which are being put in as fast as they are delivered, and Supt. Emery thinks everything will be completed by Saturday night. Next week the work of mining in the river bed for course gold (of which there is supposed to be a great deal scattered through the gravel) will be begun.

MARYLAND MINING COMPANY.—*Tidings*, Oct. 9: The Maryland mine is on the famous Idaho lode, and the Maryland ground joins the Idado ground on the east, with the pay chute pitching into the Maryland. Last Monday the stockholders of the Maryland met and elected the following directors: S. P. Dorsey, John C. Coleman, Edward Coleman, Samuel Bethel and Stephen Moore. As president of the board and superintendent of the mine S. P. Dorsey was chosen, with Samuel Bethel as secretary and treasurer.

San Bernardino.

BONANZA KING MINE.—Calico *Print*, Oct. 11: We have obtained from a reliable source the following brief summary of the results of developments in the Bonanza King mine, of Providence, in this county, about 100 miles east of here. Under the able management of Thomas Ewing, General Superintendent of the mill and mines of the Bonanza King Con. Mining Co., this mine is making a better record than any other silver mine in California. The Bonanza King mine has been, and is, the greatest mine in San Bernardino county. It has yielded more and finer bullion, been better opened, better worked, and obtained greater results from the ore than any other mine in this great mineral desert. The ore at the deepest opening is as free and as rich as it was at the beginning. The mill has saved an average of the fine assay of pulp of over 89 per cent. for all ore crushed. 13,000 tons of ore have been crushed with their ten stamp mill, and the tailings average less than $13 to the ton. Nearly $1,000,000 has been produced from this mine in eighteen months and ten days.

ANOTHER DIVIDEND.—Calico *Print*, Oct. 11: The Oro Grande Mining Company has just declared and disbursed the September dividend, from the King mine of Calico, the sum of $22,000. This makes the total dividends of last four months $101,000. The work of building Barber's mill and other buildings near it, is progressing as fast as possible. About a dozen mill-wrights and carpenters are at work and a considerable portion of the foundation and framework of the mill is constructed, and it will soon be ready for the machinery, a portion of which is now on the ground. Five houses are being built, to be used respectively as a private residence, lodging house, boarding house, superintendent's office, and assay office. It will be several weeks before the mill will be completed and ready for operations.

Sierra.

IMPROVEMENTS AT THE MARGUERITE.—Sierra *Tribune*, Oct 10: A reporter visited the Marguerite mine this week and found the work on the new plant progressing rapidly. The framework is all up and if no mishaps occur will be completed in another month. The dimensions of the main building are 30x90 ft, with two "Ls," 30x50 ft respectively. The foundations for the new machinery are nearly all in. From the hoisting works to the penstock it is about 900 ft. Between those two points seven towers with sheaves are to be erected; over which the wire rope will pass. Three of the towers are now completed. The penstock and flume are also finished, and the tail race nearly so. The flume is 1200 ft long and 5x6 ft in heigth and width. A 56 inch Leffel double turbine water wheel is in position in the penstock. The wheel will be driven under a 27 ft pressure, and will under full pressure, supply 350 horse-power. This would permit the working of the mine to a depth of 1600 ft with the machinery now being put in. The greater portion of the new plant was designed and patented by Mr. G. Humbert. That gentleman is now at the mine personally overseeing operations and will remain there until the new works are completed and the machinery set in motion. It is expected to have the improvements completed by the first of the month. In the various departments Superintendent Myers is conducting the work in the best manner possible. Underground the outlook is very encouraging. The ledge in the 4th level continues to develop finely. At present it measures about six ft in width. The three-compartment shaft is completed from the surface to the 3rd level. The mill will start crushing in a few days.

GIBSONVILLE.—*Mt. Messenger*, Oct. 11: This is the most prosperous mining camp of Northern Sierra. When the sale of the mining ground between Gibsonville and La Porte is consummated (that may probably soon take place), two tunnels of about a distance of 4,000 feet each, will be started down at the most favorable point near Wallis Creek, southwest of Gibsonville, one and a half miles from the town. Another tunnel in the neighborhood of 2,000 feet will be put in from the head of Little Grass Valley, Plumas Co., three miles north of Gibsonville, directly opposite the main ridge. As this work will be done by European capitalists of unlimited means, engineered by J. H. Thomas, of Oakland, their Financial Agent on this coast, most efficiently assisted by Prof. Stretch, surveyor and mining expert, it will be steadily pushed to successful completion as rapidly as muscle, powder and coin will accomplish the undertaking. The Wild Boar Co., H. Tabor, Supt., San Francisco capitalists, Chapman, of the Pioneer, Grass Flat, being the main interested party, are going ahead slowly with their main tunnel, now in blasting rock. Wm. Towle is vigorously pushing his tunnel ahead through blasting and soft bedrock—half and half—expecting at most any minute to be in the main pay channel of Cox's Fork of Hopkin's Creek. This mine is known as the Nob Hill Claim. Near by Capt. Donahue, of San Francisco, is running two tunnels on separate quartz ledges from where rich specimens were found in the bed of the creek this summer. D. R. Thomas, of Martinez, is operating two claims at Poor Man's Creek, Plumas Co., and Geo. D. Harrington is foreman of the Hopkin's Creek Claim, of which W. B. Thomas is Supt. of the Hopkin's Creek Gold Mining Co. This mining section is looming up in importance, especially as regards quartz interests over there. The Union Co. has done handsomely this year, their gravel being very rich and abundant. Gibsonville Water and Nevada M. Co. are preparing to drift. Main tunnel is in 400 feet, and channel will be tapped in three-quarters that distance ahead by an upraise, affording ample fall. Hydraulicing has been abandoned, and from prospects obtained the lead can be profitably drifted. Jas. Denoon & Co.'s mining property has done well this season. J. B. York has made arrangements with C. W. Cross for the erection of an eight-stamp mill on his ledge in Slug Canyon. A mill has already been purchased, and will be put in place forthwith. The Alaska Co., at Pike City, are working seventy men. The shaft is free of water, pumps are running nicely, and a twenty stamp mill is crushing night and day. Lamping's mill, Messrs. Stewart, Hill, Bothwick and Denmire, proprietors, is crushing quartz from the Del Long ledge. The mining companies over north are laying in their timbers and other winter supplies.

Sutter.

DRY ORE SEPARATOR.—Chico *Enterprise*, Oct. 10: Last Thursday, at the mines near the Butte mountains, in Sutter county, a good and successful trial of the Chaney dry gold separator was made. Out of fifty wheelbarrow loads of dirt, $15 was extracted without the use of water. The dirt went through the machine in one hour and a half, and reduced to two and a half pans of concentrations. The tailings were carefully prospected afterwards to see how much had been lost, and no color was found. The machine is driven by a four horse-power engine, and is of the tumbling barrel process.

Siskiyou.

MINING AT THE KLAMATH.—Yreka *Journal*, Oct. 6: The McConnell claim, on Klamath river, cleaned up $2,000 in the last eight days, with one derrick out of use three days by reason of the breakage of the shaft. The shaft broke square off close to the water-wheel, requiring the removal of the shaft and water-wheel. But for this accident, the yield for the last eight days would have exceeded $3,000. At lower pit good pay is realized in cleaning bed-rock, but not as rich as anticipated. The wheels have plenty of power now, the river having raised by reason of cool weather. At Beebe Bar claim work is progressing steadily with good prospects. This is considered one of the best claims on the river. The Kanaka Company are troubled considerably by seepage water, as their head dam was built on old tailings. The Empire Bar Company are now drifting, and expect to take out considerable money before the winter rains commence. The Fort Jones Company are on bed-rock, and taking out exceedingly rich pay. The Centennial Company have struck fine sand about 25 ft down, and are also working the top ground towards making expenses in going down to bed-rock. Jackson & Crary, at Oak Bar, are realizing good pay, varying from eight to ten ounces a day. Mott & Co. and several other companies at and below Oak Bar are beginning to get down on pay gravel.

Trinity.

A HEALTHFUL MINE.—Trinity *Journal*, Oct 11: Dr. A. F. Lambeth, of Deadwood, visited Weaverville last week. The Doctor is superintending the Brown Bear Mine for the new proprietors, and in answer to our queries regarding the condition of affairs informed us that the Brown Bear was in a "healthy condition—without the least symptom of disease." He is a gentleman of large experience in quartz mining and knows whereof he speaks.

NEW RIVER.—Cor. Yreka *Union*, Oct. 10: People from New River report that district as being rich in quartz but fully supplied with labor, and hence it would be a poor field in which to seek employment; the mines are situated on the Trinity side of the ridge separating that river from the South Fork of Salmon. They are easily accessible from two points on Salmon, both distant some 40 miles from Etna. The one (the upper) is via St. Clair creek, a creek some short distance below Ceeilville, on South Fork of Salmon, the lower via Methodist creek, just below Yocamville. Some 200 men are on the ground, and one 8-stamp mill is already erected, and two other mills, of small capacity, are in course of erection.

Tuolumne.

PROMISING.—*Union Democrat*, Oct. 11: C. L. Lang is operating on a very promising mine on Indian Creek, four miles from Groveland. He says he has a chute several thousand ft long of ore which works from $7 to $12 per ton by free process. The pay chute averages about 18 inches in width. Mr. Lang has worked 30 tons of rock which gave a return of $30 per ton. He is running a tunnel on the vein for the purpose of opening up stopes. When the mine is a little more opened Mr. Lang will erect some arastras, for which there is abundant and easy utilized water power, to reduce the ore.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Oct. 11: Rapid progress is making in the incline below the 2800. It is cutting the east clay of the vein as it goes down, the dip of which pretty nearly corresponds with the angle at which the winze is being sunk. The winze is now down a little over 100 ft on the slope. Excellent work is doing in this winze, as it is being sunk at the rate of 30 ft per week. Work has been temporarily suspended in the northwest drift on the 2800 level as the sending out of so much waste rock to be hoisted at the Combination shaft interfered with the sinking at that point. Last week they extracted on the 200 level and sent to the Eureka mill 606 tons of ore and received $5,933.10 in bullion.

OPHIR.—A considerable amount of ore is still being extracted from the fillings of the old drifts on the 250 level, which ore is being sent to the mills. The diamond drill was sent ahead from the face of the drift on the 500 level a distance of 150 ft when it tapped the water in the old works. This water is carried down the shaft to the 1500 and thence flows out to and through the Sutro tunnel. The south drift on the 1300 level is being advanced at the rate of about 60 ft per week. At the joint Mexican, Sierra Nevada and Union Con. winze a station is being cut out at the 3300 level. This station will be completed in a day or two, when a cross-cut will be started west.

ALTA.—The northeast drift on the 2150 level is being steadily advanced. It is expected that it will reach the vein in about 10 days. The water is being allowed to drain out as the work advances and it is thought that there will be no more water to handle when the vein is tapped than there will be at present.

SIERRA NEVADA.—The station at the 3300 level of the joint Ophir, Mexican and Union Con. winze is completed. From this station explorations will be made to the westward, in which direction lies the ore vein found on the levels above. The water is handled without trouble.

ANDES.—The west crosscut from the main north drift is showing a large amount of quartz of excellent quality. The north drift has also shown good material. During the past week a considerable amount of work in the way of retimbering and repairing has been done on the main drift.

BENTON—The drift on the 2150 level is being pushed forward as fast as can be done without bringing out too much water. It will be yet about 10 days before the vein is reached. The water is handled with the pumps running at about six strokes a minute.

SAVAGE.—Good headway is making in the tunnel that is going in from E street. This will explore the vein at the depth of about 200 ft, where it is expected will be found the continuation of the body of ore now being mined in the Hale and Norcross.

YELLOW JACKET.—The old upper levels are still yielding a considerable amount of low-grade ore, and

this yield may now gradually be increased with the increased volume of water in the Carson river. A good deal of prospecting is being done in various directions.

BEST AND BELCHER.—Good headway is being made in the north drift on the 825 level. The drift is now out about 550 ft. Not much work has been done on the 2500 level, as they have been engaged in making repairs to the Bonner shaft.

COMBINATION SHAFT.—The sump below the 3000 level will now soon be completed. The next work will be the cutting out of a station at the 3000 level in which to set up the new hydraulic pump, now in process of construction in San Francisco.

CROWN POINT.—The amount of ore extracted is gradually being increased as the rise of water in the Carson river allows of the running of additional stamps. A considerable amount of prospecting work is being done.

MEXICAN.—The station at the 3300 level of the joint Ophir, Sierra Nevada and Union Con. winze is about completed. From this station a cross-cut will be started west to explore the vein in that direction.

ALPHA.—The vein is now being exposed at the 500 level, where there is a large body of quartz that gives encouraging assays. Cross-cutting in still carried on in the same body of quartz at the 600 level.

CON. VIRGINIA AND CALIFORNIA.—The northwest drift on the 1700 level is making good headway and is in material of a very favorable appearance. Cross-cutting from this drift will soon be in order.

BELCHER.—As the volume of water in the Carson river increases the amount of ore extracted is also increased. A considerable amount of exploring work is being done.

UTAH.—The usual progress is making in the southeast tunnel on the 1950 level. The rock is vein porphyry, and has been hard for a considerable distance.

OVERMAN.—A considerable amount of low grade ore is being extracted through the Petaluma street tunnel. This ore is being worked at the Vivian mill.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, Oct. 9: During the past week the incline has been sunk 14 ft, and is now 350 ft below the third level. The west drift on the fifth level has advanced 15 ft during the week, and shows ledge matter with a very little low-grade ore. The intermediate, between the fourth and fifth levels, is in 20 ft and shows spots of ore of fine grade. The west drift on the fourth level has advanced 17 ft, and the north cross-cut, from the same drift, has advanced 15 ft. Neither of these places shows anything of value. The intermediate drift, between the second and third levels, and west of the shaft, shows a strong ledge of $35 ore. The east intermediate, between the second and third levels, shows a narrow streak of low-grade ore. The west intermediate, between the same levels, shows a narrow streak of low-grade ore. The remaining portions show no marked changes. Twenty-five men were discharged on Tuesday last, in order to reduce expenses as much as possible while the question of building a mill is being considered.

Cortsz District.

PROMISING.—Cor. Eureka *Sentinel*, Oct. 12: The mining industry generally promises well at Cortez. The Garrison mine, which is the principal one in the district, is looking very well. In fact, while it is yielding now very handsomely, it gives promise of showing up a most important bonanza for the future. The deposit is not a pockety concern. The ledge is a perfectly defined fissure, which varies from 18 inches to 6 feet in width. As to the reduction of the ore, which is plentiful now, and which promises to come out hereafter in greater quantities than ever before, Mr. Wenban, the proprietor of the property, is having the ground graded for the erection of works for milling or smelting process. For the purpose of getting the necessary water, he has laid pipe for a distance of seven miles. He is busy grading roads, etc., preparatory for future work on an extensive scale to correspond with the flattering prospects. He has employed altogether in the neighborhood of 150 men, of various nationalities. Mr. Lane is the day foreman of the mine, and is one of the most experienced and reliable miners in the State. The people in the little camp are cheerful and confidently expecting good things for the future. On a recent run of tailings the company had got out four large silver bricks.

El Dorado Canyon District.

GOOD REPORTS.—Pioche *Record*, Oct. 4: Good reports come in from El Dorado canyon. The mines of the Southwestern Co. are in good condition and there is more ore in sight than ever before in their principal mine. There is a full force of men being worked by this company.

Lewis District.

NEW MILL.—*Silver State*, Oct. 8: James McCormick, who has had much experience in building and running quartz mills, went to Lewis yesterday, to build a new mill for G. W. Bothwell. The mill is intended for working ores from the Pittsburg Con. mine.

Mount Cory District.

MORE HELP FOR THE MINERS.—Walker Lake *Bulletin*, Oct. 9: The Mount Cory mill has worked several lots of ore from Candelaria of late very successfully. It had been doubted whether the ore from that district could be worked by the process in operation at this mill. The good results attending the late trials are very encouraging to all miners in this section. The Mount Cory Co. although abundantly supplied with ore, will occassionally purchase rock from outside mines, in order to help along those who are struggling under the difficulties engendered by want of ready money. As the mill does its work in the cheapest known manner, and as the outside work is done more for the purpose of assisting those who have money tied up in ore, than for profit, the prices paid are liberal in the extreme, and the company, which has done so much for the improvement of business in this county, should receive full credit for its enterprise and energy.

Osceola District.

GOOD REPORTS.—Cor. Eureka *Sentinel*, Oct. 10: Reports from our neighboring camp, Osceola, are also good. The Osceola Company, of which Goodbie & Hampton of Salt Lake are at the head, have at last concluded to bring in water to their placer ground, of which they own some 400 acres. Bishop Black, of Deseret, Utah, having obtained the contract to cut the ditch, will be on the ground in a few days with some 200 Mormons, those men, it is said, having agreed to work for $1 a day and board; those with teams $3 per day. They expect to have the ditch finished by the time the snow will commence to melt next spring.

Pennsylvania District.

BETTER ORE.—Pioche *Record*, Oct. 11: It is believed that a big mine has been struck in Pennsylvania district. The ore is of better grade than any yet found in the district. The claim is a continuation of the Klingensmith ledge.

Taylor District.

HIGH-GRADE ORE.—Cor Eureka *Sentinel*, Oct. 10: Our mines are coming to the front, the Argus Company having unearthed a large body of high-grade ore in the Sunrise claim. The company's mill is running steadily, with the prospect of its doing so for an indefinite period. The Monitor Company are shipping their usual amount of high-grade ore to their mill on Steptoe creek.

White Pine District.

HAMILTON.—White Pine *News*, Oct. 10: We paid a hasty visit to the county seat this week, and were pleased to note an improved condition of things. The change since our last visit in July was marked by a feeling of general improvement. The mining outlook with our neighbors is indeed flattering. About 100 men are at work in the district. All kinds of business has revived, and the feeling of the people is of a healthy tone. We visited Treasure Hill, went through the Stafford mine, but what we saw will have to be deferred, through want of time, till next week. At this time we can only say the old district promises a bright future.

ARIZONA.

WICKENBURG.—Phœnix *Gazette*, Oct. 9: F. A. Pollock returned yesterday from a trip to Vulture and surrounding camps. He informs us that the mill is running steadily and the boys are expecting a pay day on Saturday or Monday next. At Wickenburg the six concentrators are shut down temporarily, awaiting some slight repairs. The six concentrators now treat about 40 tons of tailings daily and it is proposed to add four more machines, which have in fact, already been ordered. Even with this increased capacity there is an immense amount of work ahead, as it is calculated that the tailings aggregate 40,000 tons. John Mulholland and Martin Cummings, old Yavapai prospectors, together with three or four others, are now at Smith's mill, where they are putting in an arastra. From this, it will be seen that times are lively in the northern part of the county.

UNITED VERDE COPPER CO.—Arizona *Miner*, Oct. 6: Our reporter called on Gov. Tritle this morning and requested information as to what the product of the United Verde copper mines has been since the furnace started last year. He very obligingly gave the following figures: The furnace has run to Oct. 1, 1884, 289 days, and Supt. Thomas gives the product by assays at the mines 4,396,951 pounds of refined copper, equal to approximately 2,198 tons. And the product in silver as 237,951 ounces. Estimating the average price of copper at $250 per ton, the gross yield of copper amounts to $548,500; and rating silver at $1 per ounce, $237,951. Total gross product, $787,451. This does not look as though the enterprise was a failure, as has been said by some of our exchanges.

COLORADO.

GENERAL NOTES.—Lexington *Courier*, Oct. 9: The work of removing the Big Chief mill to Empire commenced last week. Eighteen inches of 300-ounce ore has been opened up by Zang & Co., in the Beaver lode, near Empire. Messrs. Veach & Moore are working a new property on McClennan mountain, and their prospects are flattering. Barrett & Co. resumed work on the Tenth Legion mine, at Empire, last Saturday. A new engine will be put over the shaft. John O'Donnell, lessee on the Equator, realized $1,400 from a mill-run recently. It was the result of one month's work. Jones & Roberts have taken a lease on the east drift in the Centennial mine, and have just opened up a nice body of ore. The Baltimore produced over $17,000 last month. Mr. Fillius, the superintendent, thinks the production for October will reach about $20,000. Major Richard Hornbrook is sinking a shaft on the placer grounds below Idaho Springs, with the intention of doing some extensive work. Peter Yost & Co, lessees upon the Baker mine, Kelso mountain, have a vein of solid ore three inches thick, which mills between 500 and 600 ounces per ton. The Atlantic-Pacific tunnel has been redeemed by the stockholders, and we hope to see extensive operations resumed upon it at an early day. There are a number of excellent mines ahead of it. Carothers & Keaggy, owners of the Lawson strike, the Orient, have a still larger pay-streak, and are shipping quantities of ore which runs from $400 to $1,300 per ton. The owners see a fortune in the property. Our sampling works are treating a large quantity of mineral this month, and the best feature of the matter is, that the ore is of an exceptionally high-grade. During the month of September, there were 50 cars of ore, or about 550 tons, shipped from the Georgetown depot, valued at about $75,000.

IDAHO.

COEUR D'ALENE.—Cor. *Oregonian*, Oct. 9: There being no water in the tributaries with which to mine the developments has been confined to the main gulch, commencing about two miles above Eagle and running up the gulch a distance of about seven miles. The gulch itself is more like a mountain basin than anything else. It is from 40 to 120 rods wide, and on the north side, having a general parallel course with it, there are several old river beds or channels having a vertical elevation above the gulch of from 75 to 300 it, through which intersecting ravines supplied with gold washed down from these have cut, and the main gulch is mostly old river beds. This "old wash," as it is commonly called, has been traced for a distance of 30 miles. Thousands of acres of it have been located. In the absence of water to work it, it has thus far been only slightly prospected by shafts and tunnels, the miners waiting for some one with sufficient capital to bring water upon the hills. Messrs. Walsh & Hubbel, old and experienced placer miners from California, are now digging a ditch for this purpose, and when this and other ditches are completed, the Coeur d'Alene region will be an eye-opener to those who imagine that there is nothing there. Men are now packing gravel in sacks from the sides of the mountain upon their backs to water, and making from $25 to $50 per week. When a sufficient number of mining ditches shall be dug the whole aspect of things will be changed. The water being taken from the main gulch, will enable the gulch miners to work to better advantage. Troubled as they are with a superfluity of water, hydraulicing the hill ground will make available the immense resources of wealth which it contains, while the muddy water, turned back into the main gulch, will puddle the bed of Pritchard creek, so that the gulch claims can be successfully opened in the deep ground. Three or four days before leaving home I went over the entire camp where mining has been carried on, and found that less than four acres of bed-rock had been cleaned up, all told. This shows a yield of over $40,000 to the acre. The present output of gold is not less than 1,000 nor more than 1,500 ounces of dust per week. Several of the claim-owners ship their dust directly to Helena, and my estimate is based upon my knowledge as to what these claims yield, the quantity of dust purchased weekly by the banks and taken in by a few of the merchants. It is a mistake to suppose that Pritchard gulch comprises the entire gold field. On Trail gulch several claims are opened, and are proven to be rich, while there is as much to show that Beaver creek is rich as Pritchard gulch itself showed last spring.

MONTANA.

THE LITTLE ROCKIES.—*Inter-Mountain*, Oct. 7: Mr. Frank Gleason has been kind enough to place in our hands a letter received by him from James Wilson, who writes from the Little Rockies under date of September 26th. From the note we condense as follows: I left Helena on the 5th of this month for the Little Rocky excitement. I met a couple of old friends here and got introduced to some of the boys. The country looked very favorable for prospecting, so I took my pony and tools and crossed a divide into the next gulch, where only two claims were being worked. I got on an average 18 cents to the pan. I staked out my claim right there and am now busy building a cabin. I am going to stay here this winter, or just long enough to make my pile, and I can do it right here. The boys in the next gulch are making their $10 to $15 a day, but they have been in here a couple of months and have got their claims in shape. I am sure we can do as well over here—if not better—when we get things fixed. There must be some rattling good quartz leads in these hills, and you bet they will be hunted for at no distant day. How far these diggings extend nobody seems to know, at least none of the boys I have talked with. It is the finest country for game you ever saw. Buffalo, deer, geese and ducks till you can't rest, and a fellow won't have to live on sowbelly and beans all the time. Yesterday Pete McBride found a nugget that weighed between five and six ounces.

THE BULLION PRODUCERS.—Butte *Miner*, Oct. 8: The Parrott Company concentrates about 100 tons of ore a day, and runs through the furnaces about 130 tons. Of the new works only two calciners are as yet in use, and these are running for the Parrott Company. The new works now being completed at the smelter do not belong to the Parrott Company, though the controlling interest is owned by parties who compose the Parrott Company. Everything about the works is running very smoothly under the very skillful management of Mr. Gaylord. The new concentrator for working the ore from Clark's Colusa is nearly ready for use. It will be running this week. A water-jacket furnace is to be put up by the side of the concentrator. The excavating is almost done and the laying of the foundation well advanced. The tramway from the mine to the concentrator is ready for use. At the mine the late improvements are doing good service. The new engines and boilers are at work, and the new hoist, an experiment in this district, works like a charm. The new cages for the shaft have not yet arrived. The Montana Copper Co. are increasing their capacity. They have begun the work of putting up two new calciners and a new concentrator of 75 tons a day capacity. On the Colusa the shaft is down 600 ft. The Montana Parrott mine belonging to this company will be in good working order in about a week. On this mine they have been putting up a new hoist and hoisting works. These are now almost completed, when probably this week the work of taking ore from the 300-ft level will begin. The West Colusa, belonging to the Montana Copper Company, is down about 180 ft. It is not known what this mine amounts to, as no levels have been run. The Liquidator is down 300 ft. From 40 to 50 tons a day are being shipped from this mine. In this mine between 600,000 and 700,000 tons of good concentrating ores are in sight. This is streaked all through with more or less of first-class ore. The Atlantic is an exhibition of faith, for as yet at a depth of 90 ft no lead or sign of a lead is in sight. At the depth of 90 it water was struck. The work of sinking was then suspended until the two-compartment shaft could be well timbered and a steam hoist and pump be put up. When this work is done sinking will be resumed. The hope upon which this work is based is that the copper lode which is known to run from the Big Butte, on the west side of Butte City, across to the Colusa mine, also crosses the valley to the main range. Just east of the claim taken up by the Atlantic Company is a fine prospect of copper at 50 ft called the Greenleaf, and it is on a line between the Colusa and the Greenleaf that this Atlantic shaft is sunk. Some time ago we referred to work being done on the Katy Morris, southwest of town, by Evans, McMillan & Co. Last week they completed a shipment of 50 tons of ore to the Moulton mill and received $1,200 over and above all expenses. This ore was taken out of the stopes above the water level. Last week they put in a No. 4 Knowles sinking pump and a small steam hoist. They propose now to sink the shaft about 60 ft further before running any more levels. At 70 ft the vein was from 18 inches to two ft wide in a level that was run 100 ft. This ore taking first and second class together assayed 40 ounces. The parties doing the work are much encouraged.

NEW MEXICO.

THE SIERRA COMPANIES.—Lake Valley *Herald*, Oct. 9: The report of the Sierra Mining Companies, which has been sent us, is one of the most satisfactory publications of the kind it has ever been our good fortune to examine. The showing in reference to the mines and their condition is very gratifying both to the stockholders and to those who are indirectly interested in the development of the mineral resources of the Territory. It shows to the credit of the Sierra Grande Company for the year the very large amount of $343,032.29. The total expenditure for the year was about $430,000, including an exceptional amount for permanent improvements. These latter are now valued at $233,857.44. The ores which had been shipped to the smelter and not yet accounted for at the time the report was made were valued at $121,822.73. The Sierra Bella has produced within the year almost a quarter million of dollars worth of ore and has paid its first dividend of $30,000. The report of the manager, after giving a description of the property and of its geological formation, reaches these conclusions: "First, the working of the mines has yielded a profit. Second, the more extended the work became the better were the results, *i. e.*, the more ground has been opened the more ore was found. Third, the more ore was taken out, and the more prospecting was done, the more apparent became the permanency and structural regularity of the ore bodies." The mine is fulfilling all of the favorable predictions the *Tribune* and *Herald* have ever made for it, and that it has a great future as a producing mine there can be no doubt.

UTAH.

REVIEW.—Salt Lake *Tribune*, Oct. 10: For the week ending October 8th, inclusive, the receipts of bullion and ore in this city were as follows: Bullion, $149,260.64; ore, $21,900; total, $171,160.64. For the previous week the total receipts were $170,112.30, of which $126,702.30 was bullion and $43,500 ore. During the week last passed the Horn Silver shipped in 19 cars of bullion, valued at $57,000, making the total shipments of this company for this year to date $1,953,000. The shipments of the Ontario for the week were 56 bars, assaying $41,057.30; total for 1884 to date, $1,320,295.50. The sixth level of the Ontario is being driven through the new west ground toward the Daly shaft. It has still something more than 2,000 ft to go, although the face is now 1,400 ft west of shaft No. 3. The lateral drain tunnel is kept a hundred ft or so ahead of the opening on the vein. The fifth level is not far behind. The two have to be run substantially together, and connected by winzes to keep the air good. The ninth level must now be opened east and west, from shaft No. 2, 600 or 700 ft. Ore is being taken from the west ground on the eighth and from the sixth, up well toward the third. Completing the sump and station on the tenth level, shaft No. 3, still awaits the slacking off of the water rising from the bottom of the shaft, but Mr. Chambers thinks they will undertake to do it anyhow, within a month or so. Mr. Daly is tanking water, and at the same time putting in pumps, additional boilers, building ore houses, and generally preparing for winter work. It is expected he will be ready to start the pumps in 30 or 40 days. He cut through the hanging wall of the vein about 200 ft south of the shaft, and ran into it 12 ft, 3 ft of which was in ore that it is thought will average 100 ounces. Whether he struck the foot-wall or no is uncertain. The strike is very encouraging for the Ontario, as showing the probable, almost certain, continuance of their vein 3,000 to 4,000 ft west of shaft No. 3. The Ontario paid its 99th dividend on the 30th of September. Dividends paid this year, $675,000; grand total of dividends, $5,825,000. Assessments, none. The Mountain Chief Mining Company starts its one-stack smelter to-day. The company has 67,500 shares, par $10, and it is chiefly owned in St. George, W. B. Pace being president and practically the manager. One goes up the Clara, 12 miles from St. George, to the smelter. Thence it is about the same distance to the mine. There are eight locations, 600x1,500 ft—about 160 acres. The outcrop all over is said to be a copper-stained rock, and it was only by accident that it was found to lead to carbonates. It has developed wonderfully, according to accounts, recently. Mr. Dewey, one of the owners and directors, says they claim to have found a cave containing a body of ore 22 ft thick, 40 ft wide and 300 ft long. The ore is a carbonate carrying 65 lead and 15 silver, as near as can be told, and apparently improving in quality.

WASHINGTON.

THE WORKING OF OUR MINES.—Kittitas *Localizer*, Oct. 9: The value of our mines is much enhanced by the abundance of good timber and the large supply of water that is found throughout all the mining camps of this county. There is a large field open for capital to make good investments, and there are many opportunities for experienced miners with capital to realize large profits from working the ores now discovered. Many of these mines, although imperfectly worked, and none of them penetrated to any great depth, show rich deposits of pyrites of iron and free gold. The mines that have been worked have been controlled by men without experience in mining, who were loth to employ men who possessed a knowledge of the business. In short, the wages asked were thought too high to justify the outlay. The mines were worked by inexperienced owners, and the processes employed, so imperfect, that less than half of the gold was saved, and instead of making money out of rock worth $40 a ton, they were run at an absolute loss and a great waste of labor and money, the latter of which might have been saved if an expert had been employed to superintend the process of reduction. As there are no means of transportation at command, reduction works will have to be erected contiguous to the ore beds where the precious metal can be extracted economically, until such time as facilities for shipment are created that will not absorb all the profits in the handling of the crude ore. In time many of the mines may find an outlet to lake Cle-el-um and then down it to the Yakima river, but as that time is several years distant some means must be employed for the present to test the worth of these mines. One small mill erected in the district might be the means of testing the worth of nearly all the mines in the Cle-el-um country.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

PARKE & LACY, General Agents, **21 & 23 Fremont St., S. F.**

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited

To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

PREMIUMS AWARDED.

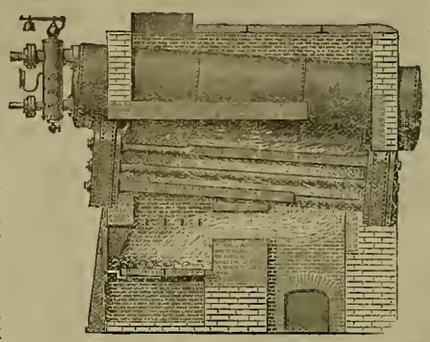
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

ST. LOUIS, MO., Sept. 28, 1883

Messrs. Adolphus Meier & Co. GENTLEMEN. We cheerfully certify that the "*Heine Patent Safety Boiler*" put up by you in our establishment has proved very satisfactory in its working. The chief points of excellence in the "Heine Safety Boiler" are its economy in fuel and space, freedom from scaling, aptitude for power and heating purposes, working equally well with clear and muddy water. We warmly recommend it to all using steam machinery. Yours truly,

ANHEUSER BUSCH BREWING ASS'N

OFFICE OF SUPT OF ROYAL RAILWAYS,
BERLIN, Sept. 23, 1883.

To Mr. H. Heine, Civil Engineer: In reply to your inquiry of September 24, we respectfully inform you that the three boilers built under your patents, under steam since September 25, 1881, at the Alexander Place Depot, as well as the two at Friedrich Strasse Depot, under steam since September 22, 1882, have given good satisfaction, requiring no repairs whatsoever to date. The internal cleaning of the boiler was always accomplished with ease on account of the convenient arrangement of the tube caps, the adhesion of scales being fully prevented thereby, and the boilers kept in prime condition.

(Signed): BRAUCKE.

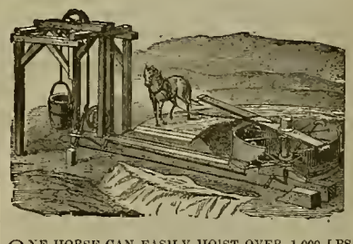
MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

A Great Triumph!

WON BY THE MANUFACTURERS OF THE
EUREKA CEMENT,

GOULD & HILL, Proprietors,
103 and 105 Fremont St., San Francisco.

On the 25th day of August, 1884, Judge Sabin, of the United States Court of Equity, decided the great infringement case of the Salamanda Felting Company of New York and Philadelphia vs. the EUREKA CEMENT, in favor of the EUREKA CEMENT. This decision is one of the most important that has been rendered for many years, because it gives Messrs. GOULD & HILL the unrestrained right to continue the manufacture of the BEST COVERING FOR STEAM BOILERS AND PIPES that is known to the world.

Mining Share Market.

The interest manifested in politics this week has contributed still further to the dullness in the stock market and transactions have been light. At the north end of the Comstock the station at 3300 level of the deep winze is about completed, and the next work in order will be the running of a west crosscut to explore the bodies of quartz found above and lying to the west. At the Ophir they will soon tap the old works with the drift now being advanced on the 500 level. The diamond drill has been put in and the water is now being drained off. It is expected that a considerable amount of ore will be found between the 500 and the 250 levels. At Gold Hill the several mines are taking out and sending to mills on the river a great deal of low-grade ore. The Overman is now to be counted among the Gold Hill mines that are producing ore. In the California they will soon begin a search for low-grade ore on the 1700 levels, to the northward of where ore was being taken out at the time of the fire in the old timbers. At the Best and Belcher and Gould and Curry they will soon be ready to begin cross-cutting on the 825 level, where there is a good deal of ground that has never been explored.

The following mining companies had the amounts mentioned, on hand, on the first of the month: Alta, $29,738.26; Argenta, $104.34; Alpha Con., $11,239.89; Bulwer, $4,413.80; Best and Belcher, $26,656.04; Benton Con., $21,218.29; Bodie Con., $81,332.56; Belcher, $16,293.15; Crown Point, $24,649.24; Chollar, $29,564.17; California, $19,380.55; Con. Virginia, $14,156.54; Exchequer, $8,126.14; Gould and Curry, $25,185.45; Hale and Norcross, $7,995.54, Mexican, $23,598.22; Mono, $24,832.26; Martin White, $5,759.50; Navajo, $69,378.45; Ophir, $19,420.80; Occidental, $3,201.38; Potosi, $44,011.20; Savage, $2,803.82; Sierra Nevada, $34,583.22; Tioga Con., $821.83; Union Con., $32,596.28; Utah, $7,900.41.

Bullion Shipments.

Drum Lummon, Oct, 10, $10,000; Mt. Cory, (for September,) $43,872; from Georgetown, Col., (for September,) $75,000; from Silver Plume, Col., (for September,) $45,000; Moulton, Sept. 29, $7,011; Dexter, 29, $3,595; Alice, 29, $9,600; Silver Bow, 30, $6,720; Lexington, Oct, 1, $9,400: Alice, 1, $6,795; Moulton, 3, $8,286; Alice, 3, $4,155; Hanauer, 7, $5,750; Stormont, 7, $1,800; Wood River ore, 7, $4,200; Christy, 7, $3,530; Ontario, 7, $8,731; Horn Silver, 7, $9,000; Hanauer, 8, $1,950; Crescent, 8, $3,050; Christy, 8, $1,685; Ontario, 8, $4,520; Horn Silver, 8, $1,200; Hanauer, 9, $3,800; Wood River ore, 9, $2,230; Ontario, 9, $10,570; Vienna, 9, $4,550; Horn Silver, 9, $12,000; Horn Silver, 10, $6,000; Christy, 10, $1,657; Horn Silver, 11, $6,000; Ontario, 11, $4,302; Christy, 11, $1,800; Hanauer, 12, $5,450; Horn Silver, 12, $6,000; Ontario, 12, $6,004. The banks of Salt Lake city report the receipt for the week ending Oct. 8th, inclusive, of $149,260.64 of bullion, and $21,900 of ore; a total of $171,160.64.

WHAT IS THE DIFFERENCE BETWEEN "PEBBLE" AND "GLASS" IS ASKED EVERY DAY.—"Pebble," which always retains its transparency, is much more highly prized for its greater hardness, and being cooler and possessing greater refractive power, a better conductor of heat than glass. "Glasses" are more or less influenced by the damp state of the atmosphere, become turpid, soil more readily, thereby rendering them more difficult to keep clean, and much more liable to become scratched in use. The nature of the material of which lenses are made can be best ascertained by determining the co-efficiency of light; by placing the lenses between two plates of tourmaline, called pebble test, which neither the flint or crown glass can the light pass through, showing the greater transparency of the pebbles over glass; of course taking for granted that where "rock crystal" is used, if not homogeneous, but of a stratified growth, that the lenses will be cut at right angles to the axis of double refraction, as such lenses would be bi-refringement and split up a ray of light, making them very injurious to the sight and having no advantage over glass, only in cheapness. "Rock crystal" lenses badly cut, either through carelessness or design, in order to cut the largest number of lenses from a given piece of rock, may be found at the Cheap Johns and other venders of spectacles, claiming for them all the good qualities possessed by the justly celebrated Pebble Spectacles, obtained only at C. MULLER'S Optical Depot, 135 Montgomery street, near Bush, opposite the Occidental. X

THE Alice, at Butte, Montana, is still improving, the August output having been the largest of any month in the history of the property.. Dividends so far paid aggregate an even million dollars, consisting of 10 dividends of $10,000 each, and 2 of $50,000 each.

SIXTY men are at work on the smelter recently shipped to Big Lost river, Idaho, by Penner Bros. & Co. It will be in operation in a few or twenty days. It will have a capacity of thirty tons per day.

UTAH ore-shippers and smelting men complain that better rates are given to ore-shippers from the Idaho mines to Omaha than to Salt Lake. The freight agent of the Union Pacific says the Omaha smelters pay more for Wood river ore than Utah men do, and it is not because of discrimination that Utah does not get the bulk of the trade.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING OCTOBER 7, 1884.

306,211.—DRAFT EQUALIZER—O. C. Beck, Rickreal, Or.

306,134.—PORTABLE DERRICK—Donald Crane, Woodland, Cal.

306,225.—DIMINISHING THE CONSUMPTION OF BATTERY IN NORMALLY CLOSED CIRCUITS—C. Cummings, Reno, Nev.

306,144.—MAGAZINE GUN—W. R. Finch, Eureka, Cal.

306,145.—ORE PULVERIZER—D. V. Goodson, Bodie, Cal.

306,152.—PUMP—Geo. P. Harding, Woodland, Cal.

306,273.—SHEEP DIP—H. B. Marshall, Pomona, Cal.

306,173.—BARREL-TRUSSING MACHINE—Thos. Murphy, S. F.

306,188.—DEVICE FOR RAISING AND LOWERING WINDOWS—Harriet W. Strong, Oakland.

306,122.—BEE HIVE—M. Van Ensley, McMinnville, Or.

306,368.—ROTARY PLOW FOR SUBMARINE WORK—A. W. Von Schmidt, S. F.

306,300.—HAY PRESS—H. L. Whitehead, Island City, Or.

Patents Allowed.

Among patents recently allowed, and not yet announced, we are at liberty to mention the following which will soon issue:

CONCRETE—E. L. Ransome, S. F.
LUBRICATING CUP—J. T. Smith, S. F.
GATE—C. W. Scott, Lemoore, Cal.
GOVERNOR—J. P. Simmons, S. F.
FIRE ESCAPE—C. J. Shore, Sacramento.
BILL PLATE, CARD RECEIVER—J. S. Matthers, Alameda, Cal.
OVERSHOE—H. O. Hooper, S. F.
GREASE TRAP—N. T. Whiting, S. F.
GOLD EARRING APPARATUS—Brown & Field, Lemoore, Cal.
TWO-WHEELED VEHICLE—J. A. Bilz, Pleasanton, Cal.
TYPE WRITER—E. S. Belden, S. F.
LINING FOR CHIMNEYS—J. Browell, S. F.
APPARATUS FOR MAKING EXPLOSIVE COMPOUNDS—E. B. Hardy, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufacture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.
2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough oil to prove what we say. Our oil has now been adopted as

Cheaper, More Economical, and More Serviceable than any other Oil

On the Central and Southern Pacific Railroads, the Northern Pacific, South Pacific Coast, and North Pacific Coast Railroads, the Oregon Railway and Navigation Co., Pacific Coast Steamship Co., and all the prominent Iron Works, Saw-mills, etc., on the Coast and Puget Sound. ADDRESS:

GEO. H. STRONG.
Dewey & Co.'s Scientific Press Patent Agency
ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG - California.
J. J. BARTELL—Sacramento Co.
A. C. KNOX—Nevada (State).
B. W. CROWELL—Fresno and Tulare counties.
GEO. MCDOWELL—Amador and Calaveras counties.
WM. PARCOE—San Francisco.
WM. H. COOK—Los Angeles Co.
H. G. PARSONS—Montana and Utah.
G. W. INGALLS—Arizona.
D. K. BRAMBLE—Humboldt and Del Norte Co.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR USED, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

WANTED.

By a sober, intelligent American, employment as Machinist, Agent, Writer, Engineer or Explorer, in any place or climate, where risk is considered in determination of wages. Address
WM. WALES, San Francisco, Cal.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices 47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F.

ASSESSMENT NOTICE.

The Lamphire Gold Mine and Milling Company—Location of principal place of business, San Francisco, Cal.; location of works, Tuolumne Mining District, Tuolumne County, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on Friday, the third (3d) day of October, 1884, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the President, David McClure, at the office of the company, room No. 2, No. 529 Montgomery street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on Monday, the tenth (17th) day of November, 1884, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the first (8st) day of December, 1884, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

ADDISON MARTIN, Sec'y.

OFFICE—Room No. 2, No. 529 Montgomery Street, San Francisco, California.

California Inventors Should consult DEWEY & CO., AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 252 Market St., S. F. Elevator 12 Front St

MICA, MINERALS, PRECIOUS STONES.

Native Platinum and Scrap purchased.

SQUARE FLAX PACKING.

Entirely Exempt from Hemp or Jute. Softest and Most Pliable Packing Made. Does not lose its Strength when worn by the rod, and does not Scatter or dissolve by power of Steam or Water.

Sufficient for a Trial will be Furnished, Free of Charge.

—MANUFACTURED BY—
W. T. Y. SCHENCK,
36 California Street, San Francisco, Cal.

F. A. HUNTINGTON,
SAW, SHINGLE, AND QUARTZ MILL MACHINERY.

We Call Attention to the Following Testimonials as to the Capacity and Durability of the Centrifugal Roller Quartz Mill:

SAN FRANCISCO, Dec. 27, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—DEAR SIR—The four-foot Centrifugal Roller Mill, bought of you in August, 1882, for the Whidden Gold Mining Company, of Shingle Springs, has given entire satisfaction, both on our own and on custom work, saving from 85 to 90 per cent of the gold in the mill. In conclusion I will say that we are so well pleased with it that Mr. Whidden and myself are putting one of the same size on the Tohongo gold mine, near Ravenna, in Los Angeles county.

Yours truly, P. VEASEY,
34 California St., S. F.

FINE GOLD GULCH, Nov. 10, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—DEAR SIR—In reply to your inquiry concerning the working of your Centrifugal Roller Quartz Mill, I am pleased to say that I run one of them for seven months, doing custom work on different varieties of rock, and that the mill gave satisfaction in every respect, and did all that you claim for it.

Yours truly, BYRON JENNINGS.

GARIBALDI MINE, Dec. 17, 1883.

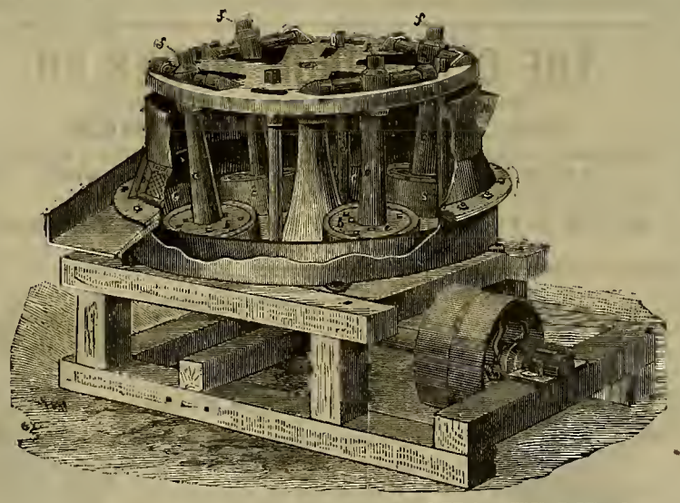
F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR—In reply to yours of the 10th inst., I take pleasure in assuring you that your Centrifugal Roller Quartz Mill gives entire satisfaction, and I can heartily recommend it to mining men who want a cheap and efficient crusher.

Yours truly, E. I. PARSONS, Supt.

32 WASHINGTON AVENUE,
SAN FRANCISCO, Dec. 29, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR: Having run one of your Centrifugal Roller Quartz Mills on sample lots of rock from more than twenty different mines, I must say that in every instance it has given the best of satisfaction in every particular; and I recognize its superiority over any other mill manufactured.

Very truly yours, D. O. MOWRY.



CENTRIFUGAL ROLLER QUARTZ MILL.

The work done by the Centrifugal Roller Quartz Mill, during the past two years, on various mines and different kinds of rock, PROVES ALL THAT IS CLAIMED FOR IT, VIZ.:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use; all of which any practical miner will comprehend when seeing it in operation.

SONORA, CAL., Dec. 1, 1883.

F. A. Huntington, Esq., San Francisco, Cal.
DEAR SIR:—In reply to yours of recent date, inquiring about the Centrifugal Mill which I bought of you, I will say that I have run the mill four months on hard rock; and I take pleasure in adding that the mill has in every way given the best of satisfaction.

Yours truly, J. H. NEALE.

GARIBALDI MINE,
Calaveras Co., Cal., Dec. 17, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR:—In answer to your inquiry concerning the working of the five feet Centrifugal Mill, bought of you for the Garibaldi mine in Calaveras county, I take pleasure in saying it gives entire satisfaction in every respect, and I only regret that the mine does not warrant the purchase of more of them and the continued use of the one now in operation.

Very truly yours, O. B. SMITH.

F. A. Huntington Esq., San Francisco, Cal.—DEAR SIR—Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Co. property at Shingle Springs, El Dorado Co., Cal., about four months, and it has done good and satisfactory work, a greater proportion of gold remaining in the mill than in the stamp battery. FRED JONES, Supt.

HILDRETH RANCH, Fresno Co., Cal.,
January 11, 1884.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR—In regard to your mill (Centrifugal Roller), I have crushed about 500 tons of rock in the mill, and am glad to say that it has given entire satisfaction, and can recommend it to the public as the most expeditious and least expensive method for crushing and milling ore that I have ever seen. Truly yours,

THOS. HILDRETH.

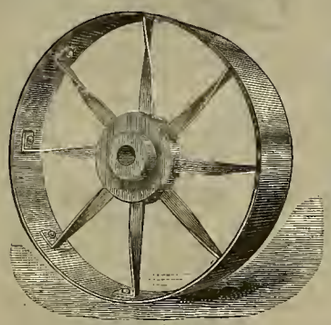
Iron and Machine Works.

MACBETH'S
—PATENT—
STEEL PULLEY.



Advantages of these Pulleys.

They are less than half the weight of cast-iron pulleys; are polished on the face; are made either crowned or straight, and are turned in the lathe the same as the best make of cast-iron pulleys.

They are carefully balanced. They are subject to no contraction strains, and can be run at very high speed without danger of bursting.

On account of their great lightness and the form of the arms, they absorb less power than any other pulley.

They are *the only pulley of the kind* which runs true. They cannot be broken in transport.

TESTIMONIAL:

MATHER LANE SPINNING CO. (Limited), LEIGH, ENGLAND, Nov. 5, 1883.

N. Macbeth, Esq.—Dear Sir: The Patent Steel Pulleys supplied throughout to our No. 2 Mill are working to our entire satisfaction.

They are very true, and are about 50 per cent lighter than the cast-iron pulleys in our No. 1 mill.

Yours faithfully,
For the Mather Lane Spinning Co. (Limited),
[Signed:] RICHARD T. MARSH,
Managing Director.

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE

Cheapest and Most Effective Machine

OF THE KIND NOW IN USE.

Adapted to All Grades and Classes of Ores

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is acquired—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coaser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

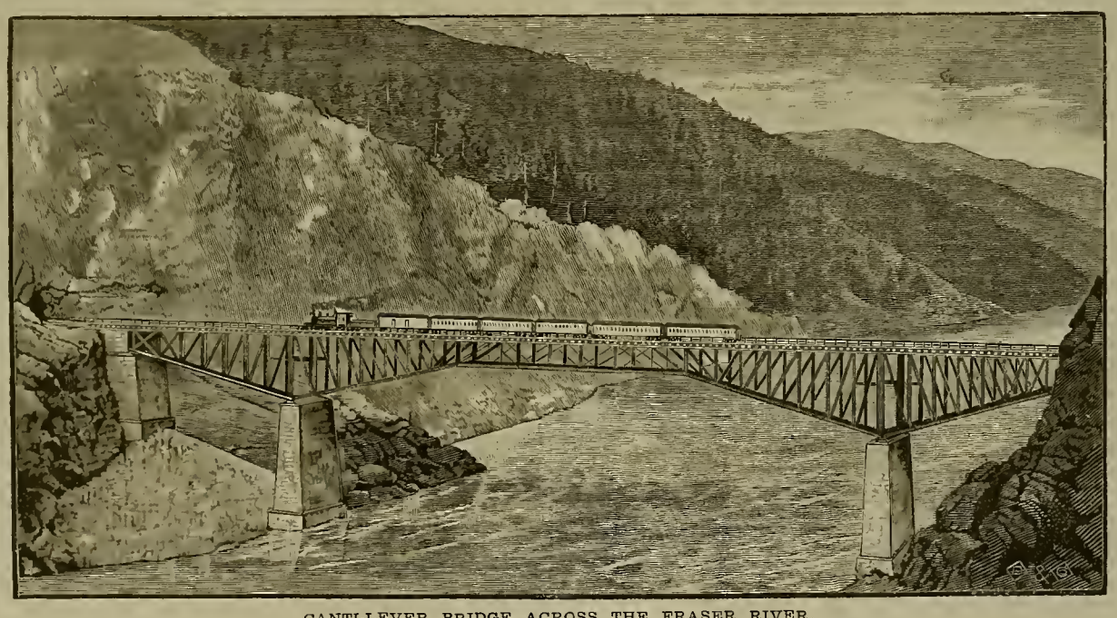
Canti-lever Bridge Across the Fraser River.

We place before our readers a view of another of these bridges, which has recently been thrown across Fraser river, below the town of Lytton, carrying the Canadian Pacific Railway. This is the second bridge of this description which has been constructed in the United States, and it is a matter of some interest to Californians to learn that the work was intrusted to Pacific coast engineers, the contract for its erection having been awarded to the San Francisco Bridge Company, of this city. Its construction is represented as one of the greatest feats accomplished in the course of the construction of this important continental railroad. It is also gratifying to learn that the work has been done to the entire satisfaction of Mr. Onderdonk, the general contractor for the road in B. C., and to the managers of the road themselves.

This Company has just completed the contract for all the bridging on the Pacific division of this road, representing 47 spans, at an aggregate cost of over $300,000. Amongst these is the bridge carrying this road over the Pitt river, containing 14 spans of a Howe truss, 2,280 feet long, the piers of which stand in rapid water 48 feet deep, and which, in winter, carries large fields of floating ice. This is the largest bridge west of the Rocky Mountains.



CANTI-LEVER BRIDGE ACROSS THE FRASER RIVER.

The design is what is known as the canti-lever bridge, the principle of which is that of a trussed beam, supported at or near its center, with the arms extending each way, and one end anchored or counterweighed to provide for unequal loading. It is in practice an entirely new design, no other bridge as yet having been completed upon this principle, except the bridge recently erected at Niagara Falls.

Each end is made up of a section, entirely of steel, extending from the shore nearly half way over the chasm. Each section is supported near its center by a strong masonry pier, from which extend two lever arms, one reaching the rocky bluffs, the other extending over the river 109 feet beyond the pier. The outer arm having no support, and being subject like the other to the weight of trains, a counter-advantage is given by the shore arm being firmly anchored to the rocks on the shore. The piers on either side rise from the water's edge; between them a clear span of 315 feet over the river. The ends of the canti-levers reaching on each side 215 feet from the abutments, leave a gap of 100 feet filled by an ordinary truss bridge hung from the ends of the canti-levers. Here provision is made for expansion and contraction by an ingenious arrangement between the ends of the truss bridge and of the canti-levers, allowing the ends to move freely as the temperature changes, but at the same time preserving perfect rigidity against side pressure from the wind. There are no guys for this purpose, as in a suspension bridge, but the structure is complete within itself. The total length of the bridge is 530 feet. It has a single track, and is built strong enough to carry a freight train of the heaviest kind extending the entire length of the bridge, headed by two "consolidation" engines, and under a side pressure of 30 pounds per square foot, which pressure is produced by a wind having a velocity of 75 miles per hour, and even then will be strained to only one-fifth of its ultimate capacity. The foundations rest on the solid rock; two pieces of masonry are carried up 96 feet above the surface of the water, supporting the canti-levers.

The structure has very much the appearance of an ordinary truss bridge, but, in view of the conditions and surroundings, very different in the manner of its erection. The piers on the water's edge and the shore arms of the canti-levers have, of course, been erected with the help of temporary falsework, rendering the erection of the superstructure comparatively easy. But after this comes the difficult portion of the work, *i. e.*, to span the 315 feet across and 135 feet above a roaring river, whose force no earthly power can stay. No temporary structure could survive a moment, and here the skill of the engineer came in to baffle nature and laugh at her powers. The design of the canti-lever is such that after the shore arm is completed and anchored, the river arm is built out, one panel or section at a time, by means of great traveling derricks, and self-sustaining as it progresses. After one panel of 25 feet is built and has its bracing adjusted, the traveling derrick is moved forward and another panel erected. Thus the work progresses, section by section, until the ends of the canti-lever are reached, when a truss bridge is swung across the gap of 100 feet, resting on the ends of the canti-lever arms, thus forming the connecting link. This great work will remain for ages an imperishable monument to the skill, enterprise and energy of the San Francisco Bridge Company.

This great work was carried out to successful completion without loss of life or accident of any kind, under the able supervision of the company's general superintendent, Mr. A. W. Sypott.

Referring to our illustration, we would state that the total length of the bridge is 530 feet, the central span being 315 feet long. The ends of the span rest upon piers of solid masonry, 96 feet high, and containing 6,480 cubic yards of stone. The superstructure contains 1,200,000 pounds, or 6,000 tons of cast steel and iron. The total cost was $280,000. The *West Shore*, of Portland, Or., in speaking of this structure, says: Though the bridge is not so long as the one at Niagara, the difficulty attending its erection was much greater, owing to the fact that the site could be approached from one end only. One-half the material was sent across the river on a steel cable one and one-fourth inches in diameter, several pieces thus transferred weighing over five and a half tons each. In this respect the bridge stands without a parallel in the world. The first iron was placed in position on the 17th of March, and on the 14th of June a train crossed over the completed structure; only 73 days, including those lost by reason of bad weather, were consumed in the transfer of iron across the stream and the erection of the entire bridge. As an example of speed and skill it is without a parallel, when the difficulties to be overcome are considered."

If all the bridges, which the company has constructed on this coast, were placed in line their aggregate length would span a stream eleven miles wide. This company is the largest contracting and engineering firm on the Pacific coast, and their undertakings have been very heavy and quite varied.

The company has also just completed at Roseburg, an iron combination bridge over the Umpqua river, 600 feet long, consisting of two spans of 200 feet each, standing on iron cylinder piers 40 feet high, which is the largest highway bridge in the State of Oregon. They have also under construction six spans of iron combination bridge, on iron piers, over the Los Angeles river, for the city of Los Angeles; and have contracts in various other counties of California, Oregon and British Columbia.

There is another work of this company in British Columbia which is deserving of special mention, because of its superior character, the difficulty attending its erection, and its importance to navigation; the Fraser river lighthouse on the Gulf of Georgia, between Vancouver island and the main land of British Columbia. This lighthouse stands five miles out at sea, and, like the famous Eddystone lighthouse, is always surrounded by a tempestuous sea. For many years the Government deemed it impracticable to erect a lighthouse at that point, and maintained a lightship there; but the enormous expense of so doing led to an effort to erect a lighthouse. A contract was let to the San Francisco Bridge Company by the Dominion Government of Canada, and the work was executed under the immediate supervision of Mr. J. McMullen, president of the company. Over treacherous and shifting sands the iron screw pile foundation is an admirable device for bridge foundations, marine piers and lighthouses. They can be screwed into the bottom to any desired depth, and offering the smallest possible resistance to the waves, make a reliable foundation. This device was adopted and the work performed in the most scientific manner. The lighthouse cost $43,000, and is an imperishable monument to the engineering skill of the contractors.

We take great pleasure in thus calling attention to the engineering achievements of this firm who have their office at No. 10 California street, in this city.

THE Bald Mountain Extension Company cleaned up at Forest City Monday 75 ounces. A two-ounce piece was found in a breast beyond the lava flow, where the gravel is supposed to be rich.

THE National Mining Exposition at Denver, recently closed, is said to have been a financial failure. The exposition of itself was good, but its patronage was disgustingly bad.

THE Big Bend Hydraulic Mining Company paid a dividend of $6,000 on the 6th. This makes $60,000 paid this year.

ANTIMONY is selling in Liverpool at £41 to £42 per ton.

CORRESPONDENCE.

We admit, uncensored, opinions of correspondents. EDS

Mining Around Benton, Mono Co., Cal.

[From our Traveling Correspondent.]

As there is but little prospecting going on at present, aside from the required assessment work in Indian, Clover and other outlying districts, a few words will suffice.

The ledges are represented in the main to be very large for this region, and to contain an immense quantity of rather low grade gold-bearing quartz, estimated by those at work to mill somewhere $10 to $20 per ton. There is every reason to believe that it will be made to pay at no distant day in the future.

Some work is being done on the eastern side of the valley in the vicinity of the somewhat famous Queen Mine, that has turned out in the past upwards of $1,000,000 in bullion, and if reports are true, is still far from being exhausted.

The Reward

Is one of the most promising mines of this neighborhood, showing croppings 100 feet in width, and giving a fine prospect for a large ore body when once fairly opened. A depth of 60 feet from the surface finds the ore lying in seams, each about a foot in width between layers of talcose slate. It is rich silver lead ore, with assays as high as $3,000 per ton. One shipment sometime ago of three tons, second class, netted $250 per ton; and five tons, first class, probably not far from $400, as the gross yield reached $600 per ton. Mr. John Kremkon, of Benton, informs me that he is on the eve of shipping six tons of a similar character to Selby & Co., of your city, for reduction. This lot is expected to yield not less than $500 per ton gross.

The principal mining in the immediate vicinity of Benton is confined, as in the past, to what is generally known as

The Blind Spring Hill.

It has yielded in the gross (assay value) according to a calculation of one of the oldest and most experienced miners of the place, not less than $5,000,000 in bullion. It was taken out, mostly shipped and reduced at a great cost to the owners, when prices for everything were very high and the disadvantages for working were greatest. The mines are ranged along and on each side of a long high ridge 1,200 feet above the bed of the C. & C. R. R. and over 6,000 feet above the sea level. The lodges run nearly north and south with the mountain and usually parallel, more particularly on the eastern slope. The country on the west side interiorly, to all appearances, has undergone in places a greater or less degree of disturbance. The old Comanche lode, running along the center of the ridge, has a slight eastern dip, becoming nearly perpendicular as depth was attained. It is looked upon here as a true fissure vein, as well as one of very great value. All the ledges east of this, dip with a greater or less angle to the east. All on the opposite side are thought to have a western dip, with the exception of one or more which seem, so far as open to view, to have assumed a position as nearly horizontal as possible.

Beginning with mines at present in active operation on the west side, the following report speaks for itself at the date on which it was written:

BENTON, Sept. 27, 1884.

We have been doing a great deal of dead work and putting the mine in shape for the last three months, in order to work it to advantage and for the benefit of the company. We expect to commence taking out ore next week and in a month from now will be able to keep the mill running on $200 rock.

W. H. RUSSELL, Supt. of the Co.

Your correspondent may add that the lode as witnessed, varies in width from 5 inches to 2½ feet. It is understood that the ore, probably selected, has gone much higher than the above estimate of the superintendent. The original location under another name is said to have turned out in the neighborhood of $400,000. A short distance from this mine, Mr. John Tucker is busily at work on

The Eastern Star,

With excellent results and more splendid prospects in anticipation. He has from 2 to 3 feet of very rich ore, all of which is extracted for reduction. Shipments heretofore made reached $228 per ton. He is about to send off 4½ tons, which he fully believes will work over $600 per ton, as the ore is rapidly improving as the exploration of the mine progresses. One large piece of ore now lying before me, weighing 84 pounds, is estimated by the best local experts to work at the rate of $700 per ton, while a smaller specimen, much of it pure horn silver, will go $1 per pound, or at the rate of $2,000 to the ton.

Turning to the eastern slope of Blind Spring Hill, we find Mr. J. F. Millner, of Benton, vigorously prosecuting work on

The Borasca Mine.

It is thought to be valuable property. Like all the lodes of this district, it lies mostly in granite, accompanied in some places with more or less porphyry. One vein averagos two and a half feet. The whole of the contents as taken from mine works from $125 to $150 per ton. First-class assorted ore mills $500 per ton. Thus far about $16,000 have been realized.

Teams are at this writing daily hauling to the 5-stamp mill in Benton of

The Wai Wera M. & M. Co,

Which is expected to start up within a few days. But little has been done for some time by the last named company owing to the cost of hauling wood and water. It has been opened to the depth of 900 feet and has yielded (assay value) on good authority more than $1,500,000.

The *Cornucopia*, next lode east, I believe, has produced about $400,000. Four tons second class taken out last fall, worked $125 per ton and 3 tons first-class $1,099.50 per ton.

The *Comanche*, lying next on the west of the Wai Wera, and mentioned before, supposed by many to be the mother lode of the hill (although at present lying idle), is said to have produced one and a half millions in bullion. Over $300,000 have come from the *Lyford*, and from $1,500 to $2,000 from the *Moran*.

A Grand Project

With the probabilities greatly in favor of its proving a very profitable one, has been for sometime under contemplation and is now awaiting accomplishment at the hands of some energetic capitalist who is willing to share some little risk with the miners of Benton.

It is no less than to start a single track tunnel at the eastern base of the mountain within one-half mile of the C. & C. R. R. track, and run through Blind Spring Hill from east and west, tapping all the ledges in its course, or such as may go down to its level. It would thoroughly drain and divellen all the mines and give easy exit for all the ore for shipment by the railroad or to be worked at mills that may be hereafter erected convenient to the mouth of the tunnel. It will strike the following ledges in the order and at the depth named. The Moran at perpendicular depth of 200 feet, the Lyford at 800 feet the Cornucopia, 1200, the Wai Wera about 1200 and the Comanche at about 1,100 feet owing to a depression in the hill at its location.

A calculation has been made that the cost need not exceed $100,000, which is but a trifle in comparison with the vast treasures that may be very reasonably supposed to yet lie uncovered in this hitherto large storehouse of wealth. A. C. K.

Benton, Mono Co. Cal.

Deadwood, Trinity County.

EDITORS PRESS: I have noticed in your last issue that glowing accounts are being given of outside mining industries beyond the limits of California, and seldom do the public hear of the numerous mines being worked profitably in parts of our own State that deserve more than a passing notice. Should you permit me to trespass on your valuable space I shall try and give you an outline of the mining industry of Deadwood. This camp is located in the eastern part of Trinity county, in the Trinity range of mountains. Its altitude is about 3,000 feet above the level of the sea. A small rivulet wends its way from the foot of these mountains and empties into Trinity river, about five miles from its source. It was mined in early days for the placer gold it contained and yielded handsomely. Quartz mining has been going on here for the last 10 years, the old primitive arastra having made many an honest miner happy.

Recently several mills have been built of small capacities. McDonald Bros. & Co. put up a five stamp mill this summer, and in three months they have cleaned up nearly $100,000. Their ledge is from two to four feet wide, and all yields nearly $200 per ton. They have sunk a shaft 100 feet from their first tunnel, which they drove in the mountain, and the ledge is simply immense all the way down. Other properties in this district are now looming up. George Cloyne has a mill on his mine, and it yields him a splendid profit. Mr. Davidson also is extracting ore for his Cannon Ball mill. Another mill is being constructed by Mr. Murdock. Several others, too numerous to mention, have good properties here, but all of these men are practical miners. They need no capital to help them to put up an arastra, and when they realize enough out of the mine they erect a mill. Another property I forget to mention is Mr. Lapan's. His ledge is about two feet wide, and in some places very rich. He also has discovered two cross ledges, which are running towards the main vein. He is now engaged in extracting ore to run his arastra as soon as the rainy season commences. The general formation of this district is porphyry and slate. All the rock contains a trace of silver, but not enough to notice. It contains no rebellious substances, so that an arastra, or plain gold mill, does the work to perfection. Should such a showing be made as we have here by some of our mining speculators, who try to make a boom where distance lends enchantment, they would have a mining town, mining companies formed, incorporating with capital stock 10 millions, and other Lady Bryan and Alta swindles would come to light, but the days of gambling in mining are over. By working mining properties in a legitimate manner we shall yet bring California to the front as a gold producer. P. F. Mc.

The Concentrator Controversy.

At the request of Adams & Carlin, Pacific Coast agents for the Frue Vanner, we reproduce the following correspondence from the N. Y. *Engineering and Mining Journal:*

In your last issue, there was an article purporting to give results obtained at the Carlisle mill, in New Mexico, in a competition of the above-named machines on the tailings of a gold mill. While not denying that it is *possible* to so run a Frue vanner that a Duncan concentrator would give better results, I am able to give a few facts in regard to the special test quoted, that will be of interest to any one accepting the same as a real comparison of the two machines.

In the first place, the Duncan concentrator is a large pan, which has, according to its maker's description, "two motions—an irregular centrifugal, and an oscillating." The vanner it is not necessary to describe, nor its successful work on finely crushed mineral, as over 200 are at work in California alone on gold mill tailings, and have there replaced all other concentrators in general estimation. During the last 20 years, dozens of pan concentrators have been invented, patented and introduced, and, later, disappeared from view. They are all based on an hydraulic miner's idea of concentration, namely, that a gold pan is the ideal form, whereas all concentrator men, used to dressing slimes and finely crushed mineral, are aware that the gold pan is of little use, even in the most experienced hands, except on gold amalgam. So much as to the probabilities in the case of a test on stamp-mill tailings between a pan machine and a belt machine, when finely divided sulphurets have to saved.

Last fall our Denver agent visited the Carlisle mill, and found the Duncan concentrators in use. The ore was good, the sulphurets rich, and the tailings of the Duncan concentrators were also valuable: The field for improvement was so excellent that Frue vanners were offered on liberal terms to treat the tailings of the Duncan concentrators, and in October an agreement was signed with the Carlisle Mining Company, of which the following extract will convey the substance: "The machines (5) are to be paid for at the rate of ——— (the regular selling price at that time), for five machines, in the following manner: after the said machines are entered in the mill of the party of the first part, at the Carlisle mine, they shall be used to concentrate the tailings from all other machines now used for concentrating in said mill of said company, and the produce therefrom, less $35 per ton, shall be used and appropriated to the payment of such machines, until the said sum of ——— is paid to the party of the second part. And it is mutually agreed by the parties hereto, that if the said machines should not prove satisfactory to the party of the first part, he may at his option return the same by properly packing same and paying the freight on same to Denver, Colorado, or Chicago, Ill., and no payment shall be demanded by the party of the second part, provided that said machines are loaded on cars at Lordsburg, New Mexico, within 40 days from the time said machines are started in said mill."

The power of returning the Frue vanners was thus left entirely with the mining company; but in the final settlement no regard seems to have been paid to the letter of the agreement, our agent apparently being perfectly satisfied with the fact of machines not being returned, and hearing from one of the directors that they were doing exceptionally good work; the members of the company being also known as responsible men. Now, it seems from the article published by you, and contained in a circular distributed by makers of Duncan concentrator, that in a trial of the two machines at the Carlisle mill in the months of *February* and *March*, the Duncan machines proved vastly superior to the vanners. Yet the vanners were never returned by the Carlisle Mining Company, and on *February* 28th three more vanners were ordered from Chicago, and on *April* 7th two more were ordered. Curious result of such a test! especially as the vanners are more expensive to buy than the Duncan.

Two points about the test described may be noted. The value per ton of concentrations is a little higher for the Duncan than for the vanner. Any man who has seen the two machines run will open his eyes at this; and any one who has seen the vanner run will be scientifically interested to find that at last a concentrator has been found that will make sulphurets cleaner than pure. As to amalgam quoted in tests, the vanners were not ordered for saving this, as it was expected the amalgamator would keep it on his coppers; but even if, through occasional carelessness at battery or some special difficulty with ore, amalgam is expected at concentrators, we have long ago found that substituting a copper plate, having ½-inch rillles across top and bottom for ordinary pulp distributor on vanner, made the most effective amalgam concentrator possible to conceive, the shaking motion rolling it into small pellets under the rifles in a form impossible to lose again. For floured quicksilver, as witness the treatment of pan mill tailings, the vanner can not be excelled. On globular quicksilver, we admit being weak; it rolls down the belt when too large; but the mill man who can not save globules of quicksilver without a concentrator should direct his attention to some other business.

We shall be pleased to make a similar agreement as that above mentioned with the Carlisle Company with any mill having stamps, sulphurets that will concentrate a value of at least $100 per ton, and using concentrators of the pan form, in not larger number than the vanners would be employed—say from two to five stamps. Yours truly,

WALTER MCDERMOTT,
General Agent.

Mining in Inyo

In the mountains on both sides of Owens valley, there are hundreds of well-known ledges of gold and silver bearing ores that are not worked. Many of these ledges contain what would in other districts be classed as high grade ores. The claims are mostly owned by poor men, and in this fact the cause is found why the mines are not worked. Discoverers of the ledges were mostly men who had gained their mining experience in the placer claims or free gold quartz mines on the western slope of the Sierra. The same methods they had seen used for extracting gold were tried here but as the ores are entirely different, failure was a necessary result. Some experiments were made to discover a method that would extract the gold or silver from the ore, but for want of sufficient capital, these experiments were not carried far enough, and work on the mines was suspended. Many of the mining claims came into possession of parties in San Francisco and elsewhere, men who had money enough to experiment with, but it would appear that each was waiting for the other to make the experiments. In the mean time these parties maintain their titles to the mines by doing the necessary assessment work, so that they may profit by the boom that is sure to follow the introduction of a successful method of working these ores. It will doubtless be found that many localities which at the present time have received hasty condemnation, and are idle and neglected in consequence of an unfavorable report, will, when a better understanding and knowledge prevails, be opened up and proven of most substantial wealth and value, when their real wealth and methods of working it have been mastered. It is true that a few mines in the country have produced millions of dollars, even with the imperfect means used for the extraction of the metals; but so far in the history of its partial development, it is as if a field which requires the most careful culture should produce a promising crop when no cultivation has been given. It would only be taken as a proof of the natural richness and productiveness of the ground. So the results in the mining history of this county, instead of being taken as a measure of its returns to be expected from its development, should rather be received as an estimate of its probabilities and a proof of its great advantage, because as a matter of fact the result produced have been generally secured without the use of these things which are most necessary to its real and substantial development.— *Inyo Independent.*

Roger's New Steam Quartz Mill.

The new steam quartz mill built Patrick Rogers, at Boston Ravine, started up for regular work yesterday, commencing the crushing of rock from the Crown Point quartz mine. Ground was broken for this mill on the 15th of August and in just seven weeks it was ready for regular operations. The mill stands nearly opposite the mouth of Rhode Island Ravine, and is situated between the main road and Wolf creek, with the fall from the batteries toward the creek. The foundation for the batteries and engine are solid masonry work built 12 feet in hight from the bed-rock. There are two five-stamp batteries with iron mortars, the stamps and stems weighing 800 pounds each. The batteries are fed by two Hendy self-feeders. The amalgamating plates, and the pulp passes from the sluices into Hendy concentrators, and the concentrations are worked through two Knox pans. A complete system of sluices is also connected with the mill, and everything is well and neatly arranged for doing perfect work. The power to drive the mill is an engine with cylinder of 12 inch diameter and 20-inch stroke; the boiler being a 46-inch tubular 16 feet long. The mill building is 22 by 30 feet, and the boiler shed 12 by 30 feet. In front of the batteries and running on a level to the road is a heavy and strong platform upon which to dump the quartz, upon which teams can drive to discharge their loads. Attached to the mill is a large yard for the storage of wood with which to run the engine. The builder of the mill was Jos. A. Evans, who has done much excellent work of this kind in the district. Patrick Rogers, the owner, has superintended the general construction and will superintend the running of the mill. A. Calahan is the engineer and machinist. The mill is intended for custom work, and is well located for that purpose, being central to the mines of the district, and a point to which hauling can be done at the most favorable rates.—*Grass Valley Union.*

THE BULLION product of Tuscarora for the month of September, reaches a grand total of $90,572.58. Of this amount the Najavo shipped $65,072.58, and the Grand Prize $25,50

MECHANICAL PROGRESS.

idden Flaws in Metal.

What really needed, says the *London Builder*, is some system, could such be devised, by which those hidden flaws which the very best metal made by the very best process will sometimes contain, should be rendered patent to the eye of an inspector. Is there any chance of such a system being devised? It is clear that chemical tests are quite useless; they can tell nothing as to the general composition of the metal. Electrical tests may possibly yet be used with effect. They were proposed some years ago and have been revived lately by Prof. Hughes, the inventor of the microphone. With his beautiful instrument, the "magnetic balance," he has proved that in wires or small pieces of iron, almost all peculiarities of the metal, including the existence of flaws, can be detected with ease and certainty. His invention has been freely given to the world, but heretofore the world (as usual) has been wholly indifferent to the gift. So far as we are aware, no railway or marine engineer has taken any steps with a view to ascertain whether a similar system might not be applied to pieces of large size such as those required in actual work. Failing this, mechanical tests in a proper testing machine do not seem impossible. If the axle which broke at Penistone, before having been set to work, had been subjected to a sudden cross-breaking strain, similar to that which caused its destruction, but very much below what it should be able to support with safety, we cannot doubt that the resulting deflection or bending would have been far greater than if the axle had been sound. What we would suggest, therefore, is that all crank axles, or other pieces of metal called to fill equally important positions, should be tested by strains similar to those brought upon them in actual work, and that their deflections under those strains should be recorded. A few experiments would be sufficient to show clearly how great this deflection should be in the case of a sound and perfect axle; and if any specimen showed a deflection decidedly higher than the limit, it should be rejected as a doubtful quality. The expense of such a system would not be great when it once became a regular part of the manufacture of an axle; and it appears to us the only method by which a single faulty specimen can be weeded out from a batch of sound and satisfactory articles.

Making Changes in Machinery.

How easy, says the Boston *Journal of Commerce*, a workman can recommend a change in the working parts of a machine, after everything has been adjusted and left in working order by those who were sent with the machinery from the works of the builder, and how easily he can make the attempt to correct the apparent disorder by making a few slight improvements. Machines have been delivered with full instructions for running them, and been returned for the reason that there were working parts that were left in doubt by some additional improvements. The engine lathe, with a dead center that could be easily removed by running back the spindle with the hand wheel, must be divided for a pin wedge by the lathe man before he finds out that such a thing was not needed. Cutter-heads with the driving spindle have been boxed up and shipped for the purpose of having a collar to guard against an end movement, where the builder had made provisions for this very difficulty by turning V grooves in the bearings of the spindles. And so with the machines for the working of cotton. Some familiar part must be entirely remodeled so as to accord with the ancient idea with which the attendant is more familiar, and often costly attachments may be found laid aside which were intended for a purpose, with the use of which no one was acquainted; and even machines have been fitted for different grades of material by making some additional arrangement in the working of the machine, when all the while provisions were made for this very purpose. When the machinery from a reliable firm will not operate in accordance with the notions of the attendants it would be proper to inform the parties whose interests lie in the proper working of the machine, and let them remove the difficulty, if any exists, and explain some of the mysteries of the one-sided catches that have been made use of, that the production may be benefited as well as the workmen, without discredit to either.

On Working Steel.

A correspondent of the *Blacksmith and Wheelwright* writes that journal as follows: Allow me to express a few thoughts in regard to the degree of heat steel should be worked for edge tools. And in doing so I shall no doubt differ with many, but what of that? If we all had one way of doing work what would be the use in giving *our method*" for doing anything? Some tell that steel should never be heated above a cherry-red, others say it should not be hot enough to scale, and many suppose if heated to a white heat the steel is burnt and is utterly worthless. Now, if all this be true, how in the world can a edge tool ever be made, and of what practical use would they be when they were made.

Can steel be put into an ax or any other tool without heating the steel above a cherry-red heat? If so, I would like to have some one tell me how, as I have never learned that part of the trade. It will be of no use to cite the "cherry heat welding compound," as I have had a box of that in my shop for years, and would be glad to dispose of it at a low price, unless the manufacturer will come and show me how to use it. I do not believe that iron or steel can be welded at a cherry heat.

My experience in the working of steel during the past 15 years has been mostly confined to the ax business. I have made and repaired during this time several hundreds of axes, and the work has given unparalelled satisfaction. My experience in the matter has convinced me that the degree of heat steel should be worked, depends very much upon circumstances. For instance, if I am going to fix over an ax, and wish to reduce the steel to one-half or three-fourths of its present thickness, I have no fears of any bad results if the steel is brought to a white heat to commence with. But when nearly to the acquired thickness, I am careful not to heat above a cherry-red. And when the last or finishing touch is given by the hammer it is at a low heat, when but a faint red is discernible. I never finish forging an edge tool of any kind at a cherry-red heat. The finishing should be done at as low a heat as to refine the steel and leave it bright and glossy. In heating to temper the greatest care should be observed that an even cherry-wood heat is obtained. I do not deny that injury may occur by overheating. This every smith knows to be true; but I *do* claim that it can be remedied, and the fine grain of the steel restored when the nature of the work will admit of a suitable amount of forging. When it will not, I never heat above a cherry-red. Come, friends, let us hear from you on this and other subjects. Supposing we do make blunders and expose our ignorance once in a while. We may become enlighted and do better, as no one is too old to learn.

DIAMOND TURNING TOOLS.—It is sometimes desirable to reduce the dimensions of a hardened steel article that has received a lathe finish without first drawing the temper, as this necessitates a rehardeuing and retempering. The usual method of lathe reducing of hardened steel articles by corundum wheel grinding is necessarily confined to straights or tapers, no offsets, collets, or shoulders being amenable to this style of work. A model maker and bright mechanic has succeeded in utilizing the black diamond, or bort, as a turning tool for hardened steel. He places a crystal in the end of a piece of iron or brass for flat turning, and one on the side of the end, or on a corner of the end, for side or shoulder turning. He has succeeded in doing some good work with these crude-looking tools. The chips taken from the hardened steel are literally chips, not turnings, and are very minute. But viewed under the microscope they are seen to be cut from the hardened steel, and not merely disengaged crystals. One of the specimens of work with these bort tools is a well finished V-thread, about 32 to the inch. Two differing crystals of the diamond were employed to cut and true the thread. An adaptation of bort tools to the planer is evidently possible, and there seems to be no reason why its use might not be extended with economical results in the treatment of hardened steel and of chilled iron.—*Scientific American.*

COVERED AND UNCOVERED BOILERS.—In order to ascertain the degree of advantage obtainable by felting and lagging steam boilers, Mr. B. H. Thwaite has carefully carried out the following experiments on a Bull type of vertical boiler: A definite quantity of water was poured into a vessel of a size sufficient to cover one square foot of plate surface, the vessel being externally lined with wood. The rise in degrees of heat during the hour's exposure was noted. The same weight of water, with identical initial temperature, was then placed for the same time on the surface of the lagging, which consisted of three thicknesses of three-eighths inch felt, covered with one-half inch tongued and grooved battens. On the naked plate it was found that 516·75 heat units per square foot were absorbed by the water; and on the laggard portion only 145·75 units per square foot were given off. This is equivalent to a reduction of wasteful radiation, due to the lagging, of 34 per cent, or with a vertical boiler, say 4 feet in diameter and 9 feet in hight, working for 10 hours, there would be saving, due to the lagging, of at least 70 pounds of coal.

IMPROVEMENTS IN STEAM ENGINES.—A writer in one of the mechanical journals expresses the opinion that, taking the best types of steam engines at the present time, some departures are called for in order to realize still greater efficiency and economy. Among the most important points made by this writer is that of the necessity of increasing the ability of the boiler to withstand pressure without adding to its cost, rather than augment its comparative power; also to decrease the friction of the engine and of the transmission to the point where the useful work is delivered. In addition to these requisites, it is urged that better vacuums should be produced in the condenser, and its cost diminished; the expense of the engine must also be lessened, as well as that of the attendance, alike on engine, boilers and machinery, and of lubrication; and there is likewise a greater degree of durability called for in construction.

SCIENTIFIC PROGRESS.

The Philadelphia Electrical Exhibition.

The International Electrical Exhibition recently given under the direction of the Franklin Institute was, by universal admission, the most valuable and successful exhibition ever undertaken by private enterprise in the United States, when considered from an educational standpoint. The *Journal* of the Institute says of it: "The direct value of the Exhibition as a means of education has been utilized to the highest possible degree. The Board of Public Education of the city of Philadelphia has directed each of the schools of and above the grade of grammar school within its control, to take a day to visit the Exhibition with its teachers, in lieu of a school session; and, in response to invitations sent by the officers of the Exhibition to the directors of schools within a radius of one hundred miles, embracing Eastern Pennsylvania, New Jersey, Delaware and Eastern Maryland, a large number of pupils with their teachers have availed themselves of the opportunity of visiting the Exhibition. To assist to an intelligible study of the machinery and apparatus, a series of "Electrical Primers" was prepared, giving in simple and readily comprehensible language, explanations of the principles, construction and operation of the principal groups of exhibits, and placards were posted conspicuously in the neighborhood of characteristic machines, etc., to identify them by name to those to whom they were unfamiliar. The primers, which were issued and sold at a nominal price, proved their usefulness by an enormous sale.

The educational character of the Exhibition was furthermore pronounced by a series of lectures given twice a week in the large lecture hall. These lectures, which were delivered by men of eminence upon topics related directly or indirectly to the subject of electricity, were listened to by crowded audiences and proved to be highly popular. They will be published in a special volume."

ELECTRICITY A TRUE FLOW AND NOT A MERE VIBRATION.—According to the French *Annals of Chemistry and Physics*, Decharme has instituted some experiments showing a hydrodynamic imitation of electric phenomena. He imitated by liquid or gaseous currents, the principal phenomena of static and dynamic electricity, electromagnetism, electrodynamics, induction, electrochemistry, and even electrophysiology, concludes that electric and magnetic phenomena are similar to hydrodynamic phenomena; in other words that electricity, under the form of an æthereal or ponderable current, is analogous to a liquid current, and, when in a state of tension, resembles a quantity of liquid diffusing in a jet. Electric movement is then a true flow and not a mere vibration. Its equipotential lines may be exactly represented by Lamé's differential equation for the curves of hydraulic level. There are some electric phenomena, however, which appear to be the result of vibratory and gyratory movements; but these movements naturally result from the transformation of wave motion in a continuous current.

IMPORTING AMERICAN GRAPES INTO FRANCE.—Ch. Joly has presented a paper to the *Societe d' Horticulture*, upon the importation of muscat grapes from the United States into France. The grapes were preserved in an aqueous solution of glucose. The attention of the grape growers of France and Algiers is invited to the important consequences which may follow this importation. The United States, outside of their enormous grain trade, have hitherto been limited to the export of fruits prepared by a previous drying, which removes about 28 per cent. of the water that they contain; this operation has the double advantage of diminishing the weight to be transported and of facilitating the preservation of the fruit. M. Joly, while calling attention to the danger of an interference with the French grape trade, urges cultivators to increase their productions as much as possible, chiefly by the rational amelioration of their methods of culture.—*Nature, May 3.*

HATCHING CHICKENS BY ELECTRICITY.—According to *Nature* an interesting experiment in the use of electricity in hatching chickens has recently been tried at Berlin. A basket was provided containing a nest of hay, properly covered and provided underneath with a thick pillow which contained a metallic spiral. A battery of six cells furnished the electricity for warming the spiral, the current passing through a lever regulator. A small thermometer was inserted with the bulb in the nest, and a fine platinum wire soldered to the tube. When the temperature became too high, the mercury would rise and touch the wire, forming a contact which would throw the apparatus out of circuit. When it cooled again the current would be restored and the temperature raised. By this device an approximately even temperature was maintained by which the hatching was perfected.

MAGNESIUM VS. ELECTRIC LIGHT.—It is stated that magnesium bids fair to come into important use as a light producing agent for marine purposes, as it is found that its rays have a greater penetrating power in fogs and mists than even those of the electric light. It may be interesting in this connection to state that M. Gratzel, who has recently obtained a patent for the separation of alkaline metals by electrolysis, has been very successful in the reduction of magnesium. At a late sitting of the *Electrotechnische Verein*, in Berlin, a ball of magnesium, of about 15 centimeters diameter, excited general attention. It was of superb brilliancy, similar to that of silver, and had lost nothing of its lustre since its separation by electrolysis. This preservation is a sign of its chemical purity, and forms a remarkable contrast with the magnesium hitherto obtained, which was always more or less affected by potassium, and consequently easily oxidized, especially in a damp atmosphere.

THE SEA LEVEL.—Of late years automatic instruments—tide gauges—have been used for registering the level of the ocean at stated periods. All the principal European Governments and our own are engaged in these observations and measurements. The French Commission has begun a work of this kind, which, it is said, will surpass anything of the kind hitherto undertaken. In Belgium measurements have been made for 8,477 different locations. The measurements have been made in Holland with the greatest exactness. The level of the north sea has not varied for 250 years. The level of the Baltic is the same as in 1826. An interesting point will soon be determined as to the difference of level between the Baltic and Black seas. The Spanish operations have shown that the Atlantic ocean, at Santander is 0.582 meters above that of the Mediterranean at Alicant.

A NEW GAS BURNER, invented jointly by the late William Siemens and his brother Frederic, has recently been perfected by the latter, and is now known as the "Siemen's regenerative gas burner." The principle of the invention consists in heating to a high degree both the air and gas previous to combustion, the heating being effected by the waste products of the combustion. The great merit of the invention consists in a great increase of illumination with a diminished consumption of gas. It is claimed that with a jet which, burned in the ordinary way, will yield only three or four candle power, will, by the use of this new device, yield a 10-candle light. It is claimed to be a decisive step in advance in the use of gas, and one involving several novel and scientifically correct principles.

ARTIFICIAL GRAPHITE.—According to a French journal, Dr. Aron has exhibited, at the meeting of the Berlin Electrical Society, various specimens of vegetable carbon, which were made conductors and rendered almost incombustible by energetic and prolonged heating in a vacuum or in a neutral atmosphere. These properties are so much like those of graphite that the product may well be called artificial graphite, although it is not crystalline. The experiments show that if, as has been affirmed, the presence of hydrogen in graphite determines its combustibility, this can be true only of combined hydrogen, for carbon which has been calcined and made incandescent in an atmosphere of hydrogen is no more combustible than before.

REMARKABLE PHOTOGRAPHS.—Some remarkable photographs of a pistol bullet in its flight, under the illumination of an electric spark, has been secured by Prof. E. Mach, of Prague. He has also photographed the air streams which one may see over a Bunsen burner placed in sunshine; and has even obtained pictures of *waves of sound.* These last being made visible by a method in which advantage is taken of the irregular refraction of light by the waves set in vibration by sound. Although these experiments may not have any practical value, they are interesting as showing the great degree of perfection to which the photographic art has been carried.

STUDYING THE OYSTER BY TREPANNING.—Bauchon Brandeley, in order to study the embryonic growth of the oyster, perforated the upper shells by means of a trepan. After the hole is made and the particles of the shell carefully removed a stopper is prepared of linen, wax or some other material, to exclude the water and the enemies of the oyster. The shell is reconstructed by a thin layer of pearl in about eight days. In order to prevent the growth being too rapid while the observations are going on, the stopper is turned around every two or three days.—*Les Mondes.*

VOLCANIC INTERRUPTIONS OF TELEPHONES.—New and interesting phenomena are constantly coming to light in connection with the great volcanic disturbance, Krokatoa. A French electrical light journal says that during the eruption telephonic communication was almost impossible in the city of Singapore, which is located 500 miles distant from Krokatoa. On a subterranean cable, of about two miles in length, the words were drowned by a peculiar noise, which sounded like pistol shots. The phenomenon appeared to be of an electric nature, rather than acoustic.

THE SUPPOSED TRANS-NEPTUNIAN PLANET.—Flammarion, who has long been engaged in investigating the probabilities of a trans-Neptunian planet, has published the results of his work. He thinks there is no doubt of its existence and that it will finally be discovered, but not for some years to come; that it will appear as a star of the twelfth magnitude, and quite large enough to be seen and followed by many telescopes now in use.

CORRESPONDENCE.

We admit, uncondorsed, opinions of correspondents.—EDS

Mining Around Benton, Mono Co., Cal.

[From our Traveling Correspondent.]

As there is but little prospecting going on at present, aside from the required assessment work in Indian, Clover and other outlying districts, a few words will suffice.

The ledges are represented in the main to be very large for this region, and to contain an immense quantity of rather low grade gold-bearing quartz, estimated by those at work to mill somewhere $10 to $20 per ton. There is every reason to believe that it will be made to pay at no distant day in the future.

Some work is being done on the eastern side of the valley in the vicinity of the somewhat famous Queeu Mine, that has turned out in the past upwards of $1,000,000 in bullion, and if reports are true, is still far from being exhausted.

The Reward

Is one of the most promising mines of this neighborhood, showing croppings 100 feet in width, and giving a fine prospect for a large ore body when once fairly opened. A depth of 60 feet from the surface finds the ore lying in seams, each about a foot in width between layers of talcose slate. It is rich silver lead ore, with assays as high as $3,000 per ton. One shipment sometime ago of three tons, second class, netted $250 per ton; and five tons, first class, probably not far from $400, as the gross yield reached $600 per ton. Mr. John Kremkon, of Benton, informs me that he is on the eve of shipping six tons of a similar character to Selby & Co., of your city, for reduction. This lot is expected to yield not less than $500 per ton gross.

The principal mining in the immediate vicinity of Benton is confined, as in the past, to what is generally known as

The Blind Spring Hill.

It has yielded in the gross (assay value) according to a calculation of one of the oldest and most experienced miners of the place, not less than $5,000,000 in bullion. It was taken out, mostly shipped and reduced at a great cost to the owners, when prices for everything were very high and the disadvantages for working were greatest. The mines are ranged along and on each side of a long high ridge 1,200 feet above the bed of the C. & C. R. R. and over 6,000 feet above the sea level. The ledges run nearly north and south with the mountain and usually parallel, more particularly on the eastern slope. The country on the west side interiorly, to all appearances, has undergone in places a greater or less degree of disturbance. The old Comanche lode, running along the center of the ridge, has a slight eastern dip, becoming nearly perpendicular as depth was attained. It is looked upon here as a true fissure vein, as well as one of very great value. All the ledges east of this, dip with a greater or less angle to the east. All on the opposite side are thought to have a western dip, with the exception of one or more which seem, so far as open to view, to have assumed a position as nearly horizontal as possible.

Beginning with mines at present in active operation on the west side, the following report speaks for itself at the date on which it was written:

BENTON, Sept. 27, 1884.

We have been doing a great deal of dead work and putting the mine in shape for the last three months, in order to work it to advantage and for the benefit of the company. We expect to commence taking out ore next week and in a month from now will be able to keep the mill running on $200 rock.

W. H. RUSSELL, Supt. of the Co.

Your correspondent may add that the lode as witnessed, varies in width from 5 inches to 2½ feet. It is understood that the ore, probably selected, has gone much higher than the above estimate of the superintendent. The original location under another name is said to have turned out in the neighborhood of $400,000. A short distance from this mine, Mr. John Tucker is busily at work on

The Eastern Star,

With excellent results and more splendid prospects in anticipation. He has from 2 to 3 feet of very rich ore, all of which is extracted for reduction. Shipments heretofore made reached $228 per ton. He is about to scud off 4½ tons, which he fully believes will work over $600 per ton, as the ore is rapidly improving as the exploration of the mine progresses. One large piece of ore now lying before me, weighing 84 pounds, is estimated by the best local experts to work at the rate of $700 per ton, while a smaller specimen, much of it pure horn silver, will go $1 per pound, or at the rate of $2,000 to the ton.

Turning to the eastern slope of Blind Spring Hill, we find Mr. J. F. Millner, of Benton, vigorously prosecuting work on

The Borasca Mine.

It is thought to be valuable property. Like all the lodes of this district, it lies mostly in granite, accompanied in some places with more or less porphyry. One vein averages two and a half feet. The whole of the contents as taken from mine works from $125 to $150 per ton. First-class assorted ore mills $500 per ton. Thus far about $16,000 have been realized.

Teams are at this writing daily hauling to the 5-stamp mill in Benton of

The Wai Wera M. & M. Co.,

Which is expected to start up within a few days. But little has been done for some time by the last named company owing to the cost of hauling wood and water. It has been opened to the depth of 900 feet and has yielded (assay value) on good authority more than $1,500,000.

The *Cornucopia*, next lode east, I believe, has produced about $400,000. Four tons second class taken out last fall, worked $125 per ton and 3 tons first-class $1,099.50 per ton.

The *Comanche*, lying next on the west of the Wai Wera, and mentioned before, supposed by many to be the mother lode of the hill (although at present lying idle), is said to have produced one and a half millions in bullion. Over $300,000 have come from the *Lyford*, and from $1,500 to $2,000 from the *Moran*.

A Grand Project

With the probabilities greatly in favor of its proving a very profitable one, has been for sometime under contemplation and is now awaiting accomplishment at the hands of some energetic capitalist who is willing to share some little risk with the miners of Benton.

It is no less than to start a single track tunnel at the eastern base of the mountain within one-half mile of the C. & C. R. R. track, and run through Blind Spring Hill from east and west, tapping all the ledges in its course, or such as may go down to its level. It would thoroughly drain and divellen all the mines and give easy exit for all the ore for shipment by the railroad or to be worked at mills that may be hereafter erected convenient to the mouth of the tunnel. It will strike the following ledges in the order and at the depth named. The Moran at perpendicular depth of 200 feet, the Lyford at 800 feet the Cornucopia, 1200, the Wai Wera about 1200 and the Comanche at about 1,100 feet owing to a depression in the hill at its location.

A calculation has been made that the cost need not exceed $100,000, which is but a trifle in comparison with the vast treasures that may be very reasonably supposed to yet lie uncovered in this hitherto large storehouse of wealth.

A. C. K.

Benton, Mono Co. Cal.

Deadwood, Trinity County.

EDITORS PRESS:—I have noticed in your last issue that glowing accounts are being given of outside mining industries beyond the limits of California, and seldom do the public hear of the numerous mines being worked profitably in parts of our own State that deserve more than a passing notice. Should you permit me to trespass on your valuable space I shall try and give you an outline of the mining industry of Deadwood. This camp is located in the eastern part of Trinity county, in the Trinity range of mountains. Its altitude is about 3,000 feet above the level of the sea. A small rivulet wends its way from the foot of these mountains and empties into Trinity river, about five miles from its source. It was mined in early days for the placer gold it contained and yielded handsomely. Quartz mining has been going on here for the last 10 years, the old primitive arastra having made many an honest miner happy.

Recently several mills have been built of small capacities. McDonald Bros. & Co. put up a five stamp mill this summer, and in three months they have cleaned up nearly $100,000. Their ledge is from two to four feet wide, and all yields nearly $200 per ton. They have sunk a shaft 100 feet from their first tunnel, which they drove in the mountain, and the ledge is simply immense all the way down. Other properties in this district are now looming up. George Cloyne has a mill on his mine, and it yields him a splendid profit. Mr. Davidson also is extracting ore for his Cannon Ball mill. Another mill is being constructed by Mr. Murdock. Several others, too numerous to mention, have good properties here, but all of these men are practical miners. They need no capital to help them to put up an arastra, and when they realize enough out of the mine they erect a mill. Another property I forgot to mention is Mr. Lapan's. His ledge is about two feet wide, and in some places very rich. He also has discovered two cross ledges, which are running towards the main vein. He is now engaged in extracting ore to run his arastra as soon as the rainy season commences. The general formation of this district is porphyry and slate. All the rock contains a trace of silver, but not enough to notice. It contains no rebellious substances, so that an arastra, or plain gold mill, does the work to perfection. Should such a showing be made as we have here by some of our mining speculators, who try to make a boom where distance lends enchantment, they would have a mining town, mining companies formed, incorporating with capital stock 10 millions, and other Lady Bryan and Alta swindles would come to light, but the days of gambling in mining are over. By working mining properties in a legitimate manner we shall yet bring California to the front as a gold producer.

P. F. Mc.

The Concentrator Controversy.

At the request of Adams & Carlin, Pacific Coast agents for the Frue Vanner, we reproduce the following correspondence from the N. Y. *Engineering and Mining Journal*:

In your last issue, there was an article purporting to give results obtained at the Carlisle mill, in New Mexico, in a competition of the above-named machines on the tailings of a gold mill. While not denying that it is *possible* to so run a Frue vanner that a Duncan concentrator would give better results, I am able to give a few facts in regard to the special test quoted, that will be of interest to any one accepting the same as a real comparison of the two machines.

In the first place, the Duncan concentrator is a large pan, which has, according to its maker's description, "two motions—an irregular centrifugal, and an oscillating." The vanner it is not necessary to describe, nor its successful work on finely crushed mineral, as over 200 are at work in California alone on gold mill tailings, and have there replaced all other concentrators in general estimation. During the last 20 years, dozens of pan concentrators have been invented, patented and introduced, and, later, disappeared from view. They are all based on an hydraulic miner's idea of concentration, namely, that a gold pan is the ideal form, whereas all concentrator men, used to dressing slimes and finely crushed mineral, are aware that the gold pan is of little use, even in the most experienced hands, except on gold amalgam. So much as to the probabilities in the case of a test on stamp-mill tailings between a pan machine and a belt machine, when finely divided sulphurets have to saved.

Last fall our Denver agent visited the Carlisle mill, and found the Duncan concentrators in use. The ore was good, the sulphurets rich, and the tailings of the Duncan concentrators were also valuable. The field for improvement was so excellent that Frue vanners were offered on liberal terms to treat the tailings of the Duncan concentrators, and in October an agreement was signed with the Carlisle Mining Company, of which the following extract will convey the substance: "The machines (5) are to be paid for at the rate of ——— (the regular selling price at that time), for five machines, in the following manner: after the said machines are entered in the mill of the party of the first part, at the Carlisle mine, they shall be used to concentrate the tailings from all other machines now used for concentrating in said mill of said company, and the produce therefrom, less $35 per ton, shall be used and appropriated to the payment of such machines, until the said sum of ——— is paid to the party of the second part. And it is mutually agreed by the parties hereto, that if the said machines should not prove satisfactory to the party of the first part, he may at his option return the same by properly packing same and paying the freight on same to Denver, Colorado, or Chicago, Ill., and no payment shall be demanded by the party of the second part, provided that said machines are loaded on cars at Lordsburg, New Mexico, within 40 days from the time said machines are started in said mill."

The power of returning the Frue vanners was thus left entirely with the mining company; but in the final settlement no regard seems to have been paid to the letter of the agreement, our agent apparently being perfectly satisfied with the fact of machines not being returned, and hearing from one of the directors that they were doing exceptionally good work; the members of the company being also known as responsible men. Now, it seems from the article published by you, and contained in a circular distributed by makers of Duncan concentrator, that in a trial of the two machines at the Carlisle mill in the months of *February* and *March*, the Duncan machines proved vastly superior to the vanners. Yet the vanners were never returned by the Carlisle Mining Company, and on *February* 28th three more vanners were ordered from Chicago, and on *April* 7th two more were ordered. Curious result of such a test! especially as the vanners are more expensive to buy than the Duncan.

Two points about the test described may be noted. The value per ton of concentrations is a little higher for the Duncan than for the vanner. Any man who has seen the two machines run will open his eyes at this; and any one who has seen the vanner run will be scientifically interested to find that at last a concentrator has been found that will make sulphurets cleaner than pure. As to amalgam quoted in tests, the vanners were not ordered for saving this, as it was expected the amalgamator would keep it on his coppers; but even if, through occasional carelessness at battery or some special difficulty with ore, amalgam is expected at concentrators, we have long ago found that substituting a copper plate, having ½-inch rifles across top and bottom for ordinary pulp distributor on vanner, made the most effective amalgam concentrator possible to conceive, the shaking motion rolling it into small pellets under the rifles in a form impossible to lose again. For floured quicksilver, as witness the treatment of pan mill tailings, the vanner can not be excelled. On globular quicksilver, we admit being weak; it rolls down the belt when too large; but the mill man who can not save globules of quicksilver without a concentrator should direct his attention to some other business.

We shall be pleased to make a similar agreement as that above mentioned with the Carlisle Company with any mill having stamps, sulphurets that will concentrate to a value of at least $100 per ton, and using concentrators of the pan form, in not larger number than the vanners would be employed—say from two to five stamps. Yours truly,

WALTER MCDERMOTT,
General Agent.

Mining in Inyo.

In the mountains on both sides of Owens valley, there are hundreds of well-known ledges of gold and silver bearing ores that are not worked. Many of these ledges contain what would in other districts be classed as high grade ores. The claims are mostly owned by poor men, and in this fact the cause is found why the mines are not worked. Discoverers of the ledges were mostly men who had gained their mining experience in the placer claims or free gold quartz mines on the western slope of the Sierra. The same methods they had seen used for extracting gold were tried here but as the ores are entirely different, failure was a necessary result. Some experiments were made to discover a method that would extract the gold or silver from the ore, but for want of sufficient capital, these experiments were not carried far enough, and work on the mines was suspended. Many of the mining claims came into possession of parties in San Francisco and elsewhere, men who had money enough to experiment with, but it would appear that each was waiting for the other to make the experiments. In the mean time these parties maintain their titles to the mines by doing the necessary assessment work, so that they may profit by the boom that is sure to follow the introduction of a successful method of working these ores. It will doubtless be found that many localities which at the present time have received a hasty condemnation, and are idle and neglected in consequence of an unfavorable report, will, when a better understanding and knowledge prevails, be opened up and proven of most substantial wealth and value, when their real wealth and methods of working it have been mastered. It is true that a few mines in the county have produced millions of dollars, even with the imperfect means used for the extraction of the metals; but so far in the history of its partial development, it is as if a field which requires the most careful culture should produce a promising crop when no cultivation has been given. It would only be taken as a proof of the unusual richness and productiveness of the ground. So the results in the mining history of this county, instead of being taken as a measure of the returns to be expected from its development, should rather be received as an estimate of its probabilities and a proof of its great advantage, because as a matter of fact the results produced have been generally secured without the use of these things which are most necessary to its real and substantial development.—*Inyo Independent*.

Roger's New Steam Quartz Mill.

The new steam quartz mill built by Patrick Rogers, at Boston Ravine, started up for regular work yesterday, commencing on a crushing of rock from the Crown Point quartz mine. Ground was broken for this mill on the 15th of August and in just seven weeks it was ready for regular operations. The mill stands nearly opposite the mouth of Rhode Island Ravine, and is situated between the main road and Wolf creek, with the fall from the batteries toward the creek. The foundations for the batteries and engine are solid mason work built 12 feet in hight from the bed-rock. There are two five-stamp batteries with iron mortars, the stamps and stems weighing 800 pounds each. The batteries are fed by two Hendy self-feeders. The aprons to the batteries are covered with silver amalgamating plates, and the pulp passes from the sluices into Hendy concentrators, and the concentrations are worked through two Knox pans. A complete system of sluices is also connected with the mill, and everything is well and neatly arranged for doing perfect work. The power to drive the mill is an engine with cylinder of 12 inch diameter and 20 inch stroke; the boiler being a 40-inch tubular 16 feet long. The mill building is 22 by 80 feet, and the boiler shed 12 by 30 feet. In front of the batteries and running on a level to the road is a heavy and strong platform upon which to dump the quartz, upon which teams can drive to discharge their loads. Attached to the mill is a large yard for the storage of wood with which to run the engine. The builder of the mill was Jos. A. Everett, who has done much excellent work of this kind in the district. Patrick Rogers, the owner has superintended the general construction and will superintend the running of the mill. M. Calahan is the engineer and machinist. The mill is intended for custom work, and is well located for that purpose, being central to the mines of the district, and a point to which hauling can be done at the most favorable rates.—*Grass Valley Union*.

THE BULLION product of Tuscarora for the month of September, reaches a grand total of $90,572.58. Of this amount the Najavo shipped $65,072.58, and the Grand Prize $25,500.

MECHANICAL PROGRESS.

Hidden Flaws in Metal.

What is really needed, says the *London Builder*, is some system, could such be devised, by which those hidden flaws which the very best metal made by the very best process will sometimes contain, should be rendered patent to the eye of an inspector. Is there any chance of such a system being devised? It is clear that chemical tests are quite useless; they can tell nothing but the general composition of the metal. Electrical tests may possibly yet be used with effect. They were proposed some years ago, and have been revived lately by Prof. Hughes, the inventor of the microphone. With his beautiful instrument, the "magnetic balance," he has proved that in wires or small pieces of iron, almost all peculiarities of the metal, including the existence of flaws, can be detected with ease and certainty. His invention has been freely given to the world, but heretofore the world (as usual) has been wholly indifferent to the gift. So far as we are aware, no railway or marine engineer has taken any steps with a view to ascertain whether a similar system might not be applied to pieces of large size, such as those required in actual work. Failing this, mechanical tests in a proper testing machine do not seem impossible. If the axle which broke at Penistone, before having been set to work, had been subjected to a sudden cross-breaking strain, similar to that which caused its destruction, but very much below what it should be able to support with safety, we cannot doubt that the resulting deflection or bending would have been far greater than if the axle had been sound. What we would suggest, therefore, is that all crank axles, or other pieces of metal called to fill equally important positions, should be tested by strains similar to those brought upon them in actual work, and that their deflections under those strains should be recorded. A few experiments would be sufficient to show clearly how great this deflection should be in the case of a sound and perfect axle; and if any specimen showed a deflection decidedly higher than the limit, it should be rejected as a doubtful quality. The expense of such a system would not be great when it once became a regular part of the manufacture of an axle; and it appears to us the only method by which a single faulty specimen can be weeded out from a batch of sound and satisfactory articles.

Making Changes in Machinery.

How easily, says the Boston *Journal of Commerce*, a workman can recommend a change in the working parts of a machine, after everything has been adjusted and left in working order by those who were sent with the machinery from the works of the builder, and how easily he can make the attempt to correct the apparent disorder by making a few slight improvements. Machines have been delivered with full instructions for running them, and been returned for the reason that there were working parts that were left in doubt by some additional improvements. The engine lathe, with a dead center that could be easily removed by running back the spindle with the hand wheel, must be drilled for a pin wedge by the lathe man before he finds out that such a thing was not needed. Cutter-heads with the driving spindle have been boxed up and shipped for the purpose of having a collar to guard against an end movement, where the builder had made provisions for this very difficulty by turning V grooves in the bearings of the spindles. And so with the machinss for the working of cotton. Some familiar part must be entirely remodeled so as to accord with the ancient idea with which the attendant is more familiar, and often costly attachments may be found laid aside which were intended for a purpose, with the use of which no one was acquainted; and even machines have been fitted for different grades of material, by making some additional arrangement in the working of the machine, when all the while provisions were made for this very purpose. When the machinery from a reliable firm will not operate in accordance with the notions of the attendants it would be proper to inform the parties whose interests lie in the proper working of the machine, and let them remove the difficulty, if any exists, and explain some of the mysteries of the one-sided catches that have been made use of, that the production may be benefited as well as the workmen, without discredit to either.

On Working Steel.

A correspondent of the *Blacksmith and Wheelwright* writes that journal as follows: Allow me to express a few thoughts in regard to the degree of heat, steel should be worked for edge tools. And in doing so I shall no doubt differ with many; but what of that? If we all had one way of doing work what would be the use in giving "*our method*" for doing anything? Some tell us that steel should never be heated above a cherry-red, others say it should not be hot enough to scale, and many suppose if heated to a white heat the steel is hurnt and is utterly worthless. Now, if all this be true, how in the world can an edge tool ever be made, and of what practical use would they he when they *were* made?

Can steel be put into an ax or any other tool without heating the steel above a cherry-red heat? If so, I would like to have some one tell me how, as I have never learned that part of the trade. It will be of no use to cite the "cherry heat welding compound," as I have had a box of that in my shop for years, and would be glad to dispose of it at a low price, unless the manufacturer will come and show me how to use it. I do not believe that iron or steel can be welded at a cherry heat.

My experience in the working of steel during the past 15 years has been mostly confined to the ax business. I have made and repaired during this time several hundreds of axes, and the work has given unparalelled satisfaction. My experience in the matter has convinced me that the degree of heat steel should be worked, depends very much upon circumstances. For instance, if I am going to fix over an ax, and wish to reduce the steel to one-half or three-fourths of its present thickness, I have no fears of any bad results if the steel is brought to a white heat to commence with. But when nearly to the acquired thickness, I am careful not to heat above a cherry-red. And when the last or finishing touch is given by the hammer it is at a low heat, when but a faint red is discernible. I never finish forging an edge tool of any kind at a cherry-red heat. The finishing should be done at as low a heat as to refine the steel and leave it bright and glossy. In heating to temper the greatest care should be observed that an even cherry-wood heat is obtained. I do not deny that injury may occur by overheating. This every smith knows to be true; but I *do* claim that it can be remedied, and the fine grain of the steel restored when the nature of the work will admit of a suitable amount of forging. When it will not, I never heat above a cherry-red. Come, friends, let us hear from you on this and other subjects. Supposing we do make blunders and expose our ignorance once in a while. We may become enlighted and do better, as no one is too old to learn.

DIAMOND TURNING TOOLS.—It is sometimes desirable to reduce the dimensions of a hardened steel article that has received a lathe finish without first drawing the temper, as this necessitates a rehardening and retempering. The usual method of lathe reducing of hardened steel articles by corundum wheel grinding is necessarily confined to straights or tapers, no offsets, collets, or shoulders being amenable to this style of work. A model maker and bright mechanic has succeeded in utilizing the black diamond, or bort, as a turning tool for hardened steel. He places a crystal in the end of a piece of iron or brass for flat turning, and one on the side of the end, or on a corner of the end, for side or shoulder turning. He has succeeded in doing some good work with these crude-looking tools. The chips taken from the hardened steel are litsrally chips, not turnings, and are very minute. But viewed under the microscope they are seen to be cut from the hardened steel, and not merely disengaged crystals. One of the specimens of work with these bort tools is a well finished V-thread, about 32 to the inch. Two differing crystals of the diamond were employed to cut and true the thread. An adaptation of hort tools to the planer is evidently possible, and there seems to be no reason why its use might not be extended with economical results in the treatment of hardened steel and of chilled iron.—*Scientific American.*

COVERED AND UNCOVERED BOILERS.—In order to ascertain the degree of advantage obtainable by felting and lagging steam boilers, Mr. B. H. Thwaite has carefully carried out the following experimeuts on a Bull type of vertical boiler: A definite quantity of water was poured into a vessel of a size sufficient to cover one square foot of plate surface, the vessel being externally lined with wood. The rise in degrees of heat during the hour's exposure was noted. The same weight of water, with identical initial temperature, was then placed for the same time on the surface of the lagging, which consisted of three thicknesses of three-eighths inch felt, covered with one-half inch tongued and grooved battens. On the naked plate it was found that 516·75 heat units per square foot were absorbed by the water; and on the laggard portion only 145·75 units per square foot were given off. This is equivalent to a reduction of wasteful radiation, due to the lagging, of 34 per cent, or with a vertical boiler, say 4 feet in diameter and 9 feet in hight, working for 10 hours, there would be saving, due to the lagging, of at least 70 pounds of coal.

IMPROVEMENTS IN STEAM ENGINES.—A writer in one of the mechanical journals expresses the opinion that, taking the best types of steam engines at the present time, some departures are called for in order to realize still greater efficiency and economy. Among the most important points made by this writer is that of the necessity of increasing the ability of the boiler to withstand pressure without adding to its cost, rather than augment its comparative power; also to decrease the friction of the engine and of the transmission to the point where the useful work is delivered. In addition to these requisites, it is urged that better vacuums should be produced in the condenser, and its cost diminished; the expense of the engine must also be lessened, as well as that of the attendance, alike on engine, boilers and machinery, and of lubrication; and there is likewise a greater degree of durability called for in construction.

SCIENTIFIC PROGRESS.

The Philadelphia Electrical Exhibition.

The International Electrical Exhibition recently given under the direction of the Franklin Institute was, by universal admission, the most valuable and successful exhibition ever undertaken by private enterprise in the United States, when considered from an educational standpoint. The *Journal* of the Institute says of it: "The direct value of the Exhibition as a means of education has been utilized to the highest possible degree. The Board of Public Education of the city of Philadelphia has directed each of the schools of and above the grade of grammar school within its control, to take a day to visit the Exhibition with its teachers, in lieu of a school session; and, in response to invitations sent by the officers of the Exhibition to the directors of schools within a radius of one hundred miles, embracing Eastern Pennsylvania, New Jersey, Delaware and Eastern Maryland, a large number of pupils with their teachers have availed themselves of the opportunity of visiting the Exhibition. To assist to an intelligible study of the machinery and apparatus, a series of "Electrical Primers" was prepared, giving in simple and readily comprehensible language, explanations of the principles, construction and operation of the principal groups of exhibits, and placards were posted conspicuously in the neighborhood of characteristic machines, etc., to identify them by name to those to whom they were unfamiliar. The primers, which were issued and sold at a nominal price, proved their usefulness by an enormous sale.

The educational character of the Exhibition was furthermore pronounced by a series of lectures given twice a week in the large lecture hall. These lectures, which were delivered by men of eminence upon topics related directly or indirectly to the subject of electricity, were listened to by crowded audiences and proved to be highly popular. They will be published in a special volume."

ELECTRICITY A TRUE FLOW AND NOT A MERE VIBRATION.—According to the French *Annals of Chemistry and Physics*, Decharme has instituted some experiments showing a hydrodynamic imitation of electric phenomena. He imitated by liquid or gaseous currents, the principal phenomena of static and dynamic electricity, electromagnetism, electrodynamics, induction, electrochemistry, and even electrophysiology, concludes that electric and magnetic phenomena are similar to hydrodyuamic phenomena; in other words that electricity, under the form of an æthereal or ponderable current, is analogous to a liquid current, and, when in a state of tension, resembles a quantity of liquid diffusing in a jet. Electric movement is then a true flow and not a mere vibration. Its equipotential lines may be exactly represented by Lame's differential equation for the curves of hydraulic level. There are some electric phenomena, however, which appear to be the result of vibratory and gyratory movements; but these movements naturally result from the transformation of wave motion in a continuous current.

IMPORTING AMERICAN GRAPES INTO FRANCE.—Ch. Joly has presented a paper to the *Societe d' Horticulture*, upon the importation of muscat grapes from the United States into France. The grapes were preserved in an aqueous solution of glucose. The attention of the grape growers of France and Algiers is invited to the important consequences which may follow this importation. The United States, outside of their enormous grain trade, have hitherto been limited to the export of fruits prepared by a previous drying, which removes about 28 per cent. of the water that they contain; this operation has the double advantage of diminishing the weight to be transported and of facilitating the preservation of the fruit. M. Joly, while calling attention to the danger of an interference with the French grape trade, urges cultivators to increase their productions as much as possible, chiefly by the rational amelioration of their methods of culture.—*Nature, May 3.*

HATCHING CHICKENS BY ELECTRICITY.—According to *Nature* an interesting experiment in the use of electricity in hatching chickens has recently been tried at Berlin. A basket was provided containing a nest of hay, properly covered and provided underneath with a thick pillow which contained a metallic spiral. A battery of six cells furnished the electricity for warming the spiral, the current passing through a lever regulator. A small thermometer was inserted with the bulb in the nest, and a fine platinum wire soldered to the tube. When the temperature became too high, the mercury would rise and touch the wire, forming a contact which would throw the apparatus out of circuit. When it cooled again the current would be restored and the temperature raised. By this device an approximately even temperature was maintained by which the hatching was perfected.

MAGNESIUM VS. ELECTRIC LIGHT.—It is stated that magnesium bids fair to come into important use as a light producing agent for marine purposes, as it is found that its rays have a greater penetrating power in fogs and mists than even those of the electric light. It may be interesting in this connection to state that M. Gratzel, who has recently obtained a patent for the separation of alkaline metals by electrolysis, has been very successful in the reduction of magnesium. At a late sitting of the *Electrotechnische Verein*, in Berlin, a ball of magnesium, of about 15 centimeters diameter, excited general attention. It was of superb brilliancy, similar to that of silver, and had lost nothing of its lustre since its separation by electrolysis. This preservation is a sign of its chemical purity, and forms a remarkable contrast with the magnesium hitherto obtained, which was always more or less affected by potassium, and consequently easily oxidized, especially in a damp atmosphere.

THE SEA LEVEL.—Of late years automatic instruments—tide gauges—have been used for registering the level of the ocean at stated periods. All the principal European Governments and our own are engaged in these observations and measurements. The French Commission has begun a work of this kind, which, it is said, will surpass anything of the kind hitherto undertaken. In Belgium measurements have been made for 8,477 different locations. The measurements have been made in Holland with the greatest exactness. The level of the north sea has not varied for 250 years. The level of the Baltic is the same as in 1826. An interesting point will soon be determined as to the difference of level between the Baltic and Black seas. The Spanish operations have shown that the Atlantic ocean, at Santander is 0.582 meters above that of the Mediterranean at Alicant.

A NEW GAS BURNER, invented jointly by the late William Siemens and his brother Frederic, has recently been perfected by the latter, and is now known as the "Siemen's regenerative gas burner." The principle of the invention consists in heating to a high degree both the air and gas previous to combustion, the heating being effected by the waste products of the combustion. The great merit of the invention consists in a great increase of illumination with a diminished consumption of gas. It is claimed that with a jet which, burned in the ordinary way, will yield only three or four candle power, will, by the use of this new device, yield a 10-candle light. It is claimed to be a decisive step in advance in the use of gas, and one involving several novel and scientifically correct principles.

ARTIFICIAL GRAPHITE.—According to a French journal, Dr. Aron has exhibited, at the meeting of the Berlin Electrical Society, various specimens of vegetable carbon, which were made conductors and rendered almost incombustible by energetic and prolonged heating in a vacuum or in a neutral atmosphere. These properties are so much like those of graphite that the product may well be called artificial graphite, although it is not crystalline. The experiments show that if, as has been affirmed, the presence of hydrogen in graphite determines its combustibility, this can be true only of combined hydrogen, for carbon which has been calcined and made incandescent in an atmosphere of hydrogen is no more combustible than before.

REMARKABLE PHOTOGRAPHS.—Some remarkable photographs of a pistol bullet in its flight, under the illumination of an electric spark, has been secured by Prof. E. Mach, of Prague. He has also photographed the air streams which one may see over a Bunsen burner placed in sunshine; and has even obtained pictures of *waves of sound*. These last being made visible by a method in which advantage is taken of the irregular refraction of light by the waves set in vibration by sound. Although these experiments may not have any practical value, they are interesting as showing the great degree of perfection to which the photographic art has been carried.
